6415. You do not know what has been done?—Not exactly at this moment.

6416. Have you been much in barrack rooms at night?—Not in this country, I have been a good deal when abroad.

6417. Do you know the state in which the atmosphere gets?—Yes, and it is very bad indeed.

6418. Must that not necessarily be a very great source of disease?—I have very little doubt of it; I cannot understand any other reason for the mortality being so high, unless it arises from that cause.

6419. There is more ophthalmia in the army, is there not?—Yes.

A. M. Tulloch,
K.C.B.

29 June 1857

Colonel Sir
A. M. Tulloch,
K.C.B.

29 June 1857.

6420. Is not that produced by a bad atmosphere ?
—I have heard another cause recently mentioned as producing it, and that is, the sameness of diet.

6421. Therefore you would set down ventilation, as one cause ; dissipated habits, another ; want of muscular exercise in the infantry another ; and, as another, do you attribute much of it to night duty ?
—The night duty is so regulated, that I do not think there ought to be much evil from it ; we do not find that the police suffer much from night duty.

6422. But their service is shorter ?—Yes ; but then, in London, the police do duty the whole night.

6423. The service is more severe, while it lasts ?—Yes ; but if the night air in this country tended very seriously to prejudice health, one would suppose that they would be affected.

6424. The police are on duty eight hours consecutively ?—Yes.

6425. And every night ?—Yes.

6426. The police divide the time into day and night ?—Yes ; there is a certain number who choose to be on duty at night, wishing, as I am told, not to be recognized during the day as belonging to the police.

6427. (*Dr. Andrew Smith.*) Is there not more danger from a man going three or four times in a night upon sentry out of a warm guard room, than being continuously out in the cold air all night ?—I cannot say, but were it so, the best way would be to keep a soldier out all night ; and if you did so there would be an outcry against it, as injurious to health.

6428. The variation of temperature to which a soldier is exposed during a long winter's night, three or four times, must be hurtful ; he goes out of the guard room, perhaps perspiring, and mounts guard, and gets chilled ?—It is quite possible ; but if you admit that principle, the best way would be, to keep him out all night.

6429. (*President.*) If the soldier suffers from that night duty, in consequence of going to sleep in a very hot guard-room, and then suddenly going out into the open air, is not that a preventible cause ?—Yes, certainly ; and it might be a question, whether they ought to have fires in the guard-room. I know that they are very apt to over-heat these rooms, it is always the case with soldiers if they can.

6430. They put on their great coats to lie down in, in order not to soil their uniforms ?—Yes, and also for covering.

6431. They go to sleep and probably perspire ?—Yes.

6432. Then they are awakened to go out on duty ?—Yes, but the night duty is comparatively slight. I went very closely into that to ascertain what the exposure was, and I think it was only one night in four, in the Foot Guards.

6433. (*Mr. J. R. Martin.*) Your impression is, that as a cause of disease it is comparatively unimportant ?—I think so, and it must always be borne in mind that such a cause would operate everywhere in very nearly the same way. Yet we do not find the mortality so great in Canada, where the troops are much more exposed than anywhere else in winter.

6434. (*President.*) But there is not so much night duty ?—Yes, they had during war time, and yet the Foot Guards did not suffer to any great extent then.

6435. Do you see any remedies for these causes of disease ?—One remedy is clear. If I were going to build barracks I should build them as detached houses to contain only 10 men, and thus put the troops in nearly the same condition as the agricultural population from which they are taken.

6436. (*Mr. J. R. Martin.*) In imitation of the hutting principle ?—Yes.

6437. (*President.*) That would be very expensive, would it not ?—I doubt it ; for the cost of the barracks at Aldershot is 140*l.* per man, but for much less than 140*l.* you could put up a very fair cottage which would contain 8 or 10 men.

6438. But that is not a fair comparison. The amount of the cost of a barrack, which goes to the actual accommodation of a man, is only one-fourth of the whole, and you must consider that there are officers' quarters, and a chapel, and a school, and a ball court, and a wall round it, and all that you must throw out of consideration ?—I should be very ready to do so, and take it at 40*l.* instead of 140*l.* ; this for ten men would allow 400*l.*, and a house in one of the cross streets here with eight or ten separate rooms would cost no more. The advantage of having one roof and a large building as being cheaper was urged against me in the committee of which I was a member for arranging the description of buildings to be erected at Aldershot. I was placed on that committee by Lord Hardinge when Aldershot was bought ; and when I found that there was clay under the surface, that bricks were being made in the neighbourhood, that there was abundance of gravel and sand, and a description of small wood which nobody would buy, about 7 or 8 miles distant, at Sandhurst, I proposed that small huts fitted for 10 men should be put up with these materials by the soldiers themselves, as had been done at Maroon Town, where the accommodation cost only 25*l.* per hut, and lasted six or seven years ; but that proposition was negatived, though I contended that 20 or even 10 years might totally alter the state of the country, and render a different kind of accommodation necessary from the expensive permanent barracks which the rest of the committee contended for.

6439. You look upon bad ventilation as one of the chief causes of disease ?—Yes, and the men being in masses ; if there were only ten men with a non-commissioned officer, and free ventilation round each hut, I think it would be an improvement.

6440. But you may have men massed together without bad results, as is shown by the good health enjoyed in prisons, where the building is well ventilated ?—Yes ; but men in the army are in a very different state from those in prison ; their diet and their labour are regulated in a particular way, and perhaps there are very few conditions in which a man is likely to live longer than in a prison.

6441. Except the monotony of that state ?—Perhaps that may tend to prolong life ; some rather think that our lives are shortened by excitement.

6442. (*Mr. J. R. Martin.*) Referring to the night duty, has not the comparative healthiness of the drummers been everywhere observed, and has not the cause of that been stated to be their exemption from night duty ?—Yes ; I pointed out that in one of my reports, and it was in order to get at that fact that the drummer rank was taken separately in my results.

6443. And the non-commissioned officers ?—Yes. The drummers mount guard, but they are not much exposed to night duty ; they only go round with the officer.

6444. (*President.*) The serjeants sleep in separate rooms, and they are older men ?—Yes.

6445. Being older men ought to tell against them ?—It ought. The mortality among them, however is, I think, rather lower than among the rest of the troops ; but they have advantages in respect of quarters and diet. Among the drummers the mortality is low ; but they are usually the youngest of the troops.

6446. (*Mr. T. Alexander.*) Have you not observed in many instances that when a soldier is discharged he is much younger looking than he was before ?—Yes. It is a most important fact that men who have been discharged when past forty, after having served in various parts of the world, though no doubt much broken down when they were discharged, regain their health wonderfully after being a year or so at home in their native place.

6447. (*President.*) That is, if they do not die ?—Yes.

6448. (*Mr. J. R. Martin.*) Is it not rather more a matter of appearance than of reality, the soldier having a comparatively youthful appearance from more

regular sleep and not having been hard worked anywhere?—I do not know what it is from.

6449. (*Mr. T. Alexander.*) Have you not observed that a soldier who has been an officer's servant does not age so much as a soldier who takes his regular night duty?—I could not say that.

6450. (*President.*) Does the officer's servant sleep in the barracks?—No.

6451. (*Dr. Andrew Smith.*) With regard to night duty, when disease was so very severe in Hong Kong, when more than two-thirds of the men were sick, are you aware that the greater part of those who were admitted into hospital came off night duties?—I am quite well aware of that. In the West Indies, where epidemics prevailed, and there was considerable sickness and mortality, the greater proportion of the sick came into hospital after being on night duty.

6452. (*Mr. J. R. Martin.*) In malarious countries that observation is universally made?—Yes.

6453. (*Dr. Andrew Smith.*) It was then recommended in consequence of that being the case to employ a police, so as to diminish the number of men on night duty, and that was followed by very happy effects, the bandsmen, officers, and drummers, not suffering in proportion with the men who had to go on sentry for two hours, and then off again, and so on; nor did the natives suffer in the same proportion?—With regard to the natives they are often exempt from causes which severely affect troops who are not natives. But I have no doubt that at such a place as Hong Kong, where the men suffered much from sickness, it was a great object to exempt them from night duty, the human frame being more subject at night to the influence of malarious disease than at other times.

6454-5. (*Mr. J. R. Martin.*) In such countries the native troops should be employed for night duties?—Yes, where you can; of course that does not apply in this country.

6456. (*Dr. Andrew Smith.*) In this country, where a great number of sentries are employed in dock-yard duty which is very severe, with regard to the proportion of sick afforded by those regiments, are you aware that that is generally much greater than the proportion afforded by regiments in the interior of the country?—Yes, but there are other reasons for that. It is necessary to discriminate the diseases. In all those seaport towns there is much greater tendency to, and greater facilities for drunkenness, much greater tendency to venery, and much greater facilities for it; and if you take those two causes into account, I do not think the difference in health will be found very great, but, however, I think it is well worthy of being closely examined.

6457. Are you not aware that fever and pulmonary disease, and diseases of the eye, which cannot depend very much upon drinking, are much more common where dockyard stations exist, or at Dover heights, than in the interior of the country?—I am not aware that they are; I think, if there had been any very marked difference it would, in making up the report of the sickness and mortality among the troops in the United Kingdom, have caught my attention. There was more disease from fever at Portsmouth and Chatham; but in Chatham a very large mass of troops are congregated, and ophthalmia is more readily communicated where you have six or seven regiments together, than at a station in the interior, where there are perhaps only two companies.

6458. Is there not a very great proportion of men, particularly those suffering from pulmonary diseases, discharged before they have been three years in the service, or about that time?—There are considerable numbers, and for this reason, that the facilities for discharging them without pension before three years have expired, are greater than at any other time. It frequently happens that you discharge a man who has been only three years in the service, because he is not likely to make a smart soldier.

6459. On some account, that account being ascertained?—Yes, no doubt a great number are discharged under three years.

6460. Is it not, in your opinion, in any way connected with the hard drill to which men are exposed, and is not pulmonary disease brought out when it would have remained dormant for years and years had the man continued in private life to work at his ordinary trade, whereas the drill forces it out at once, and the disease is developed by the drill alone?—I cannot really say, for I do not know sufficiently well the structure of the human frame, but I should have fancied that military drill would rather tend to set up the frame; it usually develops the muscles, and I think in the East the practice prevails not merely among the military, but among the natives, of developing their muscles by much the same kind of exercise.

6461. (*President.*) Are you acquainted with the French system of gymnastic exercise that they make all the troops go through?—I do not know much about it, but I should fancy that it is something similar to drill.

6462. They make them climb up poles?—Yes.

6463. Every soldier is made to go through it?—At any rate the light troops are; I was not aware that every soldier was; all the voltigeurs are.

6464. Have you heard that the French medical officers attach a great deal of importance to it, as it strengthens the men?—I presume so.

6465. (*Mr. J. R. Martin.*) Are you aware that Dr. Robert Jackson, the great army physician, recommended systematic courses of gymnastic exercise, ball and hammer throwing, leaping, and swimming?—Yes.

6466. You are probably aware that the same great authority suggested, so far back as 1803, the benefits that might be derived from well-arranged military medical returns, and that he furnished examples of such returns?—Yes, I believe he did, and there is no doubt that they are of the utmost importance.

6467. (*President.*) What is the latest date of your reports?—The one before me terminated in 1853, and I may state that we would have gone on with them, but in 1854 the war commenced, and from the commencement of the war I was employed in various ways in selecting all the pensioners that could be made available for the navy or the army in any way, or for the coast guard service or convict guards, and from that time to the present I have been otherwise constantly occupied.

6468. When will another report come out?—I hope next year, but it must depend on what time can be spared for it from my duties as military superintendent of pensioners.

6469. Are any means taken for their diffusion or publication, so as to give the results generally to the public?—Being parliamentary volumes, I think 2,000 copies of each have been thrown off; there has been a very considerable demand for them by the medical men throughout the country, and three or four hundred copies were furnished to the medical officers of the army; some have been sent to foreign countries, and there translated, and there was some years ago a great deal of discussion in the French Chamber of Deputies as to the expediency of having the same system introduced into their army.

6470. Is there any annual medical sanitary report which contains or analyses the reports of the army medical officers?—None; but for sanitary purposes, I rather doubt whether an annual report would be of much service. The object of statistics is to accumulate facts from a long period of time, and then to draw deductions from a broad basis in which all minor errors disappear.

6471. But if you had annual statistics you need not draw your theory from any one annual report?—No; if care be taken in that way there can be no objection to have them annually. I may mention that till the late war it was always my practice to prepare for the Secretary-at-War an annual report showing the loss for the previous year, the details of which were usually communicated by him to Parliament at the time of passing the estimates.

6472. Do you think it would be possible to give the rates of mortality in the whole army?—Yes; quite

Colonel Sir
A. M. Tulloch,
K.C.B.

29 June 1857.

Colonel Sir
A. M. Tulloch,
K.C.B.

29 June 1857.

possible, and the rates of mortality at every station. I had intended whenever I had completed the next ten years to have thrown the contents of the whole volumes together for 40 years, and to have drawn deductions therefrom on an extended scale.

6473. I am afraid that the rates of mortality would show very ill if you took the whole army together?—General statements of that kind are of comparatively little utility; it is the separation of the mortality according to stations and classes which leads to the best means of checking the loss. In the West Indies, for instance, it was always known that the mortality was very heavy; but the white troops and the black troops had been mixed together, as well as the different stations; one general average was taken, which showed a loss of about 6 per cent.; but when we came to examine into the particular places where the mortality occurred, we found that the mortality was, in some, 16 or 17 per cent., and at others only 3 or 4; that in some the black troops suffered very little, and the white troops a great deal, so that we were thereafter able to have the black troops placed where they suffered the least, and the white troops arranged in the same way.

6474. That would not lead to any inaccuracy in the whole. You would have a system of tables marking the difference between the white and the black troops?—Yes. But when you give all the details of the out-stations, there is less fear of making any mistake; If the mortality of the whole army were given, I do not think that the average would be more than 3 per cent. over all the various stations, as you have a very large proportion at home, and in healthy colonies; this would not give you any idea of the mortality in India, which has averaged 8 per cent., or nearly so, for 40 years.

6475. In addition to a table showing the mortality at each station, there should be one giving the whole mortality?—Yes; that might be of use as a general statement, but it would not lead you to the changes required, being what are chiefly wanted.

6476. Looking upon these statistics as having been of immense advantage to the army, I want to know whether by a more frequent repetition of them the advantage could not be still farther increased, as it would be a great thing for the military authorities to be able to watch the rates of mortality and attempt to apply remedies?—That is not neglected. There is a return received at the War Office monthly from Dr. Smith, stating the loss every quarter at all foreign stations from which the returns have arrived, and the loss at home for that month, together with the strength. It is my practice to compare the strength and loss as there detailed with the adjutant-general's returns, and to notice any important differences; also to show where the mortality has exceeded the usual average. The return then goes before the Secretary-at-War, who calls for any further information that may be necessary, and thus has always at hand information on the subject, in case of any notice being taken in Parliament about heavy losses by climate or otherwise.

6477. In the same way as in London, where there are two millions and a half of people, they publish a weekly account of the deaths?—Yes.

6478. And they publish a quarterly account of the mortality in England and Wales?—Yes.

6479. Could not a quarterly account be made up, of course in arrear, on account of the distance of some of the stations, of the mortality of the whole army?—Yes; but I do not think you would derive much benefit from it. Dr. Smith, as I have already stated, gives a summary of the quarterly returns arriving in each month; the Secretary-at-War has that, and I think that a return annually would be as often as is necessary for general purposes; such a return is made up for him, annually, previous to the estimates, from the sanitary returns, so far as received. It has often occurred to me, however, that it would be a very good thing if that were handed to the medical board, to

have a summary of all the information that has been obtained from the medical stations abroad relative to the origin of the diseases, and their treatment added to it, for professional purposes.

6480. The organization of the army gives you great facilities for obtaining accurate statistics?—Yes; you not only get returns from each regiment but from each station, and can trace the men from one station to another; you also know the medicine that is prescribed, and that the men take it, which is not the case in civil life.

6481. (*Mr. J. R. Martin.*) In civil life you have no history of the disease, nothing but the ultimate result?—No; and you do not know how that ultimate result has been produced.

6482. (*President.*) In your quarterly statements to the Secretary-at-War, you give not only the actual rates of mortality and the amount of sickness, but the causes of sickness?—These are stated usually by Dr. Smith, and I calculate the per-centage.

6483. So that you could see what fatal influences each regiment has been exposed to, and what is its sanitary condition?—Yes, and that goes on for the the foreign stations every quarter.

6484. You get the same thing at home, do you not?—Yes, monthly; but I very seldom go into the results at home, as the troops are moving about so much, that it would be difficult to draw accurate conclusions from the returns.

6485. Do you think there would be any difficulty in making a complete return, if necessary?—No; at a year's distance or thereabouts, if it was of any importance; but I think for statistical purposes ten years would be better.

6486. But if the public were fully aware of the degree of mortality that exists in the army, there would be less difficulty in getting from them the means of remedying the bad sanitary influences which affect the health of the army?—The public mind has been drawn so much of late to that subject, I should hope there would be no difficulty now.

6487. (*Mr. J. R. Martin.*) But towards the end of a 20 years' peace, that feeling would be very much diminished?—Perhaps. There is one subject deserving particular attention, viz., the long service abroad, which increases the pension list at home to a very considerable extent. 16 or 17 years' service in the East Indies is too long; it is quite sufficient to break up the constitution of a man, and make him unfit for service elsewhere; every effort should be made to reduce the period of service in the East Indies to 6 or 7 years.

6488. (*President.*) What is the period of service in the East Indies professedly?—Professedly it is 15 years, but it is actually, I think, 18 or 19.

6489. Some of the lancers who came back had been out 21 years?—I think they had. There is nothing that appears more necessary with reference to the pension list than not to retain soldiers too long in an enervating climate.

6490. In the colonies the turn of service is 10 years, is it not?—Yes, in healthy colonies; only three years in the West Indies, three years in the Mediterranean, and three years in North America.

6491. You would like to put the East Indies on the same footing as to duration of the period?—Seven years there I think would be long enough; and the facilities of transport of late years would admit of your doing so with economy. I think you would save the constitution of the men, and that they would not be worn out in the way they are there.

6492. When regiments are coming home, some of the men volunteer into other regiments?—Yes, but I think it would be good to prevent that volunteering; though if a man has served 16 years, and knows that he is not fit for home service, it is perhaps better to volunteer into another regiment and complete his 21 years, than return home to be thrown at an early age on the pension list.

6493. (*Mr. J. R. Martin.*) Do not the soldiers object to come home after long service in the East Indies?—Yes.

6494. (*President.*) Do they intend to stay in India?—No. They remain there till they have acquired a right to the pension. If they came home under 14 years they might be discharged without any pension at all, and if discharged between 14 and 21 years they would only get a modified pension of 7*d.* or 8*d.* a day. There seems no difficulty now in relieving the troops in India by the Mediterranean and the Red Sea. In every case it would be a good thing to have the reliefs more frequently.

6495. In forming your statistics you get the materials from the army medical department to a great degree?—Originally I got the materials altogether from the army medical department, but latterly, since we have had sanitary reports, I get the materials from them. Whenever I see any large amount of sickness under any particular disease, Dr. Balfour, who assists me in everything connected with statistics, and has been associated with me in all these inquiries, reads the reports upon that particular crisis, to ascertain when it commenced, when it ceased, and what measures were adopted, all of which particulars are then detailed in the printed report for Parliament.

6496. Do you obtain any assistance from the published reports of the army medical officers?—No. I think very few of them are published. I read occasionally the reports which are sent home in manuscript.

6497. (*Mr. J. R. Martin.*) You check also the accuracy of the statements derived from the medical returns by the War Office returns?—Yes.

6498. (*President.*) Writing statistics forms no part of medical education?—I presume not, when I had to take it up.

6499. (*Dr. Andrew Smith.*) Are you not aware that Sir James Macgrigor, long before these reports were commenced, had been constantly endeavouring, through the Secretary-at-War, to get a board appointed for the purpose of analyzing and seeing what could be done with the records of his office?—I have no doubt of it. I think I remember one or two letters on the subject. The medical profession is, I conceive, deeply indebted to Sir James Macgrigor for having collected those materials; and I have no doubt he would have had them brought into shape long before, had the required assistance been afforded.

6500. Have you not heard that he was impressed with the importance of the subject, and that he endeavoured from time to time to get a sufficient number of medical officers attached to the army medical department to prepare reports of the kind?—Yes.

6501. And he was refused on account of the expense?—Yes. And had I not obviated that difficulty, it would perhaps have proved a barrier to the reports ever being published. When I was engaged upon them I for a year or two got nothing, but I saw it was a matter of very great importance, and I hoped that beneficial results to the army and even to myself would be derived, in which I have not been disappointed.

6502. (*Mr. J. R. Martin.*) In fact, you commenced as an amateur?—Yes.

6503. Eventually you became a public functionary in that department?—Yes.

6504. (*President.*) As the sanitary state of an army contributes very much to its efficiency in the field, in peace, you say, since your attention was called to the subject, the rates of mortality in some of the colonies have been diminished; suppose the rate of mortality could be reduced by proper sanitary precautions, to the same amount as in civil life, would not that have a very considerable effect, both on the expenses of recruiting, and on pensioning?—There is no doubt of it. In every way that you reduce the mortality on foreign stations, you diminish the expenses for recruiting, and for every man you save you gain 20*l.* or 30*l.* at least.

6505. (*Mr. J. R. Martin.*) In the East Indies, and the more remote colonies, the actual prime cost of a soldier has relation to the distance to which he is to be transported?—Yes.

6506. In the East Indies, the expense has been always reckoned at 100*l.*, including the cost to the state of training his substitute?—Yes; but I should think that that is a high valuation, and better fitted for former days; I should say at least 50*l.* or 60*l.* would be a fairer amount.

6507. As stated by you, on your last examination, the amount in money lost by the unnecessary sacrifice of human life, in the East Indies, would come to many millions?—There is no doubt had it been politically practicable to keep the troops at healthier stations, a great saving of life, and consequently of money, would have resulted; but the intelligence from India, within the last day or two, shows how much other considerations are connected with that question.

6508. (*President.*) The greater the health and comfort of the soldiers are, the more easy the recruiting would be?—Yes.

6509. Have you made a calculation as to what the soldier's wages are, taking money and kind together?—Yes. At the time that the Limited Enlistment Bill was agitated, there was considerable opposition to it by many military men, and very high authorities. With the view of removing that opposition, I investigated carefully what the soldier's advantages were, as compared with the wages then paid in civil life, in the agricultural districts. I then inquired whether he had generally availed himself of the option he already had of leaving the service, for there had been a regulation several years in existence, that a soldier might have his discharge after 14 or 15 years' service, if he thought proper to accept it, without a pension; or after 15 years' service, with considerable money advantages, though still without a pension; and I found that though two or three per regiment were allowed to go per year, not half that number went. The advantages of the soldier, including his pay, his beer money, the cheap rate at which he was supplied with food, his house rent, medical attendance, and clothing, were then worth about 12*s.* a week.

6510. Did that include his prospect of a pension?—Yes. And at that time, in none of the agricultural districts, except Yorkshire, was anything like that amount given for wages. Upon that explanation the opposition was removed.

6511. (*Mr. J. R. Martin.*) Does not the enormous sacrifice in money alone, through the unnecessary sacrifice of military life, go to establish the truth that the cost on account of an efficient medical establishment is hardly to be taken into account in the comparison?—If there be anything deficient in the medical establishment, I think it is impossible to place a money value on it.

6512. I was taking the money value alone, in reference to your own statement?—If you could not get as efficient a man for that price as you ought to have, the price should be increased; but there is a great question connected with that, viz., the pay of all ranks in the army. For instance, the pay of a lieutenant-colonel is the same now as in the reign of Charles the 2nd, while the pay of the surgeon and assistant-surgeon has been, I believe, increased three or four times. The great difficulty that I see in giving such a rate of pay as would secure the highest possible efficiency is, that it would place the medical man in a superior position as to pay than the officer commanding the regiment.

6513. There is a financial difficulty there, and looking only to the ascertained enormous sums which have been lost, compared with the immense saving to be effected by an efficient medical establishment, do you not consider that it is a matter deserving the highest consideration how that is to be obtained?—Most assuredly. There can be no question of it, because our establishment, which is now only 100,000, may, in the event of war, be increased to 300,000, and some of the officers whom you are training now would then require to be superior officers of that larger army, and ought to be qualified for that duty.

6514. If in 30 years, at one station in the East Indies, 150,000*l.* worth of the lives of European soldiers has been lost, how small, as compared to that

Colonel Sir
A. M. Tulloch

29 June 1857.

sum, was the salary of all the medical officers there employed, during those 30 years?—No doubt, but the difficulty as to giving a proper rate of pay to medical officers, rests mainly, I apprehend, in the relative rate of pay of the other grades.

The witness withdrew.

Dr. JOHN SUTHERLAND further examined.

Dr. John
Sutherland.

29 June 1857.

6516. (*President.*) Some time ago you were requested, along with Drs. Alexander and Mapleton, to inspect the hospitals at Haslar and Portsmouth,—will you state the result?—The situation of *Haslar Hospital* is not very good. There are close to it extensive mud beaches with vegetable matter, exposed at low water to the action of the air and sun. The hospital forms three sides of a quadrangle, surrounded by open garden ground. The quadrangle is laid out as a garden. The exterior is clean and free from nuisance, and the building is exposed to the sea breeze, but also to emanations from the mud beaches. Each line of buildings forming the three sides of the quadrangle is double, with a space of about 30 feet between the walls, so that the hospital consists of a double range of wards all round, like two letters E, one within the other. These ranges are connected by buildings at different distances, and there are large roomy staircases, with ample means of ventilation. The common wards we examined contained 14 beds, and were 59 feet long, 23 feet 7 inches broad, and 11 feet 8 inches high, with five windows opening into the external air on one side, and two windows opening into the space between the double line of wards on the opposite side. The cubic contents are about 17,327 feet, affording above 1,200 cubic feet of space for each patient. The beds are placed at 8 feet distance from centre to centre. The wards are provided with hot water apparatus for warming, and with open fire-places; the former method of warming is seldom or never used. The ventilation is effected by opening the windows, or by occasional glass louvres in the upper window sash, and generally there are four ventilating bricks opening into the outer air near the ceiling of each ward, and three small ventilating apertures communicating with the chimney. The ventilating bricks are protected by moveable covers. In wards where the windows were shut these ventilators were altogether insufficient for preserving the purity of the air. The wards felt close and the atmosphere offensive. The wards in which the ventilation appeared to be sufficient were those in which the windows were open, or the number of sick very small in proportion to the size of the ward. The water-closets are self acting, and are placed in a small apartment communicating with the ward. They were tolerably clean and free from effluvia. There are quarters for field officers consisting of two rooms; for officers who have a separate cabin on board ship, consisting of one room; engineers are accommodated five or six in a room; and midshipmen have a long room, part of which is divided by bulk-heads into separate sleeping places. The hospital was beautifully clean in every part, the floors well rubbed, the walls and ceilings brightly whitewashed, and the light abundant. The officers' quarters are carpeted and suitably furnished. The kitchens are in the basement of the building. They were in excellent condition, amply provided with boilers, and along one side was a large iron range for cooking by gas. There is no lift for taking up the diets to the wards, these are carried up stairs by the nurses. The kitchens were imperfectly ventilated. There is a separate room on the basement for baths, the accommodations in which are of an ordinary character. A large wash-house has been erected separate, and at a short distance from the main building. It appears to contain all the latest improvements, such as boiling by steam, steam washing and drying machines, and centrifugal wringers.

6515. Taking a military view of such a question alone, would it not be right to look to the good that might be effected for the soldier, leaving it to the authorities to deal with the question of economy?—The best way is to get the most efficient.

It contains a steam-engine and steam boilers for these various purposes. This establishment was undergoing repairs. The water supply is obtained from two Artesian wells, but at present it is neither very good nor abundant. It is laid on to every flat of the hospital. Female nurses are employed in all the wards, and judging from the neatness and cleanliness around the sick, they appear to be efficient in their duties. The drainage of the building is stated to be, on the whole, good, and is conducted straight to the sea. There is a lunatic asylum on one side of the hospital containing at present 126 inmates, consisting chiefly of men who have suffered from exposure to climate, malarial fevers, or who are affected with a morbid state of the digestive functions, which were stated to be among the more common causes of the mental disease. Drinking was said to be a rare cause. The mortality among the lunatics is about $11\frac{1}{2}$ per cent. per annum. There is a separate garden and exercising ground for these patients. The internal arrangements of the lunatic wards appear very good. They were perfectly clean and well ventilated. There are accommodations for officers of all ranks as well as for seamen. They are hardly ever returned to the service in the event of recovery, but are kept till death at the expense of the government. Haslar hospital appeared to have comparatively a small number of sick, and to have a very considerable amount of unoccupied accommodation. The hospital is lighted with gas.

The military hospital at Portsmouth is situated across the opening of one of the bastions, with a high rampart rising at a short distance behind it, outside of which is a glacis and broad ditch full of water having a current through it. The front of the hospital is towards a public street, between which and the front is a small gravelled court. It is 3 flats in height, the lower flat is chiefly occupied by officers, and on the upper flats there is accommodation for about 279 sick. The hospital consists of a single building, with two slightly projecting wings, and between these two wings, along the whole front of the building, there are open corridors on each flat, formed of brick arches resting on iron columns. These corridors are about 10 feet broad, they are paved with asphalt. The columns are about 10 feet high, the wards are long and narrow; they are 48 feet in length, 22 in breadth, and 11 in height, and extend from back to front of the building in their longest dimensions. They have two windows at each end, and one door opening on to a staircase extending from top to bottom of the building. Some of the wards are divided by a transverse partition into two smaller wards, having each two windows only at one end. The ventilation is provided for by two ventilating bricks, inserted in each wall front and back. The larger wards have two fire-places, and each flue has a small Arnott's ventilator. There is a double ventilating brick near the floor at each extremity of the ward, intended to supply an air trunk which passes under the flooring, and opens by a circular grating in the floor of the ward; each of the larger wards has two such gratings. In the roof, exactly over the floor gratings, is a small ventilating tube for affording egress to the foul air; it passes along the ceiling to the upper ventilating bricks. Considering the size of the wards and number of sick in each, these ventilating arrangements are so defective that they can hardly be considered as producing any beneficial effect upon the atmosphere; indeed, the open windows appeared to be mainly depended on, and even with

these, the natural ventilation was very defective, on account of the long narrow shape of the ward, the great distance (48 feet) at which the windows are placed from each other, and the large number of sick contained in each ward. The drainage was said to be efficient—it is carried down to the harbour, and the outlet is below low-water mark. The water-closets are placed in projections on each flat, they are separated from the staircases into which they open by a lobby, lighted and ventilated by a window on each side. There is a sink in the same outbuildings. These closets were not clean, and some of them were offensive, but the ventilation was sufficient to keep the effluvia from entering the wards. None of the internal walls of the wards are plastered—the walls consist only of whitewashed brick. The stairs and passages are of wood, and were by no means clean, and the wards themselves admitted of great improvement in this respect. The larger wards have 11,616 cubic feet of space. They contain 17 beds, placed 5 feet from centre to centre, and the amount of cubic feet of space for each patient is about 680 cubic feet. The smaller wards contain nine patients with the same cubic space. This hospital has been constructed on a very defective plan—the wards are too long between the windows from back to front, the means of ventilation are wholly inadequate—the cubic space for each patient is about one half of what it should be, the hospital is not clean, and, as there are no female nurses, it is destitute of that neatness and order observable at Haslar. Its local position is not good, though perhaps as much so as could be obtained in the locality. The ablution room is badly lighted, and there is no proper bath accommodation. This hospital affords in every respect a striking contrast in its sanitary condition to Haslar hospital, though there are some points in which the latter would admit of improvement. The kitchen at Portsmouth hospital is situated in a detached building, and appeared suitably provided with the means of cooking diets.

6517. What is the width of the wards at Haslar?—23 feet 7 inches between the opposite windows, and they are 59 feet long.

6518. Since you examined these hospitals you have also made an examination of a number of hospitals, civil and military, at Paris and Brussels; will you now state what are the chief structural differences between the French hospitals and those at Haslar and Portsmouth as regards the wards for the sick?—The wards in the French hospitals are placed the lengthway of the buildings, and the distance between the windows is much less than in Portsmouth hospital. In the more recently constructed French hospitals the distance between the ranges of windows across the wards is about 30 feet, and at Portsmouth it is about 48 feet. The structure of Haslar hospital resembles that of the French hospitals. The distance between the windows on opposite sides of the wards at Haslar is about 24 feet, or about one half what it is in Portsmouth military hospital. I am of opinion that, as a point of healthy construction, the windows should be placed along opposite sides, and not at opposite ends of the wards.

6519. In the hospital at Portsmouth is there a long narrow ward lighted at each end?—Yes.

6520. At Haslar the wards are lighted laterally?—Yes.

6521. What comparison would you make between the French and British hospitals as regards light and the means for natural ventilation?—The usual number of windows in French hospitals is one window to two beds, and two beds are placed between every two windows. In the Portsmouth hospital there are four windows for 17 sick, and there are eight or nine beds between each two windows. In Haslar hospital there are seven windows for 14 sick, and the sick are arranged between the windows in a somewhat similar manner to the arrangement in the French hospitals. The number of windows to sick at Haslar and in the French hospitals is double what it is at Portsmouth, and the windows are also much larger, and better placed for light, ventilation, and reading. There should never be less than one window to two sick.

6522. How do these different arrangements of windows affect the ventilation of these hospitals?—The natural means of ventilation arising from the larger number and better arrangement of windows are amply sufficient in the French military hospitals and at Haslar, while in the Portsmouth military hospital they are very defective.

6523. What is the comparative height of the wards?—The newer wards in Val de Grâce are about three feet higher than they are at Haslar, and nearly four feet higher than at Portsmouth hospital, the wards of which are lower than any I am acquainted with as having been specially built for hospital purposes. The better wards at Brussels are higher than those at Val de Grâce. At La Riboisière the wards are 6½ feet higher than at Portsmouth. The wards at Portsmouth and Haslar are much too low, but at Haslar the defect is to a certain extent remedied by the greater distance between the beds.

6524. What comparison would you make as to cleanliness?—Haslar hospital is perfectly clean for all sanitary purposes, and will bear a comparison with any French hospital in that respect; but the French military hospital of Val de Grâce, and the civil hospitals generally, are much cleaner than Portsmouth hospital was when I saw it.

6525. How would you compare the arrangements as to windows and beds for lighting the wards?—The arrangements of windows and beds for light are very much better in the French hospitals than in the Portsmouth hospital, and are on the same plan as at Haslar.

6526. What difference is there in the cubic space allowed for the sick?—The beds are much wider apart in the foreign hospitals, and the cubic space in the military hospitals at Paris, and in the best wards at Brussels, is nearly three times the amount per bed that it is at Portsmouth hospital. In the generality of civil hospitals in Paris and Brussels the cubic space is about double what it is at Portsmouth, and the cubic space allowed at Haslar is not much less than double also.

6527. What are the comparative merits of the methods of supplying water to hospitals?—In the French hospitals the water is equal in quality to ours. The supply is unlimited, and at Val de Grâce there are water vessels with taps in the wards. The defect is that the water is not laid on constantly on every flat, and that it is not supplied to water-closets as at Portsmouth and Haslar. At Haslar they have Artesian wells, and there is a tank to supply Portsmouth hospital. In London and in many towns in England the water supply for hospitals is still defective, for it is received and stored in cisterns instead of being always drawn from the supply tap. In every hospital where the water is not laid on over the whole building, and drawn direct from the mains at all times, instead of from tanks or cisterns, the water supply is defective for sanitary purposes. I do not consider that there is any very decided advantage in this respect at present on either side of the channel, except as regards water-closets, and the better supply of those towns in England and Scotland where improved distributing arrangements have been introduced lately. We have towns and hospitals in those towns that receive water direct from the mains.

6528. What is the comparison as regards water-closets?—The military hospital at Portsmouth and the hospital at Haslar have a very decided advantage over all the hospitals, civil and military, in Paris and Brussels in this important particular. In the foreign hospitals there are only open latrines, all more or less offensive, and with few exceptions arising from position and free ventilation, tainting more or less the air of the wards and staircases. Although the water-closet arrangements in the two British hospitals are not all that might be desired, they are very greatly superior indeed to the latrine arrangements in the foreign hospitals.

6529. What comparison do you draw as regards lavatories and baths?—The lavatories at Haslar and Portsmouth admit of much improvement; but still the principle of a separate lavatory is admitted, while in

*Dr. John
Sutherland.*

29 June 1857.

*Dr. John
Sutherland.*
29 June 1857.

the French hospitals the sick as a rule wash in the wards. Both arrangements, lavatories and wash-hand basins for the wards, are, however, requisite. With regard to baths, the arrangements at Haslar are of a very ordinary character. Those at Portsmouth hospital are very defective. In Val de Grâce there is a regular bath establishment—good of its kind, but not so perfect for hospital purposes by any means as the establishment of La Ribosière.

6530. Did you make any observations as to the apparent effect of the presence of female nurses?—In all the foreign hospitals we visited, the impression produced on my own mind was, that independent altogether of the effect likely to be produced by female nursing on the sick, the mere presence of a sister in the ward had a most beneficial effect both on the sick themselves and on the neatness of the wards, as well as on the discipline. Nothing could exceed the quiet and order of the wards. The same observations were made by all the medical and other officers connected with the civil and military hospitals abroad, with whom I conversed on the subject. I was struck also with the same fact as regards Haslar.

6531. (*Mr. J. R. Martin.*) It would appear, therefore, that independently of the actual service performed by these nurses, their presence has had a humanizing effect upon the patients?—Most certainly. I had an interview last week with Dr. Zdekauer, who came here from St. Petersburg to examine into our hospitals, and he made a similar remark as to the effect of female nursing in their hospitals.

6532. (*President.*) Have you any comparison to make as to the bedding?—Except in the use of bed curtains in certain civil hospitals abroad (of which I disapprove), and bed curtains are not used in military hospitals, the bedsteads appeared of better construction than they are either at Haslar or Portsmouth. They have more conveniences, such as shelves. The bedding in the foreign military hospitals appeared to be on the whole softer, warmer, and better. It was, in fact, excellent and very clean.

6533. You have heard the statements made in evidence about the Chatham hospital; could any military hospital you saw abroad be described in similar terms?—I have not seen Chatham hospital, but so far as the impression goes as to its sanitary condition produced on my mind by what I have heard in the room, I should say that no hospital we saw abroad could in any way be so described.

6534. Putting together the sanitary advantages and disadvantages of the Paris and Brussels military hospitals, how would you compare their sanitary state as a whole with that of the British naval and military hospitals?—Haslar hospital, with a little improvement in matters of detail, could easily be made to surpass for all practical purposes the military hospitals at Paris and in Belgium; but Portsmouth hospital is very far behind them, as is also Chatham hospital.

6535. Is there any reason why the British military hospitals should not equal those of France and Belgium?—None whatever; we ought to equal them in hospital construction, and with our habits we ought to surpass them in all our hospital arrangements.

6536. Have you formed any opinion as to the best system of ventilating hospitals?—Yes; natural ventilation by doors, windows, and fire-places, aided, if need be, by ventilating shafts from the ceiling of each ward. All hospitals should be so constructed, both for warming and ventilation, as to render mechanical ventilation unnecessary. The necessity for mechanical ventilation is a proof of defective hospital construction or of scarcity of fuel. This remark, however, only applies to hospitals.

6537. How then does it happen that, with a system of hospital construction of which you approve abroad, artificial ventilation is nevertheless resorted to?—In those exceptional cases to which you refer artificial ventilation is only used in cold weather, mainly for the purpose of economically warming the air supplied to the wards, for in warm weather, when warming is not required, the ventilating machinery is not used.

6538. And the windows are open?—Yes.

6539. Are there any circumstances under which artificial ventilation could be advantageously used in hospitals?—Yes; where the hospital construction is defective, and the natural means of ventilation consequently inadequate, or where great economy in fuel is requisite; for with artificial ventilation you may warm an entire hospital with the same single fire that heats the baths, washes and dries the linen, and supplies steam power for ventilating, and for all other purposes. But warming by radiant heat from open fire-places is much better than using heated air.

6540. (*Mr. T. Alexander.*) At La Ribosière on the male side the ward windows were all shut?—They were partly shut when you were there, but the ventilation there was very defective. It was better on the female side where they were open.

6541. (*Mr. J. R. Martin.*) In the case of a barrack or a hospital, it would appear from much that has come before the Commissioners that it is not to the actual size of the room or the ward that we may refer the defective ventilation and the unhealthiness of the inmates, but to the fact that where the apartments are large there, owing to faults of construction, ventilation is everywhere most defective, whereas in small detached houses or huts we are sure to find more windows and doors proportionately?—Yes; that is a very important point. It involves a great principle, namely: the extent of the window surface that you should apportion to a given cubic space; in huts generally you will find the amount of window space much greater in proportion to the cubic contents than in rooms.

6542. Does not it follow from what you have just stated that where the large rooms of barracks and the large wards of hospitals are objected to, the question of the relative modes of ventilation in those large rooms, and in the huts of which we have spoken, has not been sufficiently taken into account?—I do not think that that relation has been sufficiently understood, because I should say that up to this time observations regarding it have been more the result of accident than of design.

6543. (*Dr. A. Smith.*) Do you think that it would be possible to ventilate efficiently, by any means which could be employed, a large building in the situation of the Portsmouth military hospital?—I am of opinion that it would be very difficult, with the construction.

6544. The bastions?—Yes; the local position is unquestionably defective; there are high bastions behind the hospital which interfere with the natural ventilation.

6545. (*Mr. J. R. Martin.*) Would not artificial ventilation apply in such cases as you have described?—Not in a case like that; when we were down, the windows were open, and still the ventilation in the ward was not sufficient.

6546. Machine ventilation?—In a case like that, machine ventilation might come into beneficial operation.

6547. (*Dr. A. Smith.*) Are you aware that seven sites were pointed out, and that that was the only site that furnished anything like a position where one could possibly think of putting a hospital?—The only observation that I can make upon that is, that sites for hospitals must be much rarer than I had the least conception of.

6548. (*Mr. J. R. Martin.*) Was the question of purchasing a site, already occupied by houses, taken into consideration?—The object, I think, was to have the hospital site within the lines; but Portsmouth itself is in a very bad sanitary state altogether. It is one of the worst sanitary towns in Great Britain. It has refused to have the Public Health Act, or any sanitary measures applied to it.

6549. (*Dr. A. Smith.*) Considering that that was the only site that could be obtained, the only site that the government could give, do you conceive it possible to have raised a building, possessing all the requirements, as to the wards, and other circum-

*Dr. John
Sutherland.*

29 June 1857.

stances necessary for the proper ventilation of the hospital, for cleanliness, and for the number of sick, which it was estimated would generally be 340 men?—I think it would have been possible to have constructed a hospital with those requirements upon that site, but still the site is not a good one. As a matter of construction, it would have been perfectly possible to have erected a hospital there, with sufficient sanitary appliances, so far as the buildings are concerned.

6550. (*President.*) You have heard the evidence given on the subject of medical education, and you have also inquired into the system at the Val de Grâce; will you state to the Commission your opinion upon the two systems, with special reference as to the question of military hygiene?—Hygiene is not taught systematically in any medical school in Great Britain. There are professorships in several foreign schools, but none in this country. Subjects included under the general head “hygiene” are discussed by lecturers on other departments, such, for instance, as *materia medica*, and dietetics, medicine, &c.; but there is no systematic course, and no practical training, such as is aimed at in the instructions given in the “*Ecole Impériale d'Application*,” at Val de Grâce. With us at present, practical sanitary knowledge can only be acquired by a man who devotes himself to it for years, while in the French service provision is made for teaching it. The French method is therefore very greatly superior to ours. In the practical application of knowledge so acquired the French Government has just issued this document. It is an instruction for conducting army medical inspections, issued just before we were in Paris. The medical inspectors of the French army, of whom there are seven, are charged, among other duties, with the sanitary supervision of the districts allotted to them. Along with the commanding officer, the barrack officer, and the medical officer, the inspector is required to make a sanitary examination of the position and vicinity of military buildings, the cubic capacity of rooms, the number and size of the windows and doors, the ventilation, and the state of cleanliness of all parts of the barrack. He collects any observations that may have been made on the salubrity of different localities, and if necessary, gives his advice on them to the Minister at-War. He inspects the kitchens, to see that their ventilation, flooring, drainage, the cleansing of utensils, &c., are sufficient for health; also the composition and preparation of the mess, and gives such advice as may appear necessary in all points relating to their hygiene. He examines the condition of the water used by the troops, and can direct its analysis. He visits the canteens to inspect the quality of food and drink sold there, and insists on due surveillance being kept up over them. He has also to inspect the sanitary state of military prisons. He insists, when necessary, on personal cleanliness, and the use of river and sea baths. He inquires into the kind of gymnastics in use, the prophylactic measures against syphilis, and the sanitary precautions adopted in regard to recruits. He examines and verifies the vaccination of the troops. He inspects the sanitary condition of regimental infirmaries and of convalescent wards in hospitals. One special part of his duty in visiting hospitals, is to call the attention of the medical officers to those scientific and practical points of hygiene which specially influence the health of soldiers, such as the knowledge of climate and medical topography, and of the special sanitary conditions and diseases prevalent in different localities. He enforces on all the necessity of continually studying the life of the soldier in the relations in peace, and war in which he may be placed; and he insists on the duty of studying the various causes which can affect the health of the soldier, and of indicating to the competent authorities the means of destroying or diminishing their activity, and that this duty is at all times necessary, and is one which may render the greatest public services. He is required also to call the attention of the medical officers to the utility of studying and discussing together the causes, nature, and treat-

ment of prevailing diseases or epidemics, and the sanitary necessities and improvements of which the service seems capable with respect to them. After the inspectors have completed their mission, they are required to meet for the purpose of submitting to the Minister-at-War a report presenting those general conditions applicable to the hygiene of the troops to the medical service and hospital establishments, and indicating improvements the adoption of which may appear to be advantageous. While in Paris, I made the inquiry of one of the inspectors how this process answered in case of an epidemic appearing in a corps or garrison, and I was told, that in such a case the facts would be notified day by day to the conseil de santé, at Paris, who would, day by day, state their views to the Minister-at-War.

6551. Is it your opinion, from your own experience, that such a course of education as you have described is really necessary for the army medical officer?—Most certainly—we find as a matter of experience, that in civil life few medical men have as yet obtained a practical acquaintance with the subject, chiefly, I believe, from defects in the system of medical education, which has hitherto been directed rather to giving prominence to the cure than to the prevention of disease. It appears to me that the practical knowledge of prevention ought to be at least as complete as the practical knowledge of cure is in every department of the medical profession. And there is greater need for this in the army than even in civil life. The army medical officer should be a true officer of health, trained in dealing with all subjects affecting the health of the soldier.

6552. (*Mr. J. R. Martin.*) Do you consider that an officer who enters upon his duties in the army, deficient in all those instructions which you have described, has to acquire his knowledge of hygienic science in future life at the absolute expense of the soldiers?—He is in exactly the same position as a medical man in civil life is, as he is taken from the same class. Medical officers in civil life require to gain sanitary experience. I had to get my experience just as other people have; but what I desiderate both in civil life and in the army is, that other people should not have the same difficulty in acquiring experience. I think it might be all, or at least a large part of it, prevented by suitable training and suitable education beforehand.

6553. (*President.*) Should the army medical officer know all the articles of food, with their relative value, and how to detect deficiencies or adulterations?—Certainly.

6554. And the effects of particular articles of diet on healthy men in different climates, and under different conditions as to labour, exposure, and fatigue?—Certainly.

6555. And diseased constitutional states likely to arise from the continued use of the same articles of diet?—Certainly.

6556. Under these circumstances what changes are required—the means of testing the purity of water and other drinks, and also the best methods of purifying water for troops?—Most certainly.

6557. The characters and qualities of drinks which the soldier is likely to meet with in different countries?—Yes.

6558. The question of clothing and accoutrements, as regards materials, qualities, adaptation to climates, the science of medical topography, climate, waters, and local diseases of all countries where war is likely to be carried on?—Yes.

6559. And physical geography, conditions as to soils, subsoils, geological structure, natural drainage, marshes, lakes, banks of rivers, and the conditions connected with these likely to affect the health of the troops?—Yes.

6560. How to detect in the sick indications of the presence of organic matter in the air or water of a district, by its effect in modifying disease?—Certainly.

6561. The special effects of particular kinds of shelter in tents, huts, bivouacs, of damp soils as

*Dr. John
Sutherland.*

29 June 1857.

influencing the air in these, and the results to the health of troops?—Yes.

6562. The effects of crowding and defective ventilation, and the best means of remedy—the best methods of improving the surface and subsoil drainage, and the external characters of military positions likely to affect the health of troops, with the means of remedying these, if remediable?—I think that is highly necessary.

6563. The local conditions affecting the health of towns, villages, and buildings to be occupied for military purposes, with a view of pointing out the sanitary defects, and the manner of remedying them?—Certainly, these very duties are now required in this country from officers of health whom Mr. Martin was one great means of getting appointed. We find in regard to towns that these officers are in the highest degree useful to the public service; and I know no reason why a town to be occupied by a part of an army should be left without the same sort of intelligent care that is bestowed upon towns in England.

6564. (*Mr. J. R. Martin.*) A town being regarded as a permanent camp?—Nothing more.

6565. (*President.*) You would include in the education of the army medical officer all the sanitary questions connected with permanent barracks, hospitals, garrisons, &c., including drainage, water supply, cleansing, and the best means of rendering all military buildings healthy, as regards these things and ventilation?—Certainly the whole.

6566. In short, in your opinion the medical officer should be so thoroughly conversant with all these subjects that the military officer could apply to him for advice and assistance with perfect confidence?—Certainly; he should be the sanitary adviser of the commanding officer, as well as his medical adviser. I hold it as a great mistake to consider that a military medical officer should be solely an officer to treat disease. His duties are far more important than that. He is brought in contact with conditions affecting health which he knows far better, or ought to know far better, than his commanding officer; and since the preservation of the health of the army is in fact the preservation of the efficiency of the army, I consider that it is a far higher duty in a medical officer to prevent disease than to treat it.

6567. (*Mr. J. R. Martin.*) You are aware that, more than half a century ago, Dr. Robert Jackson, reviewing the health and history of the British army, declared that the enormous mortality which then existed would go on until medical officers should have that position in the council of command which was due to science? Yes; I have read that in Dr. Jackson's book.

6568. (*President.*) Would you extend the knowledge of the medical officer to military gymnastics, exercises, and duties, and their effect upon health?—Yes.

6569. Should he be acquainted with the whole subject of camp diseases, and epidemics, their nature, origin, causes, management, and prevention?—It is in the highest degree necessary.

6570. Do you consider that for sanitary purposes chemical and microscopic analysis would be advantageous?—Yes.

6571. Should the medical officer make himself acquainted with the subject of cooking, especially as regards the preparation of hospital diets and comforts; and also with the effects of different kinds of baths in the hygienic treatment of disease?—Certainly.

6572. Would it in your opinion be practicable to instruct the army medical officer in these various subjects?—Beyond all question. There are as able regimental medical officers in the British army now as can be found anywhere, but what I desiderate is, that those men should have the means of increasing their knowledge on sanitary subjects, and of making that knowledge practically useful.

6573. (*Mr. J. R. Martin.*) You are further of opinion that a medical officer should be intimately acquainted with the order of march of the troops, so as to be able to assist his commanding officer with advice as to the mode of making out the marches, in different climates

and countries, with the least possible injury to the men's health?—I think that that would be highly desirable.

6574. (*President.*) Would the benefits to be derived by the service from the course of education compensate for the cost to the country?—Yes, upon the well-known principle that of all things the most expensive is to transgress the laws of nature; and hygiene consists in nothing more than in studying the laws of nature with reference to health, and applying them.

6575. (*Mr. J. R. Martin.*) Has it not been demonstrated in civil life that the expense of all sanitary structural improvements is repaid over and over again even within the short life of a man?—Yes.

6576. (*President.*) Suppose the army medical officers were educated in sanitary science, how would it be possible to make their knowledge available for the good of the service?—If a commanding officer knew that his medical officer was not only attached to the regiment to treat the sick, but to prevent disease, and if the commanding officer knew that the medical officer was specially trained for this purpose, I cannot doubt that the commanding officer would be guided by the advice of his sanitary officer so far as military reasons would admit. The military element in an army must be supreme and responsible; and hence the greater necessity for affording to the military element the very best means of information on all subjects affecting the physical efficiency for the force. I would give the sanitary officer the power of representing defects or giving advice, with reasons always in writing; and copies of all such recommendations, with the replies and steps taken, should be sent to the war department.

6577. (*Mr. J. R. Martin.*) But inasmuch as it is not possible to educate the whole body of men alike in sanitary science, do not you think that a high functionary should be attached to the army, with a few subordinates, for the sanitary service of the army in time of peace as well as in war?—My impression is, that if such a reform in education as I have mentioned were carried out, the medical officers might be very well used for this work, provided you had the sanitary element thoroughly introduced; then you could very easily work it through your ordinary inspectors. The only question would be whether some intermediate course should not be taken till such a change be brought about, and I think it could be easily done.

6578. (*Mr. T. Alexander.*) Do you not think that there are medical officers now in the army thoroughly conversant with all subjects of hygiene?—I found in the army, as you would naturally expect, a considerable difference in the amount of knowledge. There were some men who understood the subject or the great leading features of it, there were others who knew some of them, there were some who did not know them, and there were some who underrated them. I speak generally, for I had no opportunity of going into the subject minutely. I will give the Commissioners an illustration in point. One day we were inspecting hospitals, one of which was well ventilated, the earth was cut away from its sides, it was very clean and properly drained, and it was paved outside; we sent for the medical officer, and told him that we highly approved of what he had done, and that we were glad to see that he had got his hospital into such a good condition. Next to that there was another hospital, where the ventilation was defective; the earth was heaped against the walls, and there was no drainage. In that case also we sent for the medical officer, and he argued the matter with us, as to the necessity of carrying out those changes which his brother officer had already done within four yards of him. What we desire is, that the knowledge displayed by one of these officers should be extended over the whole army.

6579. (*Mr. J. R. Martin.*) Have you not found in the army, among the army medical officers, as in civil life, that the objectors to the progress of sanitary science are either persons who are old and who have

ceased to improve their knowledge, or else young men who have been idle and who have never acquired any real knowledge on the subject?—I think you have very accurately described the classes of objectors.

6580. Furthermore, do you not think that as a matter of science the time has arrived when the cure of disease and the prevention of disease ought to be separated in the army as in civil life?—I concur entirely in the general principle of such a separation, but I have a feeling that the army medical men are competent to do the work. I see certain objections to having separate officers. Suppose you send out a detachment with an assistant-surgeon, you could not send a sanitary officer with the detachment, and in a case like that your assistant-surgeon or whoever is in charge of it should be so conversant with the matter that he could do everything necessary; but at the same time you should have inspecting districts including detachments, to which the inspecting officer might go and see how the other officers were doing their duty.

6581. If you had a high functionary in the sanitary department such as is contemplated, would not the knowledge now possessed by the medical officers in the army be rather enhanced through his agency?—No doubt it would; I think you might very well so arrange the matter that you might have a special functionary, such as you mention. At the same time the army medical officers should be left to be executive officers. It would not be safe to go in amongst them with a new class of officers. I feel that they should do their own sanitary work upon this great general principle, that not only in the army but in towns the sanitary officer should be always at hand.

6582. But the functionary which I contemplate is an army medical officer of high distinction?—If you contemplate such an arrangement as that, it would merely be adding to the army medical department some medical officer especially conversant with sanitary measures, as the head of a sanitary department, to manage the whole matter.

6583. (*Mr. T. Alexander.*) Do you not think that you could now pick out men in the medical department of the army, who could deal with all sanitary matters as well as by bringing in civilians?—There are some men in the army that you might send to do any sanitary work; but what I desiderate is, that that number of men should be increased as much as possible.

6584. (*President.*) So that every army medical officer should be competent to give advice on sanitary points, and carry out his recommendations?—Yes.

6585. (*Mr. T. Alexander.*) So that, in fact, your medical officer should be your sanitary officer?—Yes; and a far higher public functionary he would be than the man who merely treats diseases.

6586. (*Dr. A. Smith.*) Should there be such a regulation in the service that the military authorities should attend to the recommendations of the medical officers as to sanitary matters?—You must have some head, some court of appeal. I have seen sufficient to know that the military element must be supreme, and must be held responsible; but the medical officer should be so thoroughly *au fait* at the whole question, that the commanding officer should be able to know that he could give competent advice; and I think that the commanding officer in that case would do at home what I have been told he does in India, namely, listen to the advice of his sanitary medical officer. If the medical officer were made a sanitary officer, I think there would be little difficulty in his recommendations being attended to. He should have the power of making recommendations; and there should be a regulation that those recommendations should be considered, but I would not make it a condition that they

should be acted upon. That must be left to the judgment of the commanding officer.

6587. (*Mr. J. R. Martin.*) Are you aware that in the East Indies and almost in any other country the constant neglect of the advice of the medical officers has been complained of?—It would be a great reform as regards that, if there were some means of supporting an intelligent medical officer in the discharge of his duty; and that might be done by requiring that copies of all his recommendations, with the reasons for them, the reply of the commanding officer, and the steps taken should be transmitted, as I have stated, to the War Department; and by having a competent head of the sanitary department at home to advise on all such matters, and to support the medical officers in the discharge of their duty in this important matter.

6588. (*Dr. A. Smith.*) It would be necessary for the government to be more liberal in the expenditure of money as to sanitary matters, would it not?—Beyond all question it is the worst economy in the world to save money when the object of spending it is to preserve health.

6589. Do you agree with Dr. Alison of Edinburgh—who makes this remark, that, next to the discoveries which have within the half century been made in physiology, stand those important observations which have been made in knowledge of the external causes of disease—this gentleman states that medical officers of the army took the lead in this, and that they have up to this present moment continued to do so?—Yes; I must take this opportunity of stating that we owe the beginnings and first lights and some of the greatest lights that we ever obtained to medical officers of the British army, and also to medical officers of the British navy. The army has furnished men of the highest intelligence, such men as Sir John Pringle and men of the same stamp; and it is to a very considerable extent owing to the labour of these men, that the sanitary cause has taken root and flourished as it has in civil life. But it should not be forgotten that with unfettered, practical sound sense, the people of this country have of late years made great advances in the practical application of sanitary science; while the army, which has been fettered by its position, has not made the same advances. That has been a complaint against the army. It is necessary that such improvements should be introduced as will enable the army to go along with the civilians, so that we may not be only in a civil but in a military point of view the most healthy people upon the face of the earth.

6590. (*Mr. J. R. Martin.*) You are aware that the sanitary measures established within a few years in England and Wales are but the carrying out of measures long known to the surgeons of our fleets and armies?—Certainly. At the present time, we have about 2,000 sanitary inspectors and officers of health at work in England, in carrying out measures of this kind; and we want the same sort of inspection done by the medical officers themselves in the army, so that every station, every barrack, every garrison, shall be kept in the same state that we contemplate our towns eventually will be kept in.

6591. (*Mr. T. Alexander.*) You would have a special report made upon the sanitary state of all barracks and hospitals once or twice a year, and which would be laid before the Minister for War?—More than that; I think that the occurrence of certain diseases, especially zymotic diseases, among soldiers, beyond the due proportion, should be an instant reason for making a sanitary report; and such changes should be introduced, in the executive departments, as will secure that these reports shall yield practical results to the service.

*Dr. John
Sutherland.*

29 June 1857.

Adjourned to Wednesday next.

Wednesday, 1st July 1857.

PRESENT:

The Right Hon. SIDNEY HERBERT, M.P.
Col. Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

SAMUEL GASKELL, Esq., examined.

Samuel Gaskell,
Esq.

1 July 1857.

6592. (*President.*) You are a commissioner in lunacy?—Yes.

6593. You visited and reported, I think, formerly upon the military lunatic hospital at Yarmouth?—I visited it several times.

6594. Can you give the Commissioners generally a statement of the condition in which you found it?—Its condition was very much improved on the occasion of my last visit.

6595. Was that at the time it was under the care of Dr. Dartnell?—Yes; for a considerable time it was under the charge of several medical officers, each staying there only a short period.

6596. Being removed by roster?—By some rule of the service. We thought that a very objectionable plan, and we made a recommendation to the War Office that they should appoint a fixed medical officer; in 1852 we made that recommendation, and Dr. Dartnell was subsequently appointed.

6597. Will you state the occasion of your first visit?—I do not remember.

6598. Did you examine it first at the request of the Secretary-at-War?—I think not. It had been visited by some of the Commissioners before I was appointed, and I think it was the custom to make a visitation when that particular circuit was visited by two Commissioners. I remember my first visit was when I first went on that circuit, which would be in the spring of 1849.

6599. You state that it was very much improved by 1852?—After 1852 it improved very much. I have noted down from the reports which I drew up the different improvements, and I will state them. The system of restraint was abolished, the wire-work was removed from the windows; they had been protected before by wire-work, which made it look very offensive; the furniture was very much improved, the furniture of the officers was greatly improved; the mode of serving their meals, which had been very defective before, was very much better, and they had been provided with a quantity of books, and a number of very suitable maps were hung upon the walls, with appropriate pictures also. Then their amount of exercise was greatly extended; they were taken more frequently beyond the bounds of the small courts, a number of amusements and recreations were provided for them; workshops had been opened, and they had begun to enter upon a variety of occupations.

6600. Had they gardens?—Not much. We recommended an increased quantity of land; it is a very poor sandy land.

6601. It is very open, is it not?—Yes, very open to the sea to the east; they have very good views from the airing courts. The dress was greatly improved. They were formerly dressed according to a rule of the service in a kind of a blue hospital dress, and that was at our recommendation disused, and they were dressed in more suitable clothing. Their diet also was more varied and improved.

6602. How were they dieted before—like the soldiers in barracks with boiled meat?—I do not

remember exactly; I presume it was something of that kind.

6603. You do not recollect the way in which they were fed?—I think there was a want of variety, and there was also a want of such things as knives and forks, and suitable means of serving the dinner.

6604. What is your impression of the hospital as it was left?—That it was very much improved.

6605. Was it capable of further improvement?—Yes.

6606. In what respects?—I think that the recommendations had not been fully carried out, and the quantity of land was defective.

6607. Is there the means of getting additional land there?—I believe there is, though it is of a very poor sandy quality.

6608. That would, of course, make it more easy to get?—It is very easily got, I believe; it belongs, I think, to the corporation.

6609. (*Dr. A. Smith.*) In the event of its being possible to re-establish that hospital at Yarmouth, do you consider the situation eligible for a lunatic asylum?—I think it is not bad, though it is not very eligible in some respects. Its exposure to the east is, I think, objectionable.

6610. (*President.*) As wanting sun?—It is rather cold. I think that the sun's rays come freely upon it, for there is no other building to obstruct them.

6611. The sun's rays do not come in the front entirely?—No.

6612. (*Dr. A. Smith.*) Do you think it a cheerful position for men in that state to be in?—Yes.

6613. Only having the sea, to look at?—There is always a great deal passing on the sea, and in the roads of Yarmouth a great deal of shipping.

6614. (*Mr. J. R. Martin.*) There is a variety of objects?—Yes.

6615. (*President.*) That is an advantage rather to the sailor than the soldier?—Yes.

6616. (*Dr. A. Smith.*) The country round is not that kind of country that a man with a little degree of mind remaining would like?—I do not consider it very eligible.

6617. (*President.*) It is a bleak, desolate, open, sandy beach, is it not?—Yes, but the port is near, and it is such a place as is resorted to by persons going to the sea side for the summer months.

6618. (*President.*) There is great difficulty in continually transferring men away from the place where they arrive to Yarmouth, is there not?—I think that is a very important consideration; it is very important that hospitals should be placed conveniently for the approach of invalids.

6619. As near to the port of disembarkation as you can?—Yes.

6620. Therefore, if you contemplated the re-establishment of a permanent lunatic asylum, such as we have at Yarmouth, you would recommend it to be near to Netley, where the invalids are disembarked?—I should think it preferable to be near.

6621. Have you seen the lunatic hospital, not the new one, but the old casemates at Fort Pitt?—Yes.

6622. That may be, I suppose, disposed of by saying that it is as bad as can be for a lunatic asylum?—Abominably bad; it is difficult to conceive of any building that could be worse.

6623. Have you seen the small new hospital where the men are received and are under observation?—It was not open when I was there, but I have seen it.

6624. What do you wish to state upon the subject of that building?—I thought that it was defective in ventilation.

6625. You are satisfied with the wards and the general construction, with the exception of the defective ventilation?—Yes; I was accompanied by Mr. Campbell, and this is our report:—"The building is detached and two stories in height, and is calculated to accommodate between 40 and 50 patients, with the proper officer and attendants. The rooms are of good size, but the means of ventilation are in our opinion insufficient. The windows do not open sufficiently, and the only means of ventilating the galleries is by opening the windows of the water-closets, through which the air must pass before reaching the interior. The building is detached from other parts of the fort, and is situated so as to command uninterrupted views of the river. A portion of ground has also been appropriated for the use of the patients. The premises are still unoccupied, but we learn that the patients will shortly be removed thither from the casemates which they at present occupy. These wards are in the same state as on the occasion of the Commissioners' last visit. The water-closets and dust-holes are in an extremely offensive condition."

Those wards have continued to be occupied for about three years after our first report upon those casemates.

6626. You have seen Haslar, have you not?—Yes.

6627. That is as efficient as any lunatic asylum can be, is it not?—It is a very superior asylum. Of course, from its original construction, there are some defects, which it has been difficult to surmount.

6628. Did you know it before Dr. Anderson was appointed to it?—No, I did not.

6629. You are aware that previously to his appointment it was in a very bad state?—I have heard so.

6630. Do you know the asylum at Coton Hill?—Yes.

6631. Is that a place where the government would have proper security for the good treatment of the officers sent there?—Yes.

6632. Do you agree with Dr. Connolly's opinion, that so far as officers were concerned he thought that they would do better in an asylum where there was a greater mixture of classes, and where all their old associations would be broken through, than in a purely military asylum?—I think, so far as regards association, they would be better in a mixed asylum, such as that at Coton Hill; but I think there is something to be said in favour of their being kept connected with the soldier in a military asylum, and keeping up a kind of surveillance of the men—keeping up their old habits.

6633. You refer to the officers?—Yes, if they could in a military asylum be induced to undertake some duty. On drill, for instance.—I think it would be useful to them.

6634. The distinction which Dr. Conolly draws is this, that with an uneducated man there is no necessity for breaking through the associations of past life, but the reverse; but that with an educated man it is an advantage; should you be inclined to agree with that opinion?—I am rather inclined to think that the associations of past life, during a state of insanity, are useful.

6635. But the advantage to the private of maintaining the discipline to which he has been accustomed, and which is a part of his existence, is much greater, surely, than with the officer, with whom it is only an adjunct to his existence, and does not form one of the conditions of his life?—Still, occasionally

bringing into operation the exercise of command by an officer over the men, whilst in a state of insanity, must, I think, be advantageous to him, and it must also be advantageous to the men to be submitted to that command occasionally.

6636. It would be naturally advantageous to the men, and be a great means of treating them, to maintain habits of discipline, on which to ground their treatment; but, is it not one thing to ask the men to submit to discipline in a state of lunacy, and another thing to put power into the hand of another to command?—All the effort made by the officer would be the effort of self-control over himself; at the same time, he would put himself in such a position as to command his men, I should imagine.

6637. Would he have the same authority over them that a sane person would have?—No.

6638. (*Mr. J. R. Martin.*) You mean that it should be called into occasional exercise?—Yes; that he should be called into the occasional exercise of his former habits.

6639. (*President.*) Would the men submit to him, knowing that he was a lunatic, as they would to the command of a sane person?—Probably not.

6640. (*Sir T. Phillips.*) For what reasons would you suggest that an officer should be placed in that position?—I think that the occasional exercise of the function of his former position would be useful to him.

6641. That is, as treatment to himself?—Yes, in his own case. I confine my remarks entirely to the officer.

6642. (*Mr. J. R. Martin.*) You are aware that in civil life one of the elementary measures of cure in cases of insanity is to sever the patient from all his accustomed associations and circumstances, and that is found to be an advantage?—That is one of the first steps in the treatment, but still it is very desirable to recal the associations which have been connected with the state of sanity.

6643. (*President.*) At Haslar I apprehend there is a great advantage in the treatment of seamen in having the hospital situated on the sea, commanding the roadstead of Spithead, and enabling the men to be sent out in boats fishing?—Yes; there the principle to which I am alluding is, to some extent carried out; the men perform their duties in the same way they did previously.

6644. (*Mr. J. R. Martin.*) It is found to be successful because there you have to deal with men of few and simple ideas, and devoid of education; is not that the reason of the difference between the officer and the soldier, or the seaman?—But they are taken out in this boat, as I understand, in the same way that they were in an ordinary boat when they were in the navy; and my meaning is, that the bringing of them back to that state which they had been accustomed to before the attack of insanity is useful.

6645. (*Sir T. Phillips.*) Is that so with regard to naval officers as well as sailors?—I am not fully sure of that fact, but I should imagine it to be so.

6646. (*Sir H. K. Storrs.*) You mean the revival of early associations?—Yes.

6647. (*President.*) The sailor has many very peculiar habits, and when he is in perfect health he is not much on shore, therefore the peculiarities of Haslar apply to him rather than to any other class of persons; and there are specialties in the sailor which are treated properly at Haslar, but which do not exist in any other class of men?—As far as regards their habits at sea it is so, and their liking for the sea.

6648. Do you think that you can argue from the value of Haslar to the seaman, that it is equally necessary that a government establishment should be created for the lunatic soldier?—Not perhaps equally. Still I think you may form some argument upon it.

6649. You know the establishment at Bow, do you not?—Yes.

6650. Do you think that it is safe to send the men there, taking into account their treatment and comfort?—It is certainly safe, they are fully protected there, but they have not the advantages there which

Samuel Gaskell,
Esq.

1 July 1857.

Samuel Gaskell,
Esq.

1 July 1857.

they had at Yarmouth. They have not the same amount of exercise.

6651. Is the space more confined?—Yes, the asylum is situated in the suburbs of London, and consequently the patients cannot get so freely out.

6652. So far as the attention paid to them, the humanity with which they are treated, and the general curative processes are concerned, are they as well off as they would be at Yarmouth?—I do not think they are. They are as well off as the imperfect accommodation will admit of.

6653. In the county asylums to which the great mass of our soldiers go, when they are sent home to their parishes, I apprehend they are as well treated as they can be?—Yes, they are.

6654. Do you know anything of the manner in which the lunatics of that class are treated in Ireland?—I do not.

6655. Nor in Scotland?—Yes.

6656. What becomes of them in Scotland—is the soldier sent home to his friends and treated as a civilian would be in that class of life?—I only know of three instances of soldiers in Scotland.

6657. The case of the soldier would not be confined to three; he is treated, I apprehend, exactly as civilian lunatics in the working class would be?—In the different asylums I presume he is. I do not call to mind the fact of seeing any soldier in an asylum. The three cases that I allude to are simply two cases that were removed into Scotland by the relieving officer, and the other the case of a man who was found to be living in a very wretched condition in a small cottage. He was found in this wretched cottage, and at our representation was afterwards removed to the workhouse.

6658. Did he remain there in the hospital?—He remained in the workhouse—in the ordinary workhouse.

6659. The treatment of pauper lunatics in Scotland is now under the consideration of the government, is it not?—A bill has been brought into the House of Commons by the Lord Advocate.

6660. What will be the effect of that bill?—The effect of that bill will be to divide the country into districts for the establishment of district asylums, and to make an arrangement with the existing chartered asylums, as they are called, and to make a legal provision for the paupers throughout the country.

6661. That will assimilate the practice very much to the county lunatic asylums in England?—Yes.

6662. When that is done there will be the same security for Scotch lunatic soldiers as for English lunatic soldiers?—Yes.

6663. Upon the whole, is it your impression that it would be advisable for the government to create a new lunatic asylum for soldiers?—It is.

6664. You are aware that at Yarmouth we did not take in all the lunatic soldiers, but merely those whose parishes or friends could not be ascertained?—Yes.

6665. You do not propose to extend it beyond what was done there?—I should be glad if it were; but speaking solely of the continuance of the present system, I think it would be very desirable to place them in a public establishment under the government.

6666. Have you the same security for the good conduct of a government establishment as for a private one?—Yes, I object very much to placing them in a private asylum.

6667. (*Sir T. Phillips.*) Take a county asylum?—That would obviate the objection.

6668. Would not it afford adequate treatment for the soldier?—Yes, I think it would, but you would have great difficulty in getting suitable arrangements made.

6669. Assuming suitable arrangements to be practicable, would not a soldier be as well taken care of in a county asylum as in any asylum provided by the government?—Perhaps he might, I should place them pretty much on the same footing.

6670. Have you any grounds of preference?—I have none.

6671. (*President.*) Practically, the soldier now, wherever his parish can be discovered, does go to the county asylum?—I am afraid not sometimes, I have no good grounds for saying so, but I fear, when they are sent home, they are placed in workhouses; I have met with them in workhouses,—recently I met with one at Manchester, since I had intimation that I should very likely be examined here.

6672. (*Sir T. Phillips.*) Was not that temporarily only?—It was the case of a man, of the name of William Healy, suffering from epileptic fits, belonging to the 11th regiment of infantry; he had served in the army 11 years and four months, in New South Wales and in America.

6673. Is that the only case you are acquainted with, at present?—That is the only case.

6674. Epileptic patients are not regarded, I believe, as persons requiring the same treatment that lunatics of a different description do?—Some epileptics require very great care in their treatment; there are others, and a very considerable number, that do not.

6675. You do not know why that person was retained in the workhouse at Manchester?—He is probably retained in the workhouse in consequence of the deficiency of obtaining accommodation in the county asylum.

6676. (*President.*) The asylum is not spacious enough?—No.

6677. That would be corrected, would it not—the magistrates would be obliged to enlarge them?—I am not sure that this was a case that would be sent to an asylum.

6678. (*Sir T. Phillips.*) I think I collect from you that your opinion is not that the patient, if admitted into the county asylum, would not be properly taken care of, but that he should not be sent to the county asylum at all?—Yes.

6679. (*President.*) Practically, is it not the custom in every parish now to send them to the county asylum?—It is.

6680. You do not attach much importance to the mixing of soldiers with other persons?—Not much; I think that there are advantages on the other side; I think I have seen such advantages at Yarmouth. I consider it very important that the action of self-control should be brought into operation in the insane; at Yarmouth I have seen remarkable instances of it; whilst on drill the patients have remained perfectly obedient and quiet, and all the mental derangement apparently suspended; but the drill being over then it manifests itself again when they are left to themselves.

6681. (*Sir T. Phillips.*) Would not other employments gradually produce the same effects upon them?—Employment has that effect on all; but in the case of those men who have been accustomed to control, I consider it an advantage to bring it into operation.

6682. (*President.*) You require considerable space, and you ought to be able to exercise them in field work?—Yes.

6683. Do not you think that there is a danger as to a government establishment which does not exist in a private house, that is, of their falling into a bad state? If a private establishment gets into a bad state it dies, whereas there is a vitality in a government establishment; good or bad, it lasts for years?—I confess that I have the feeling that a government establishment is less liable to abuse than a private one.

6684. (*Sir T. Phillips.*) A county asylum would be equally safe?—Yes; I look upon that as a public establishment of that class.

6685. (*President.*) Why do you put the county asylum so high?—A county asylum, like every other public establishment, is liable to frequent inspection.

6686. So is a private asylum?—Yes, it is, but the best inspection will sometimes not attain the end that you think desirable.

6687. (*Sir T. Phillips.*) Every system which assumes the farming out of human beings by contract must expose the person farming them to the influence of self-interest?—I think so, and on that account I

hold so strong an opinion that it is not desirable to farm out any of those people.

6688. (*Sir H. K. Storks.*) Considering that lunatic soldiers never return to the ranks, and many of them have had very short service, would it not be saddling the country with a very great expense to have an asylum solely for military lunatics?—I doubt whether it would be more expensive than the present system.

6689. (*President.*) It would be more expensive to the state with regard to the public vote that was taken for it?—I doubt it; for looking at what the parishes pay, so far as they are supported by the state, I do not think it would be more expensive.

6690. Assuming that the imperial taxes and the local taxes come out of one purse, then the difference of expense, you think, is not large?—I should be inclined to think it would be more economical to make one government establishment, because you would save the expense of the transference of the patients to different parts of the country.

6691. Your number would not be so large, therefore you would have a less number among whom to divide the establishment charges?—I think that the number now under the charge of the state is sufficient to work an establishment economically.

6692. You are assuming the Yarmouth number?—Yes; I assume the number belonging to the East India Company's service also. There are now 113 men belonging to the East India Company's service in Pembroke House asylum. There are 93 of the Queen's men at Grove Hall, and at Coton Hill there are 18 officers. Then the Pembroke House return of the East India Company's officers embraces both officers and men, making a total of 224. Then in addition to this there are 14 women, making altogether now 238 in the asylums in fact.

6693. (*Sir H. K. Storks.*) Paid for by the imperial taxes?—No, by the state.

6694. Looking at the way in which the British army is recruited, would it not be fairer when those men become lunatic that they should be sent to their parishes, to be paid for by the local tax-payers, than that they should be paid for out of the general taxation of the country?—I am afraid that is a question which I cannot so well answer.

6695. (*President.*) Are you aware that the majority of soldiers who are lunatics are men of a very short service?—No.

6696. A very considerable portion are under one year; assuming that to be so, would it not be fairer that they should go back at the expense of the county in which they would have gone mad, rather than that they should be saddled upon the state?—I think there is a fairness in that.

6697. (*Sir T. Phillips.*) Suppose that you regard the state who hires the soldier as an employer of labour might do, though the employer of labour of a different class would return the man to his parish, and he would then become an inmate of a county asylum, at the charge of his parish, why should the state be placed on a different footing as to the soldier from any other employer of labour?—Put in that way, I should say it could not be so. If I were to argue the point, I should say that it is very desirable for every service to have suitable provision for any one attacked with illness during the continuance of that service.

6698. (*President.*) This is after service; the man being unfit for service is discharged?—But he is attacked whilst on service.

6699. It does not follow that it is in consequence of the service?—No.

6700. (*Mr. J. R. Martin.*) Your objection to private asylums is grounded on the opinion that there the interest and the duties of the persons who keep them are unfavourably contrasted?—Yes.

6701. That does not apply to a county asylum?—No.

6702. In fact they are on the same footing as a government military establishment would be?—

In that respect precisely, and free from all objection.

6703. (*President.*) Is there any other point that occurs to you which you would like to state in confirmation of your view that lunatic soldiers should be treated in a government establishment rather than in any other way?—My own opinion is that you had a government establishment at Yarmouth. I looked upon that as a government establishment.

6704. It was lost to us during the war?—Yes.

6705. The question is whether we should re-establish it?—I think you should.

6706. You do not think that the disadvantages of the position at Yarmouth are sufficient to induce the government, if it re-establishes the lunatic asylum, to establish it somewhere else?—That would depend very much upon what kind of buildings or what kind of site you would have to offer for it.

6707. Do you require a very different construction of building for a lunatic asylum to what you do for a hospital?—Yes; you require a great number of separate sleeping rooms. I think it is not desirable to have dormitories containing a small number, but you require a considerable number of rooms in which only one patient sleeps.

6708. What number should you say ought to be in a dormitory where the patients are fit for it?—The numbers should be from 3 to 40 and 50.

6709. (*Mr. J. R. Martin.*) Where you would have 40 or 50, the patients would be classified?—Yes.

6710. (*Dr. A. Smith.*) If you could have a good site for a lunatic establishment near the general hospital that is now building, possessing all the advantages necessary, that is to say, a fine view and a good healthy situation, do you think it would be desirable to incur the expense of raising that establishment rather than resorting to Yarmouth, considering that the moment the men land from the ship they could at once be removed to this lunatic asylum, instead of being taken first to one establishment and then sent away after a certain time to Yarmouth?—I am inclined to think that it would be better to establish the one near the other.

6711. Within a mile of the hospital—would that be distance enough?—I think so.

6712. (*President.*) Or nearer than a mile?—I do not think that it need be removed any great distance.

6713. Do you know what is the general cost of the construction of a pauper lunatic asylum, with all its appliances, per head, taking the number of lunatics that it ought to contain?—They have been very expensive; they have amounted to as much as 300*l.* per head, but some that have been recently built have been built at about 160*l.*

6714. What should you say was a fair average?—I think that for 150*l.* they might be built with all necessary requirements; too much expense has been incurred in galleries and mere passages, and a much larger number of single rooms have been built.

6715. For 100 patients you could build one for 15,000*l.*?—About that. There is one matter which I ought to mention, namely the increasing of the number at Grove Hall, Bow. There were 69 patients removed from Yarmouth to Grove Hall, and there are now there 93.

6716. Would not the war account for that, and the larger force, and the greater excitement to which the men have been exposed?—Yes; but the increase in number would also strengthen our reasons for thinking it was desirable that they should be provided for.

6717. Except that from having been increased from an accidental circumstance, the number would probably drop again?—Yes.

6718. Do you draw any distinction between a lunatic hospital and an incurable lunatic asylum?—A lunatic hospital, according to the legal term which we apply to it, is a public institution like the one at Coton Hill; we have no incurable lunatic asylum.

Samuel Gaskell,
Esq.

1 July 1857.

6719. But every lunatic hospital is to a great extent an incurable asylum?—They always have a considerable number of incurables amongst them.

6720. You are aware that it is never the practice to return a lunatic soldier to the ranks, even if cured?—I have heard so.

6721. That does not operate to shake your opinion?—It does not; my reason is, there being 238 now in asylums, and nearly all of them placed in private asylums,

I think that number is sufficient for management and for economical arrangements.

6722. What you propose is, that the Government should combine with the East India Company to build an asylum?—I think it would be a very good step to do that.

6723. Is there any other point upon which you would give any opinion?—I think not.

The witness withdrew.

Captain Robert
Laffan.

1 July 1857.

Captain ROBERT LAFFAN, R.E., examined.

6724. (*President.*) How long have you held the office of deputy-inspector of fortifications?—About two years.

6725. Can you state what are the regulations connected with the duties of the engineer's department as respects the construction and repairs of hospitals and barracks, are there any specific regulations?—Yes, very voluminous regulations.

6726. That is, with regard to the scheduled prices?—With regard to the manner in which the services shall be proposed, the manner in which the plans shall be prepared, in which the estimates shall be got up, and in which they shall be submitted, and the manner in which reports shall be made to accompany them, &c., &c.

6727. Those are all, I presume, for the purpose of securing financial objects and the object of sound construction?—Yes.

6728. Do the regulations require that the engineer officer shall consult the medical officer upon any points connected with those buildings?—That he shall consult the medical officer with respect to the site and construction of hospitals, but there is not any regulation enjoining that the engineer officer shall consult a medical officer as to the site or the construction of barracks; at the same time, in warm climates, it is always usual to do so.

6729. We have had it stated in evidence that there is a good deal of difficulty and delay in the execution of repairs of hospitals, through the number of forms and the necessary correspondence between the departments. Can you state what are the steps necessary in order to obtain the execution of a repair which is found necessary by the medical officer in a hospital?—The steps are, that a medical officer shall report the repair that is wanted to the barrack-master, and that the barrack-master should make a requisition upon the commanding engineer, and the commanding engineer is bound immediately to cause it to be repaired.

6730. He sends the barrack-master first to inspect?—The barrack-master inspects the barracks constantly.

6731. And the hospitals too?—Yes; a general hospital is always under the charge of a barrack-master.

6732. (*Sir H. K. Storks.*) Suppose that it is a new work—a drain that wants making, or improved ventilation, what would be the course pursued?—If it is a new work it must be provided for either in the annual estimate or in some special estimate.

6733. (*President.*) A new work not in the shape of an addition to a hospital, but a drain or a sewer required to secure the salubrity of an existing hospital, how would that be treated?—Under our present regulations, if it was a very pressing matter involving the expenditure of only 10*l.*, 15*l.*, or 20*l.*, the commanding engineer would order it to be done on his own responsibility, reporting every three months the sums that he expended. If it was likely to entail an expenditure of 50*l.* or 60*l.* or more, then he would report the circumstance to the inspector-general of fortifications, and forward either a sketch or description in writing, so as to give the inspector-general a proper idea of what was proposed, and he would send with his report an estimate of the expense; and then if

the expenditure were authorized he would proceed at once to execute the work.

6734. That is, if authorized by the Secretary of State?—For a work not exceeding 150*l.* the inspector-general, if it was thought very pressing, would not refer to the Secretary of State, but above 200*l.* he would.

6735. Within what time can an immediate repair be effected?—That question it is impossible to answer; the varying circumstances of different places and the various manners in which contracts have hitherto been drawn up are so different, that it is impossible to lay down a rule, or to name any time within which a large repair should be executed. The manner in which the Engineer department provides for repairs to existing buildings is by triennial contracts. They enter into contracts with various tradesmen for the performance of all work of an incidental nature appertaining to their respective trades. Scheduled lists are prepared, embracing every class and every description of work that can be contemplated at the time, and prices are placed opposite to them. The tradesmen tender to perform all work included in those lists that may be required during the next three years, either at the scheduled prices, or at so much per cent. above or below them, and those tenders are sent in to the office in Pall Mall, and the director-general of contracts generally accepts the lowest tender, provided the person can give proper references.

6736. Otherwise it is an open tender—anybody may tender?—Yes, it is a perfectly open competition; the lowest tender is generally accepted if the person making it can give proper references.

6737. Would it be any improvement to have a list of men to be relied upon on account of their reputation and character, rather than having it an open tender?—No; I do not think that we should gain much. By making it perfectly open we give to the contracts a greater appearance of fairness, and perhaps also we ensure that tenders shall come from every person who is competent. We might not be aware of the existence of many suitable parties, and we might, by limiting competition to a list, preclude ourselves from receiving very advantageous offers.

6738. If you accept the lowest tender you may get into bad hands, may you not?—The lowest tender is accepted if the person can give proper references.

6739. Cannot anybody do that?—No; we refer the subject to the commanding engineer on the spot, and he makes inquiries through the engineer officers and clerks of the works, and ascertains the character of the man, the amount of capital that he is supposed to have at his disposal, whether he has done any work of the kind before, either for government or for private individuals, whether that work has been well done, &c., &c.

6740. Do you think, from your experience, that you could effect the small repairs in any better way?—The manner in which tenders have been subdivided by the directions of the Board of Ordnance has been the cause of great embarrassment to the Engineer department, and they have more than once wished to have the system changed, but they have not succeeded.

6741. Do you mean one large contract taken by an eminent builder?—The Engineer department

*Captain Robert
Luffan.*

1 July 1857.

would wish to entrust the contract for repairs of all kinds to one individual of respectability, that the same man should contract to do all the odd jobs of all trades, whether smith's work or other work, in a given district or town. We might have in some districts a dozen triennial contractors if necessary, each contracting to perform all repairs required in the town where he resided, whether the work were smith's work, or carpenter's work, or bricklayer's work, or plumber's work, or painter's and glazier's work, and so on; we should then be able to get work executed with far greater expedition. At present the contract for smith's work is in one hand, and the contract for mason's work is in another, for bricklayer's work in a third, for painter's and glazier's work in a fourth, for other work in a fifth, and for other work in a sixth. And the consequence is, that if a window in a cavalry stables is broken the commanding engineer has to send a requisition to the carpenter to repair the sash, to the painter and glazier to paint and glaze it, to the smith to come and take off the fastenings and put on new ones, and to the bricklayer to come and fix them in the wall.

6742. Unless you can secure the fortuitous concurrence of those four people at once, the job remains undone?—Yes; for the carpenter comes and finds that the smith has not taken off the fastenings, and the painter and glazier puts himself to great trouble to come and put the glass in, and he finds that the carpenter has not mended the sash.

6743. You would put it under a builder to execute it all?—Yes; we must let the present contracts run out, but then I shall propose to entrust the whole work to one hand.

6744. Is it wise to have a contract for so long a time as a triennial contract, considering the rise and fall in the price of materials during that time?—It opens the door to our paying sometimes too much or too little for certain work; but I think on the whole that the triennial period is a good one.

6745. If a medical officer should require the walls of his hospital limewashed, or a water-closet has become stopped, within what time would that work be done? In the case of limewashing the barrack master has authority to do that immediately, without referring to any one. With regard to the other, it would depend upon the nature of the work and the number of trades concerned in repairing it.

6746. The other day I saw at Chatham some water-closets shut up and marked "for repair," and I was told that they would probably be done in a few days, whereas the work could have been done by a man in the town in the course of a morning—does that occur sometimes?—I daresay it does.

6747. There is a sum voted annually for the repair of each hospital, and though included in the gross the whole item is formed of a number of small items—is not that so?—Yes, incidental items.

6748. Could not the principal medical officer be empowered within a certain amount of cost to send for tradesmen and execute the work at once?—If you made it a rule that the medical officer should be responsible for all incidental repairs, I daresay you would find that answer. It might cost a little more, but you would get the work more quickly done.

6749. In anything of importance he could have the advice of the engineer officer, as to whether the contract was a fair one?—Yes, you would possibly ensure greater rapidity in the execution of the work, but then you would have to relieve the engineer officer from the responsibility of the incidental repairs entirely, for it would not do to have two parties responsible for the same thing.

6750. If the engineer officer were called in, without going through any ceremony, but by immediate communication to the engineer officer, and if it were stated to him that such and such things were wanted, and there was an offer to do them for so much, and he came to see whether it was a fair sum or not, that would secure the public as to the propriety of the con-

tract, would it not?—It would secure the public as to the propriety of the contract, but not with regard to the efficiency of the work, as it would be necessary that the same man who reported upon the reasonableness or otherwise of the contract, should also examine whether it had been properly executed. A tradesman might tender to do the work efficiently for 100*l.*, but he might do it at a cost of 30*l.* or 40*l.* in a very slovenly way.

6751. You would require the overlooking of some person competent to decide whether the work was well done, as well as whether the contract was fair?—Yes, in every case you would require a professional opinion.

6752. Have you ever contemplated executing small works, such as carpentering repairs, by means of a house carpenter belonging to the establishment?—I have often thought of it, both as to hospitals and barracks.

6753. I believe it is done so in the prisons, is it not?—I am not aware.

6754. Even in large private houses they find their account in keeping a man as a house carpenter?—Yes. If I had a large private house I think I should follow that plan, but I am not sure that I should recommend the government to follow it. The owner of a private house has an individual interest in seeing that this man is not idle, and if he is not there his steward is there to keep the man employed; whereas, if the government attaches permanent workmen to their great establishments, you would have to constitute some authority to see that the men were properly employed, and did their work well. And I think, seeing the abuses that that system would be open to, it is better to adhere to the present one.

6755. Do not you think that there would be quite sufficient employment in a large barracks or a large hospital for a permanent carpenter, while other tradesmen might not find anything to do?—It is possible that in a very large building there may be always something to do, sometimes in one trade, sometimes in another, but it does not follow that a carpenter should be always sure of employment.

6756. You have a great many articles made up by carpenters, such as bed shelves and bed-tables, which are made by contract, and which a man could be always at work on, making up when he was not employed on repairs?—Yes; I think if you could provide for the constant supervision of the man, it would be a good system, but I do not see the means of doing it.

6757. Do you think that the purveyor who is in charge of the material part of the hospital could not do that?—Unless he were a carpenter himself, or had a foreman under him, I do not think he would be able to do it.

6758. Who is present when a tradesman is at work in a hospital?—The tradesman receives his orders in writing, giving him a detailed description of what he is to do, and he executes the work, and during the progress of it the foreman, an officer of the engineer's department, visits the work once or twice a day to see that the work is well done, and after it has been done it is examined minutely and measured.

6759. Therefore, generally speaking, you would say that you have greater confidence in the contract system, for very small jobs, than in the employment of an artificer under the government;—Yes, I think so; I do not think that you could find, even in the largest establishment, permanent employment for an artificer.

6760. It is more difficult, is it not, to assess the cost of repairs than the cost of new work, in order to make a contract?—Large repairs are hardly ever done by contract.

6761. Are they not done by those triennial contracts?—Yes; but if a repair is likely to cost 300*l.* or 400*l.*, it is then made a matter of special estimate and special contract.

6762. Is it not difficult to measure small jobs of that kind, and to say exactly the value of them; I mean that the job may be very small and the charge may be very small, and yet be very large as compared

Captain Robert
Laffan.

1 July 1857.

with the job done?—A professional man can measure with the greatest accuracy the amount of material and the amount of labour required to execute any repair.

6763. Works done by the Engineer department are supposed to be more solid and durable, are they not, than those done by contract?—I am not aware of that. I think works done by contract, under proper supervision, are quite equal to anything that we do ourselves.

6764. Is there any truth in the supposition that the work done by the engineers is dearer?—If you add to the cost of the work done by the engineers the expense of having an engineer corps, and the pay of the men and officers, you would probably find that the work would have been done more cheaply if you could have dispensed with that body. The light in which you should look at it is this—you have these men, and you must have them, if you intend to be a military nation: and having them, it is expedient to give them employment.

6765. Do you think that contracts made under the Engineer department are higher than when they are made directly with the contractor without the intervention of the Engineer department?—Contracts are never made by the Engineer department: they are always made by the director-general of contracts. The Engineer department prepare the plans and estimates and reports, and submit them to the proper authorities, either the Secretary-of-State or some other authority, and after they have been approved and money has been voted, the Engineer department advertise for tenders calling for unlimited competition, calling on all persons to tender for the work, and stating that every party wishing for information may call at the engineer's office and see their plans and specifications and reports, and the nature of the work to be done; and then the tenders for the execution of the work are addressed, not to the Engineer department, but to the director-general of contracts in Pall-mall.

6766. You never make a contract as they do in civil life for the whole building, you always make contracts in pieces?—No, that is quite an exception. The general plan is to make a contract for the whole building, without reference to the price of materials. It is simply who shall tender to do the work according to the plans, at the lowest price.

6767. Leaving the questions of measurement and cost of materials, and his prices, to the contractor?—Yes.

6768. Is that better than dealing entirely by measurement?—Incomparably better.

6769. (*Sir H. K. Storks.*) With regard to the repairs at out-stations, do they come under the triennial contracts?—If they are small they do; if they are large and exceed 300*l.*, then there is a special contract in that out-station. We enter into no account with the contractor as to the quantity and the prices of labour, we simply give the contract to the man who gives us proper references and tenders at the lowest price.

6770. (*President.*) In the instruction of engineers, is there much space given to questions of civil engineering. I mean does their education comprise questions of sanitary engineering?—Architecture is one of the chief elements of the education of a military engineer, but civil engineering has not been very much taught.

6771. Is sanitary engineering attended to?—I hardly know what that means.

6772. Questions of drainage, sewerage, and ventilation?—I should think that ventilation has been very little considered by anybody in England up to the present time.

6773. (*Mr. J. R. Martin.*) There is no standard principle established?—No; ventilation is not an exact science.

6774. (*President.*) You have no regulations upon the subject, but you state that the practice is, in the case of a hospital, to take the opinion of the medical

officer as to the site, but with regard to barracks that is not so?—Except in warm climates.

6775. Does this reference to the medical officer go to such questions as the soil, the sub-soil, and the water supply?—We ask the medical officer to say whether it is a proper site or not. It is for him to consider what subjects to take into account. The chief points that you direct attention to in judging of a site are, the general healthiness of the situation, the facilities of drainage, the means of coming to the place and of getting away from it, and the supply of water.

6776. (*Mr. T. Alexander.*) With regard to the amount of space for each patient in hospital, and for each soldier in barracks, who decides that?—We have regulations upon the subject. I really do not know whether the medical department was consulted when the regulations were drawn up, I presume they were; but the regulations as laid down define the number of cubic feet.

6777. (*President.*) You have some barracks with larger cubical contents to the men than there are in the hospital of the same station for patients, have you not?—As we go on improving it is possible that the barrack of the present day may exceed the hospital of the last century.

6778. Is it ever the case that the men have more space in a barrack than in the ward of a hospital?—I do not remember a case of that kind.

6779. Was any medical opinion taken in building the new hospital at Winchester?—Yes. Two medical reports were made upon it, and I am sorry to say that they were diametrically opposed to one another.

6780. What was the nature of the reports?—One was favourable, and the other unfavourable to the site.

6781. Therefore, under those circumstances, you followed your own judgment?—We endeavoured by every means to get another site. We examined the place in every direction, and finding in the end that we could not get a better site at anything like a reasonable cost, we built the hospital on the present site.

6782. (*Dr. A. Smith.*) What was the cost that was required to buy the site that was considered by everybody more desirable?—£3,238.

6783. (*Sir H. K. Storks.*) Would the new site have been concurred in by all the medical officers, or would those who were in favour of the old site have condemned the new one?—I cannot tell.

6784. It was not submitted to them?—No.

6785. (*Dr. A. Smith.*) Which board was it that condemned the original site. Was it the first or the second board?—It was the second.

6786. Do you recollect whether it was not the first medical board that reported the site to be an eligible one; upon the understanding that there was no other site to be obtained, and that I went down then, and being of opinion that the site was completely objectionable, I raised the question, and a second board was then appointed in order to see whether a better site could not be procured, and they found the site to be ineligible, and condemned it?—I really cannot tell you.

6787. (*Mr. J. R. Martin.*) If a medical officer were attached to one of the departments, the engineer's or the quartermaster-general's department, in the sanitary line of his profession, as a medical topographer, a man of scientific acquirements and station, would not that be more desirable with reference to the subject of your examination than a casual reference to medical boards?—I think that an officer who held that position would find himself in a very embarrassing situation because the proper officer to refer to is the director-general of the Army Medical Department. When the inspector-general, or the Secretary-at-State, wishes to know what would be a proper site for a hospital or barrack, or wishes for any other information, he refers to the director-general of the Army Medical Department, and it is for the Army Medical Department then to take proper steps to get the best medical opinions on the subject.

Captain Robert Laffan.

1 July 1857.

6788. (*President.*) The director-general does not go himself to see every site, he deposes somebody else to do that?—Yes; all that I should contend for is, that if there is to be some one officer who is to report on all those questions, he should be attached to the staff of the Army Medical Department, and not to the staff of the inspector-general of fortifications. On the other hand, there are a vast variety of questions constantly arising which require the opinion of a medical officer, and one medical officer may be an experienced man, and able to give an opinion of very great value on one question, and yet not be experienced on another, and I think it would be better to leave it to the discretion of the director-general of the Army Medical Department, to select a fit officer for each individual case.

6789. As these are questions of great importance, would it not be an advantage that there should be one person charged by the director-general of the Army Medical Department to direct his attention solely to them?—That is a matter I can hardly give an opinion upon. I think the director-general would give a better opinion upon that.

6790. (*Sir H. K. Storks.*) With an army in the field would it not be very advisable to have a medical officer whose duty it should be to report on encampments and sites for encampments?—I presume that in the field, if it can be done, the opinion of the medical officer is always obtained before a site is selected.

6791. (*Mr. J. R. Martin.*) You are aware that in civil life, officers of health have been appointed in great cities?—Yes.

6792. Apart from the treatment of disease, whose attention is devoted exclusively to sanitary science?—I can quite understand that in certain fixed localities that may be desirable, but I do not think you could have in one man's head all the local circumstances connected with all the sites in England.

6793. But a medical topographer implies a person who is well versed and conversant with the influence of locality in all climates, and a man especially devoted to that science?—I have no doubt that it would be an advantage to have attached to the staff of the director-general of the Army Medical Department an officer who made such questions his special study.

6794. (*President.*) You were not in office when the Portsmouth hospital was built?—No, I was not.

6795. You do not, therefore, know whether the medical officers were consulted in that instance as to the site?—No.

6796. Have you brought with you the plans of Netley hospital?—Yes.

6797. Can you state how the choice of the site was made there?—In this way: Lord Panmure told the inspector-general of fortifications that he wished an officer of engineers to be sent to him, to advise him as to the choice of a site for a hospital; I was not then connected with the War Department, and Sir John Burgoyne wrote to me, and by his direction I waited upon Lord Panmure, and he told me that he wished to establish and the government intended to establish a large military hospital capable of containing 1,000 patients or upwards, and he was very anxious to select the best site for it. He stated that he considered a hospital would be best situated in the immediate vicinity of the sea, so that invalids coming from warm climates, sick or wounded men coming from any war, should be sent from the ships to the hospital at once with the least possible jolting and delay; and he considered that it would be another great advantage if that hospital could be situated in the immediate vicinity of some of our great naval stations, so that the steamers coming in and out could carry out the service of conveying those men to the hospital. He sent me to examine the neighbourhood of Portsmouth, but before starting I waited, by his lordship's directions, upon the director-general of the Army Medical Department, and stated to him Lord Panmure's wishes, and also his desire that the director-

general should appoint a medical officer to go with me to report upon the sanitary condition of any site we might select; the director-general appointed Dr. Mapleton, and he and I went down to Portsmouth, and after having examined the whole of the country there we came back, and reported to Lord Panmure that the best site we could find was in the neighbourhood of Haslar, between Haslar and Fort Monckton, but that it was not a very good one; we described the advantages and disadvantages of the site.

6798. There being marshy ground at the back?—Not exactly so, there was a salt water tidal creek, one of the inlets of the harbour. Some time afterwards Lord Panmure was informed that the neighbourhood of Porchester Castle would be better, and Dr. Mapleton went down to Porchester Castle with Sir Frederick Smith, but they reported unfavourably of the site, and about two months after that Lord Panmure sent for me, and told me that Sir James Clark had been urging very grave objections to the site at Haslar, and stated that a much better site could be found on the eastern shore of Southampton water. Lord Panmure told me to call upon Sir James Clark, and to examine and report upon any site that Sir James Clark might point out. I did so, and the director-general of the Army Medical Department appointed Dr. Mapleton to go down with me. When I called upon Sir James Clark, he stated that Haslar was objectionable from the vicinity to the existing general hospital, and as being unfavourable to the health of patients coming from warm climates; and he said that he had been often struck by the fine position of the ground sloping down to the shore near Netley, and suggested that I should go and examine and report upon it. He gave me a report from the director of the geological survey of Great Britain, upon the geological features of that part of the country, which was very favourable, stating that the whole of the country there was one mass of gravel, and Sir James Clark gave me a copy of the map of Hampshire, upon which he had marked the spot that he wished us to examine. Dr. Mapleton and I went down to examine it, and we reported that it seemed to us well adapted to form a site of a great hospital; Dr. Mapleton then went to the director-general of the Army Medical Department, and told him the result of our inspection, and pointed out to him that it was a good site in every respect; that there was a large extent of mud opposite to the site, uncovered at low water; but that from inquiries that we made on the spot, we thought the existence of that mud would not be a source of inconvenience or danger.

6799. Is it not a matter of fact that the mud is rather saving of health by keeping the sea from the peat bed below?—I can hardly answer that question.

6800. It is stated that the mud, if undisturbed, acts as a preventive against the bad consequences of the salt water reaching the peat?—I do not know what bad consequences would follow; I can only say when we examined it in May 1855, and we examined it both at high and low water and at all times; we did not perceive any inconvenience arising from it; there was no offensive smell then, and the people living on board the preventive ship, which is fixed in the mud, men, women, and children, all seemed the very pictures of health. They had been there for three or four years, and we thought if those people felt no inconvenience from it, the inmates of the great hospital, the foundation of which would be 40 feet above it, and would be removed 200 or 300 yards away from it, would not suffer.

6801. Is the mud covered at every tide?—Yes. With regard to the site after we had reported upon it to Lord Panmure, he did not immediately make up his mind that it was a good site, he caused two other sites to be examined by Dr. Mapleton and Captain Ross, Hurstmonceaux in Sussex, and Appledram in the Isle of Wight, and it was only after that in the

Captain Robert
Laffan.

1 July 1857.

month of August 1855, that he caused negotiations to be entered into, for purchasing a site at Netley.

6802. Sir James Clark only indicated a site as one that deserved examination?—He expressed a very favourable opinion of it.

6803. The medical opinion that was taken of the site was that of Dr. Mapleton?—Yes, Dr. Mapleton reported the result of his inspection to Dr. Smith, and I understood from Dr. Smith, that he went down immediately and examined the site, and reported to Lord Panmure upon it, stating that he thought it a desirable one.

6804. With regard to the plans, were those submitted to the medical officer, or were they drawn up upon any specification of what the medical officer thought best adapted for hospital purposes?—Lord Panmure appointed a committee to prepare an outlined plan of the hospital, the committee consisting of Colonel O'Brien assistant quarter-master general, who, we were informed at the Horse Guards, had given great attention to hospital construction, of Dr. Mapleton, and of myself. Lord Panmure instructed the committee to place themselves in communication with the director-general of the army medical department, and to act upon his suggestions; and the Committee, during the preparation of these plans, was in daily communication with the director-general, through Dr. Mapleton, and they adopted every suggestion that was made by the director-general.

6805. You only carried out, as an architect, the plans which were approved of on sanitary grounds by the medical officer?—My portion of the labour of the committee was simply in seeing that no architectural blunder was committed, it was not for me to say whether the wards were to be large, or small; the building was to be built for the use of the medical department, and it was for them to say what they wanted, and for me to adopt those architectural measures which were necessary to carry out their requirements.

6806. It was not specified to you that it was necessary, or advantageous, that the windows of the wards should face the sun?—That was a subject which occupied the attention of the committee very much, and Lord Panmure, in conversation with me, told me that he was of opinion that a great hospital, such as Netley, should be divided into a number of separate blocks, and that those blocks should be separated from one another by considerable intervals, but to be connected together by one good gallery of communication. When the committee met, it was a question, whether we should recommend that system of construction which is generally known as the French system of construction, or to mass the wards together. That was the first question that was discussed before the committee, and it appeared to the committee, that the question depended greatly on the number of patients that might be placed in one ward; the separate block system requires that each floor of each block should form one great ward.

6807. Not necessarily?—Yes, I think it does follow of necessity.

6808. The French hospitals are divided in the centre by a staircase and a lobby, dividing the block into two wards?—That is the plan adopted at Vincennes, but the result of that is, after having passed from one block to another through the great gallery of communication, you have to pass through the whole length of one ward before you reach another, so that one ward is merely a passage to reach another by.

6809. Unless you start from the floor below?—Then you have to make one ward a passage.

6810. No, for you may have external communications?—Then you do away with the advantage of the covered gallery.

6811. Do you attach any importance to the question of getting sun into a ward?—Yes, great importance, and I was decidedly in favour of the separate block system, provided I were permitted to place in a

ward such a number as 24 or 30; we might have divided Netley hospital into 10 blocks, but not into 20 or 30, as the covered gallery would then be of enormous length, and the expense would be so enormous, and the number of attendants would be so much increased; we therefore endeavoured to calculate how many blocks we could do with, and taking it at 10 for 100 patients each, and dividing those 100 into three floors, that gave us 33 on a floor. If we had followed the ordinary French plan of having a large ward for 30, and a small room for two or three near the staircase, we could have carried that out on that plan; but on referring to the army medical department, we found the director-general decidedly opposed to it, and all the military surgeons that we consulted were decidedly opposed to it, and all the military men we consulted were decidedly opposed to it, because they thought it would be impossible to maintain discipline in such wards.

6812. What are to be the numbers in the wards?—The numbers vary. The general number is 9; the minimum cubical space allowed to each patient is 1,400 cubic feet.

6813. Is it not more difficult to maintain discipline in a number of small wards containing 9, than in wards containing 50?—I have only been quoting the opinions of others, not my own.

6814. You made an alteration and adopted the present system in consequence of the necessity of making the wards so small as to hold only 9?—Yes.

6815. In your construction you have sacrificed, have you not, the question of the sun altogether, your only windows are to the north-east?—We had windows opening into the corridor always; we had doors and windows to each ward; in the original plans they had a door and two windows opening into the corridor.

6816. Do those windows open now down to the ground?—No, but down to within 20 inches of the ground.

6817. You can wheel a bed out through the door?—Yes.

6818. Are these French windows, or how do they open?—They are French windows.

6819. Can you open the upper part without opening the lower part, so as to screen the men from a draft?—Decidedly, we can throw back the top part.

6820. Still the sunlight would be a good deal intercepted by the piers?—Yes, if the original plan had been followed; but it has been proposed by a committee since to extend those openings.

6821. Have you not substituted a third window here (*pointing to the plan*)?—Yes, one tripartite window in place of those two (*pointing to the plan*).

6822. Would it not be better to have them made separate, so as more to diffuse the light?—Medical men think that it is not desirable to throw the light on to the patient, but that it is desirable to throw it into the centre of the room.

6823. You have now got, have you not, as much sun into the ward as you can have consistently with the existence of the corridor?—All the sun that would come in if there was no corridor, less simply that which is cut off by the columns.

6824. And by the floor of the rooms?—Yes.

6825. It is like a verandah, is it not?—Yes.

6826. Was it not represented to you that the presence of the sun has a very important effect upon the atmosphere of a hospital ward in making it more salubrious?—No, it was not.

6827. Nor that great light is very advantageous for a hospital?—We had so many different reports, that I really can scarcely repeat them. The officer who was sent to Rotterdam to get a design from what Dr. Smith considered the best hospital in Europe, came back and said that the whole of the Dutch doctors were decidedly opposed to the separate block system on account of the strong light that was thrown in from the opposite windows, producing ophthalmia.

Captain Robert Luffan.

1 July 1857.

6828. Is there any difficulty in excluding light by means of blinds and shutters when you have too much light?—You may exclude sun light.

6829. (*Mr. J. R. Martin.*) Do you apprehend that in this climate light, during any long period, proves offensive to the inmates?—Decidedly. I should say that a large building, sheltered from the northward and eastward, facing the south west, with an afternoon sun shining full upon it, would be like a hothouse, and the site at Netley has been selected on account of its being sheltered from the northward and eastward, and open to the south-west, and, on a summer afternoon, the sun will strike full upon the front of the building; I am not sure that the advantage gained by opening the corridor will not be counterbalanced by the action of the sun on an immense extent of glass.

6830. (*President.*) Do you supply shutters or venetian blinds to the windows?—Every means and appliance of that kind that may be demanded by the medical department will be immediately fixed.

6831. You do not think that there is any danger from the ward being placed in close proximity with, and joined to, the corridor, supposing that closed, and disease being communicated from one ward to another?—I think that you can ventilate a close corridor sufficiently to prevent anything of the kind.

6832. What is the mode of ventilation that you propose to use in the hospital?—The mode of ventilation that I propose to use in this hospital is, doors and windows, and an open fireplace, that is the ordinary means of natural ventilation. We give to each ward a most unusual extent of window surface and door surface, and we give to every ward an open fireplace, and, in ordinary times, that would be sufficient for the ventilation of the hospital; but as there may be seasons when it might be inexpedient to open the doors and windows, I propose to carry up through the walls of the wards ventilating shafts, or ventilating flues, to take away the vitiated air from the wards, and to have openings in those vitiated air flues closed by sliding panels, or grated openings, so that you might stop them up entirely, or open them to a partial extent, or entirely, as you found it necessary.

6833. So that you could have recourse to artificial ventilation if the natural ventilation was found insufficient?—Yes.

6834. (*Mr. T. Alexander.*) Have you any openings for fresh air with the exception of the doors and windows?—Yes, we shall have channels through which the outer air may reach the rooms, but the manner in which that air shall be conveyed into the rooms we have not yet quite fixed upon. It appears to us expedient that we should not introduce that air, as is usually done, through a vacant space round the skirting, because we think that would cause a draft along the floor, so that a man getting up and walking about would have a cold current of air striking his feet.

6835. Could you not remedy that by admitting air from the lobby?—We do not want to do that, we wish to keep the wards perfectly independent of the corridors.

6836. (*President.*) Do not you admit of cross ventilation?—You might have it if you wished, by opening the windows, and I presume that would be done in the summer, when the corridors would be open.

6837. (*Mr. J. R. Martin.*) What means of escape for the consumed air will you have?—The fire places and the air flues in the wall; there is an opening at the floor which you may open to carry away the vitiated air, and you may shut that and open another near the ceiling; and you may thus carry off the vitiated air either from the bottom or the top.

6838. (*President.*) You would trust to the corridor for the admission of air?—I think it is better not to trust to that. I think it is better to introduce any air from the free outer air than from the corridor.

6839. But in the summer time it will be the same in the corridor?—Yes.

6840. If you wanted warm air in winter, I suppose you would get it then through the corridor by heating

the corridor by stoves, and introducing the warm air from the corridor into the wards?—I should not recommend that system, I would take the air from the outside where it is perfectly pure, and carry it at once into the wards, warming it, if necessary.

6841. Will the air coming in fall on one side only, suppose the wind sets the other way for example?—I think it would, but there is no necessity for confining the supply of air to one side, you may have air coming in from both sides; I would not have it come in through the corridor, but I would carry the supply pipe under the floor of the corridor to the open air beyond.

6842. Have you made any new arrangement as to the end wards, which have a borrowed light in them, since the first plan?—I think that is improved.

6843. And in the same way with regard to the wards in the two projecting wings which face the water, those have been enlarged, have they not, by removing some of the water closets?—We had a double set of water-closets, but one is said to be enough.

6844. Those wards would be very well lighted?—Very well lighted.

6845. A new arrangement has been made for putting the water-closets in other parts of the building projecting beyond the face of the whole building?—The buildings always projected, and they project now a little more than they did.

6846. Does the division between the lobby and the water-closets reach the whole height of the ceiling, or is it merely a bulk-head?—The division between the lobby and the ward is complete.

6847. And between the lobby and the water-closets?—That is complete also.

6848. Up to the ceiling?—Yes, it was different before, but that was rectified upon the suggestion of Miss Nightingale.

6849. So that all communications with the water-closets will be cut off?—Completely.

6850. What sewer is it proposed to construct to pass under the hospital?—The construction that we thought it best to adopt was to carry one great sewer from the north-west corner of the hospital along the whole of the back of the hospital, and beyond it, and out into the sea below low-water mark.

6351. So that it does not pass under the building, but it goes round it?—It passes behind the hospital, goes a good way beyond it, and then turns towards the sea, and runs into it below low-water mark.

6852. Is there any advantage in having a very large sewer; is not sewerage more complete if the interior surface of the drain is thoroughly scoured?—It has, I think, this advantage, that if an obstruction takes place you may send a man in to remove it.

6853. Will this sewer be ventilated at a distance from the hospital, that is, trapped?—I do not think we shall find it necessary to have any ventilating openings in the great main sewer; it empties itself below low-water mark, the distance is not very great.

6854. But the gases which are generated are kept in by the water at the end of the sewer?—Yes; at the upper end we shall erect a chimney to carry off the effluvia.

6855. (*Mr. J. R. Martin.*) The lesser drains falling into the great sewer would be trapped twice over I suppose?—Yes, we should take the greatest pains to trap them properly.

6856. (*Dr. Sutherland.*) Have you calculated how many acres of ground that large sewer at Netley will drain, or what amount of population it will serve for?—I really have not. The only pains I took was to make it larger than any probable requirement would necessitate.

6857. I have seen that sewer, and with the fall it has it would drain a town of 30,000 inhabitants?—We thought it better to be on the safe side; with small pipes, if the pipes get choked, you do not know where the choking takes place.

6858. (*Dr. A. Smith.*) With reference to the large drain, what internal form do you mean to give it?—It

captain Robert
Laffan.

1 July 1857.

is built of an oval shape, egg shaped, with the narrow part downwards.

6859. Do you contemplate, as there are to be other buildings behind it, that the sewerage from those other buildings shall be carried into the principal drain, or do you contemplate that a separate large drain shall be constructed for each building?—No; I contemplate that the sewerage from the government buildings should all go into this main sewer.

6860. For instance the barrack for invalids, and the lunatic asylum which will be behind?—The main sewer, as it is arranged, will take the drainage of all the government land or buildings.

6861. (*President.*) Do you propose to have a separate laundry?—That depends upon Parliament.

6862. How do you propose that the washing shall be done?—We intend to propose to Parliament to grant us money to build a laundry.

6863. (*Sir T. Phillips.*) How did you intend to have the washing done?—We proposed a vote for the hospital, intending to propose another vote for the laundry; we always contemplated a laundry.

6864. (*President.*) Are the orderlies to sleep in small rooms adjacent to the wards?—No, I do not think that anybody but the patients ought to sleep in the hospital; that is provided for, and we propose to put the orderlies into a small building in the yard.

6865. Have you any accommodation for female nurses?—Yes, in a floor of the central building. We give them up a complete floor in the central building, and they have very good accommodation.

6866. (*Dr. A. Smith.*) Do you not contemplate that there shall be any orderlies in the wards at night?—The administration of the hospital is not my province, and if it were I should order that nobody but the patients should ever sleep there; the orderlies on duty should remain awake, and those who were not should sleep elsewhere.

6867. (*Sir T. Phillips.*) Is there to be no current of air in the wards?—I do not see how ventilation, particularly by natural means, can be effected by any means without a current of air.

6868. How would it be admitted?—From the free outer air, and the channel of communication will be carried under the floor, communicating with the free outer air on both sides of the hospital, and terminating in the centre of the room.

6869. Besides the doors and windows, you will introduce air at the bottom of the floor into some central pipe or tube, from which it is to escape into the rooms?—Yes.

6870. All these means will supply air of the temperature of the outer air?—Yes.

6871. Are there any means whereby the air can be at all tempered, with reference to the state of the atmosphere and the weather?—There are many means; you might make the tube pass round the fireplace, so that whenever you lighted a fire you would have warm air, and whenever you had no fire you would have cold air; that would not apply to the air that came in through the windows, undoubtedly.

6872. What is the elevation of the building—the basement of it—with reference to high-water mark?—The floor of the wards, on the ground floor, is about 38 feet above high-water mark.

6873. What is the foreshore there?—The foreshore, for about 50 yards, is pure shingle, and then you come upon a layer of mud and sand mixed, and then you get into pure mud.

6874. Is it much exposed to the action of heat, at low water, for a considerable space?—Yes; for about six or eight hundred yards.

6875. How far are you from the sea?—Some miles; we are within about five miles of Southampton.

6876. I suppose the mud is exposed daily for eight hours out of the 24?—Yes.

The witness withdrew.

Adjourned to Friday next at One o'clock.

Friday, 3rd July 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Col. Sir H. K. STOKES, K.C.B.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

President, the Right Honourable SIDNEY HERBERT, M.P.

JAMES BIRD, Esq., examined.

J. Bird, Esq.

3 July 1857.

6877. (*Dr. A. Smith.*) With reference to several communications which you have made to me, have you brought the apparatus which you propose for the purpose of introducing fresh air into rooms or hospitals?—I have.

6878. Will you be kind enough to explain it to the Commissioners? Have you got a model here?—No; but the plan, I think, will explain the whole thing (*handing in the same*).

6879. How does it work?—By means of a brick introduced into the wall, whereby the external air comes in horizontally and is carried into the dwelling vertically instead of horizontally.

6880. What carries it on?—This may be placed half way up the wall, communicating either with an opening directly through the wall, or with an air-channel.

6881. This is a section of a wall, the brick going right across it?—This is the brick itself. The line here (*pointing to the plan*) would represent the external wall. I will read to the Commissioners a description of the "Vertical Air Brick." "The purpose of

"utility, for which the vertical air-brick is intended, is for the free admission of the external air into dwelling-houses or other buildings, with a view to the improvement of their sanitary condition. The design is for a hollow air-brick, having an opening at one end to admit the entrance of the external air, as shown in figure 2 on the plan, with a second opening on top surface, as shown in the same figure, for the discharge of the said external air into the room vertically. The vertical air-brick may be inserted into the wall as a bracket, or be placed on a level with the floor line, communicating in either case with the external air, and permitting of its being conveyed into the apartment vertically and above the head line, thus avoiding all risk from horizontal draughts, &c. The vertical air-brick is noiseless, self acting, cleanly, and economical. It is so cheap as to be applicable to the smallest cottage dwelling, to workshops, factories, hospitals, schools, or barracks, while it admits of the highest degree of ornament to render it suitable for the mansions of the wealthy."

The witness withdrew.

GEORGE BORLASE CHILDS, Esq., examined.

G. B. Childs,
Esq.

3 July 1857.

6882. (*President.*) What position do you hold with respect to the City police force?—I have the sole charge of the medical department.

6883. What is the strength of the City police force?—567.

6884. What has been the number of candidates for admission?—260.

6885. How many years have you taken?—I have taken the year 1856; the full complement is 588.

6886. What was the number admitted?—104.

6887. What number were rejected out of the candidates?—Before the men come before me they are examined by the commissioner as to moral character, and I find that the commissioner rejected in that year 90, and there were rejected by the surgeon from physical causes 40.

6888. What number of men were dismissed in the course of the year?—21; and 36 resigned at their own desire.

6889. How many resigned on account of bad health?—12.

6890. And how many resigned on reports made against them?—13.

6891. That is they are allowed to resign when there is some charge made against them?—Yes.

6892. How many resigned or were rejected on probation?—12.

6893. For what reason?—Either from caprice on their part or from incapacity.

6894. What number retired on pensions?—Three.

6895. How many deaths were there?—Three.

6896. What was the minimum age on admission?—Twenty one years.

6897. And the maximum?—32.

6898. What was the average age of the men admitted in 1856?—25·72.

6899. What is the minimum height of the men?—Five feet 8 inches.

6900. And the average height?—Five feet 9½.

6901. What is the number of married men in the force?—436.

6902. What is the number of the single men?—131.

6903. What length of time do the men on an average remain in the force?—Four years.

6904. Not more?—No; that is taking the whole force and striking an average.

6905. What are the qualifications that you exact as to character?—12 months' good character from the last situation, and a testimonial in favour from two respectable householders, not being publicans.

6906. Do you admit men whether they are married or single?—Not married men, if they have more than two children, but single men may marry when they see fit.

6907. You do not require them to ask leave?—No.

6908. The strength of the force in the year 1856 you say was 567. What proportion of those were inspectors, sub-inspectors, and constables?—In the month of January 1856 there were 500 constables, 51 sub-inspectors or serjeants, and 13 inspectors.

6909. I perceive that in the month of June there were still 501 constables, but the sub-inspectors had risen from 51 to 62, the inspectors remaining at 13?—Yes; the probability is that there were some vacancies which had been filled up.

6910. You would say, perhaps, that 61 or 62 is the usual number of sub-inspectors?—Sixty-two would be about the full complement.

6911. Are the causes of rejection by the surgeon very much the same as the causes for which recruits are rejected in the army?—Precisely; I adopt the same principle of examination; the men are stripped, and they are examined precisely the same as recruits are in the army.

6912. As the age is greater than in the case of recruits, your rejections are larger in proportion to the number?—I have not struck the comparative average.

6913. What were the causes of death?—There was one case of small-pox, one died from old age, and one from diseased heart.

6914. (*Sir T. Phillips.*) In the case of death from old age, what was the age at which the man died?—Between 60 and 70; he was worn out; he had been a long time in the service before entering the police. He was a night inspector in the city.

6915. Do the men suffer at all from cholera?—I lost one case in 13 years.

6916. Is diarrhœa common?—To a great extent.

6917. Dysentery or fever?—Fever very slightly, and very little dysentery.

6918. What is the sick movement of the force? Take the men in barracks first; part live in barracks and part reside at their own houses?—The single men live in barracks, and the married men live in their own houses.

6919. What is the strength of the men in barracks?—The number of men living in barracks is 135, and the men living at home are 436.

6920. What are the admissions to hospital of the men in barracks—the 131 men?—Of the 131 men in barracks, and the 436 at home, the admissions on the sick list were, 190 cases from the men in barracks, and 436 from the men at home.

6921. By "admissions into hospital" you mean the treatment of the men at home in their own houses?—Yes, we have no hospital; it is being on the sick list.

6922. What is the ratio per thousand of admissions in the year?—1450 of the men in barracks, and 1440 of the men out of barracks.

6923. How do you account for those in barracks giving a greater ratio of admissions per thousand than the men at home?—Perhaps the personal inconvenience which a single man would feel is less to begin with than it would be with the married man; the pay of the first class constable is 23s. per week, the single man would lose 1s. per day, and the married man as well, although the single man would feel the loss less than the married man, and consequently the inducement would be greater on the part of the single men to throw themselves on the sick list.

6924. What is the nature of your barracks, are they like soldiers' barracks?—Each station accommodates so many men, and there are six divisions in the city.

6925. Do the men sleep in dormitories?—They sleep in four station houses, in which the men are accommodated for sleeping and living.

6926. Are they like a barrack room?—Yes, there is a mess room.

6927. Do you know what cubic contents there are per man in the dormitory?—I cannot supply you with that at present, but I have made a return of that kind.

6928. Do you make a regular hospital stoppage?—Yes, 1s. per day, which goes to the superannuation fund.

6929. Have you a hospital?—No.

6930. You merely treat a man in his barrack room?—Yes.

6931. (*Mr. A. S. Stafford*) What course do you take in the case of infectious diseases?—I send cases of small pox to the Small Pox Hospital.

6932. (*Sir T. Phillips.*) Have you formed an opinion as to which is most conducive to health, the living in barracks or at home?—The sick movement certainly shows against the living in barracks.

6933. Do you attribute the difference to the mere fact of living in barracks as contrasted with living at home, or is there any other element that you take into account?—Probably single men take less care of themselves than married men, and perhaps do not take their proper rest.

6934. (*Dr. A. Smith.*) Has not the venereal disease something to do with it?—We have very few venereal cases in the police.

6935. (*President.*) The greater number of married men probably accounts for that?—Yes.

G. s,
Esq.
3 July 1857.

6936. (*Dr. A. Smith.*) Are there not more cases furnished by the single men than by the married men? Yes; I suppose I should not get the married men, they would not come to me, they would go elsewhere.

6937. (*Dr. J. Sutherland.*) Have you many cases of phthisis?—Only one case this year.

6938. Is there a large or small proportion of phthisis generally?—A very small proportion.

6939. Does that remark apply to the barracks as well?—Yes; the proportion is very small, in fact only one man has died of consumption this year; there were no deaths last year.

6940. When you have any bad cases, do you allow the men to remain in the dormitory with the other men who are in health?—I have felt the inconvenience of that, and I have submitted the matter to the authorities in the city; it is very improper to do it, but it has hitherto been done.

6941. (*Mr. A. S. Stafford.*) How long is it since you submitted that matter to the authorities?—About two months since.

6942. Was that the first report that was made upon the subject?—I think it was.

6943. (*President.*) Do you know what the practice is in the metropolitan police as to hospitals?—No; but I think they treat the men in the same way.

6944. (*Sir H. K. Storks.*) Suppose a man is taken seriously ill, do you remove him?—If he has small pox or typhoid fever I should send him away to the Small Pox Hospital or the Fever Hospital.

6945. (*Mr. A. S. Stafford.*) In cases of consumption what is your practice?—The men are attended either at their own houses or in barracks.

6946. (*President.*) Is there much pulmonary disease among the men?—Very little.

6947. Are they very sober?—They are very temperate.

6948. You visit intemperance very severely, do you not?—Yes, they are punished for it.

6949. Would a man who was found drunk be dismissed?—That would depend upon circumstances. If he were an habitual drunkard, yes; for the first offence he would be fined or admonished; if a man is found drunk on his beat he is discharged.

6950. What clothing do the men have?—They have two suits always in use,—namely, one coat, two pairs of trousers of the current year, and the like suit of the past year; one great coat, one cape and belt, truncheon and lantern; 3s. per month are allowed the men in lieu of boots, of which each is required to possess two pairs in good condition; then he has one police hat, and a suit of plain clothes, civilian or non-official dress, which must be provided by each man at his own expense. That is to be worn when a man is watching property as a detective.

6951. (*President.*) A man has only one coat, not two?—Only one coat.

6952. What does he do if he gets wet?—He has a cape and great coat.

6953. What is the annual cost to the authorities for a man's clothing?—The annual cost is 4*l.* 5*s.* 6*d.*

6954. Including the upper great coat and the things that last over a year?—Quite so.

6955. What is the pay of the men?—A first class constable receives 23*s.* per week, the second class constable 22*s.*, and the third class 20*s.*

6956. What do the serjeants and inspectors get?—The inspectors pay is about 120*l.* a year; a serjeant receives 28*s.* per week.

6957. Do you give a man the same pay during his first month's probationary duty?—Each man undergoes a month's probationary duty, and his pay is 17*s.* per week, and he continues at that amount till he is certified.

6958. How are the men fed?—They buy their own rations out of their pay.

6959. They buy what they choose; you do not interfere?—Yes.

6960. Do the unmarried men mess together?—Yes, they do. Of course their meals are very irregular; they have no regular hour of messing like the army.

6961. Do you know what their ration is practically?—I can only give a rough guess. Generally rump steaks and mutton chops; very rarely joints.

6962. Do you think they get 11*lb.* of raw meat per day?—Yes.

6963. With bone?—They are very shrewd; they do not buy bone; they generally live on steaks.

6964. (*Mr. A. S. Stafford.*) Is their messing entirely voluntary?—Quite so.

6965. (*President.*) You do not overlook them to see that they feed themselves upon that which is most wholesome?—Not at all.

6966. (*Sir T. Phillips.*) Do they drink beer?—Yes.

6967. And spirits?—They are not controlled in this respect.

6968. (*Sir H. K. Storks.*) Are the men sober, as a body?—I should say so; they are very respectable.

6969. (*President.*) Are you satisfied with the houses which they occupy as barracks?—Some of them I have reported against. There are four in the city.

6970. Are they tolerably well ventilated?—Yes, very well; one is in Moor Lane, a newly-built station; that is No. 1 station. No. 2 station is in Smithfield. No. 3 station is in Fleet-street. No. 4 station is in Bow Lane; those are the four stations to accommodate the men.

6971. Have you ever been in the dormitories early in the morning?—Constantly.

6972. Is the air pretty sweet then?—It is not very, and that is a thing I have complained of; the men are not very cleanly.

6973. Do they close every window they can;—They shut up all the windows.

6974. Have you no means of ventilating, except by the windows?—No, and the door.

6975. There are no orifices communicating with the open air?—No; there is no regular system of ventilation.

6976. Do you contemplate any change in that respect?—Yes; it is contemplated to make very great changes.

6977. Do you recollect what is the distance between the beds of the men?—I do not; but I can fill that up.

6978. The ratio of sick is higher in the barracks than among the men living at home?—Yes.

6979. And it is higher than the ratio of sick in the dragoon guards?—Yes. In the case of the dragoon guards the admissions were 929 per 1000.

6980. And among your men the ratio per 1000 was 1440 of men living in their own houses, and 1450 of men in barracks?—Yes.

6981. How do you account for that unfavourable contrast?—The duty of the police is a more severe duty, I should imagine; they are longer on duty. The night men remain eight hours on duty; they go on at 10 o'clock at night, and go off at 6 o'clock in the morning.

6982. The force is divided into day police and night police?—Yes.

6983. Do the day men never go on night duty?—That is in the discretion of the inspectors of the different divisions.

6984. Still so long as a man is considered a day policeman he is not put to night duty?—Not unless anything of importance should occur to demand a change.

6985. How are the day police sub-divided?—The day police are sub-divided into two relays, one commencing at 6 a.m., and relieved at 10 a.m.; the second relay commences at 10 a.m., and is relieved at 2 p.m.; the first relay resumes duty at 2 p.m., and is relieved at 6 p.m.; the second relay resumes duty at 6 p.m., and is relieved at 10 p.m.

6986. The night police comes on at ten o'clock when the day police are relieved?—Yes.

6987. How long does their duty last?—Till six in the morning.

6988. For how many nights?—For seven, every night in the week.

6989. (*Sir T. Phillips.*) Throughout the year?—Yes.

6990. When do the night police who are in barracks get any sleep?—All the night police who are in barracks are supposed to be in bed at 8 a.m., and must leave it by 3 p.m. The day men are in bed by 12 p.m.; at that time the lights are extinguished and absentees noted.

6991. When you find any absentees, what is done?—They are admonished for the first offence and fined for the second.

6992. (*Mr. A. S. Stafford.*) Can you give any comparative statement of the sickness between the night men and the day men?—Yes, I will do so. The full complement would be 336 for the day duty and 231 for the night, making altogether a total of 567. I find the admissions to the sick list in 1856 were 407 day and 421 night.

6993. What is the per-centage relatively to the numbers?—139 for the day force and 161 for the night; the sick amongst the night men is greater.

6994. (*Sir T. Phillips.*) Out of how many men are you giving the proportions?—Out of 336 of a day force and 231 of a night force.

6995. There appears to be the same number of sick persons as there are men employed?—Yes.

6996. (*President.*) Do you think that is the night duty which produces that difference?—I should be disposed to attribute it to that.

6997. You have stated that the number of deaths in 1856 were three?—Yes.

6998. What was the ratio per 1,000?—5·28.

6999. What was the average of the force constantly on the sick list?—21·14.

7000. And the average per 1,000?—36·45.

7001. What was the number of days sickness per man per 1,000?—13·5 days.

7002. What was the average daily sick in the force throughout the year?—21·14.

7003. What was the ratio per 1,000 of those constantly sick?—38·8.

7004. What were the admissions upon the sick list for the year?—818.

7005. And the ratio of admissions per 1,000?—1442·6.

7006. What was the average duration of each attack of sickness?—16·6 days.

7007. What is your reason for maintaining the system of exclusive night duty, and so protracted when it is exacted from the men?—A man can appeal to the inspector or to me, and say “I wish you would place me on day duty;” but my instructions are these, to regard a man who feels himself incompetent for night duty as unfit for the force.

7008. You give the men on duty in the day relief every four hours, why not give the same relief to the men on duty at night? why keep a man on his beat for eight hours consecutively at night, when it is only four hours in the day?—Irrespective of breaking a man's rest at night and the domestic inconveniences it would occasion, I presume it is considered that night duty is less laborious, that there is less absolute work done than in the day duty.

7009. What is the population of the city?—The population of the city is 128,851, and the number of persons whose business brings them into the city daily has been estimated at about ten times the number of the residents, so that considering the amount of labour to be done in watching the stoppages in the streets and so on, there would be more tax on a man's physical powers in the day.

7010. On the other hand the responsibility is greater at night?—Yes, the night force have to watch about 16,000 houses and buildings.

7011. (*Sir H. K. Storks.*) A man cannot sit down during the eight hours that he is on duty?—No.

7012. (*Mr. A. S. Stafford.*) Are not the temptations to drink and vice generally greater at night than in the day?—Yes, that is my impression.

7013. Would not that account for the larger proportion of sickness among the night men?—A greater number of men prefer the night duty.

7014. Do many men employed in day duty apply to be put on night duty?—That has not come under my notice, but men have come in and have said to me that they preferred the night duty to the day duty, many of the older men.

7015. (*President.*) But that is not reconcileable with your statement, that the night men have asked to be put on day duty?—It would not come before me; it would come before the inspector. They generally pick out the smartest men for the day duty—the best looking and smartest men.

7016. (*Sir H. K. Storks.*) They do not put the night men on, on account of their possessing any especial qualifications, such as vigilance?—That is a matter that would rest with the inspectors.

7017. (*Sir T. Phillips.*) Are single men selected for night duty in preference to married men?—I do not know.

7018. (*Mr. J. R. Martin.*) Is the selection made for night duty with reference to a man's steadiness of conduct?—I cannot answer that question—that rests entirely with the inspectors.

7019. (*President.*) You have stated that the sick movement is rather greater among the night policemen than among the day policemen. Is there a greater number of resignations from the force on account of ill health among the night duty men than among the day duty men?—The number of resignations and retirements from bad health in 1856, was 18; one died who had been on day duty, three were pensioned from day duty, and six resigned from day duty; two died on night duty, and six resigned on night duty.

7020. Therefore there is rather an excess in the number of resignations among the night duty men?—Yes.

7021. The resignations were six each?—Yes.

7022. Therefore there was rather more resignation in proportion to their numbers among the night duty men than among the day duty men?—Yes.

7023. (*Mr. A. S. Stafford.*) After their resignations, do you follow the men at all—do you know what becomes of them as to their mortality or health?—No; they generally get into situations as porters.

7024. You cannot accurately state then the number of deaths every year in that police force?—Of those who are in the force I can.

7025. But not of those who resign?—No.

7026. (*Dr. A. Smith.*) Upon an average, how many years do the men serve in the force?—Four years.

7027. How long are they permitted to continue on the sick list before you discharge them from the force?—That is left entirely to the discretion of the surgeon.

7028. How long would you continue a man if he was suffering from some disease that could not be cured for a long period?—The order is a month, but I do not report a man in a month. If a man is off duty a month, my instructions are to make a special report upon him.

7029. If a man is suffering from serious disease, either distinct consumption or any other disease that will disqualify ever afterwards for service, would you discharge him at once or continue him on the sick list?—No, I should not discharge him. I have kept them on sometimes as long as 12 months.

7030. In a case of decided consumption?—Yes.

7031. Had you any prospect in such a case as that of the man being cured?—No, it would occur in this way. A report would be made on the state of his health, and that would be entertained by the Police Committee, who would allow him to remain on the sick list until something were done for him in the way of remuneration or pension.

7032. Is that in consideration of his having been a good man?—Yes.

7033. But that would not be the general practice?—No.

7034. If a man come to you in a state of consumption, and you used the stethoscope, and you find

G. B. Childs,
Esq.

3 July 1857.

G. B. Childs,
Esq.

3 July 1857.

decided symptoms of progressive consumption, would you continue him in the force, or how soon would you discharge him?—In a month. Probably this return will give the commission a fairer estimate of the wear and tear of the force than anything else. (*The same was handed in. See App. No. LXVIII.*)

7035. (*Sir T. Phillips.*) Do the resignations take place principally in the lower grades of the force?—I cannot tell you that.

7036. In what way could a man better his condition who was a first class constable and left the force?—I do not think he would better his condition as to his pay, but he might in this way; he would have probably more time to himself, he would have his Sundays to himself, which the policemen have not.

7037. (*Mr. J. R. Martin.*) What they are anxious for, is a position of more ease?—Yes, it is not so much the pay.

The witness withdrew.

Dr. Wm. Farr,
F.R.S.

WILLIAM FARR, M.D., F.R.S., examined.

7040. (*President.*) What office do you fill in the registrar-general's department?—I am at the head of the statistical department in that office.

7041. I believe you have made an application to have the army statistics communicated to your department to be amalgamated with, and published with, your returns?—The registrar general addressed two letters to the Secretary-at-War on that subject.

7042. Have you got them with you?—I have got the two letters.

7043. Will you state the grounds upon which that representation was made?—I will read one of the letters. This was addressed to Lord Panmure by the registrar-general, Major Graham. The date of the first letter is the 1st of December 1854. The date of the letter that I am going to read is the 10th of February 1855:—"My Lord, the 26th Section of "6 and 7 William 4. c. 86, provides for the registration of the deaths of British seamen, but no provision is made for recording in this department the deaths which occur in the British army abroad; I am aware that upon inquiry at the War Office relations may obtain information as to the last returns received respecting soldiers, but the enclosed forms show that few facilities are given to the public in making these inquiries, and that precautions are considered necessary to prevent unnecessary queries, and to limit the investigation to the nearest relatives or representatives of the party. It appears to me very desirable that in this central office, which contains the record of 20,000,000 deaths, marriages, and births which have occurred in England and Wales since 1836, a record should also be kept of the deaths of all soldiers who die abroad. I am aware that it is far from desirable to make any addition to the numerous periodical returns made by all officers commanding regiments, and I am also aware of the difficulties in time of war of obtaining the exact information as to the date and cause of death, when so many die on board transports and in distant hospitals; but I submit to your lordship that these difficulties may be easily surmounted, and that it will be a great boon to the public if arrangements can be made that I be furnished as soon as possible with a nominal return for each regiment in Her Majesty's service, of every soldier whose death has taken place in 1854; arrangements being at the same time made that similar information should be sent to me in future, at such periods as may be considered best, either monthly, quarterly, or yearly. Here the names would be indexed alphabetically, and information at once afforded to the public. I take the liberty of enclosing a form which might be used; but if your lordship is disposed to entertain the application which I thus venture to make to you, the authorities under your lordship's direc-

7038. (*President.*) Is there any other point you wish to mention?—In the early part of this year we had men pensioned off to the number of 57. The return I have handed in will show the causes of their unfitness as certified by me, the length of their service, their ages, and whether they had been on day or night duty.

7039. What were the proportions between them?—On day duty, 22 were pensioned; on night duty, 25. Both day and night, which would represent inspectors who go on and remain 48 hours on duty, both day and night, six. Then there are those who are on night duty six months alternately, viz., serjeants,—the number is four. When I had first charge of the force they used to change every month, but I found that did not agree with them, and I recommended them to be changed once in six months.

"tion will probably be able to prepare a better description of form." I will now read the answer dated the 10th of August 1855:—"Sir, I am directed "by the Secretary-at-War to state, in reply to your "letter of 10th February last, that without at present "expressing any opinion upon the suggestion you "make for the registration of the deaths in the British "army, it is found, after considering the subject, that "at the present time and during the war, the object "you have in view would involve not only a great "deal of trouble in the offices at home, but would "impose new and onerous duties upon commanding "officers abroad, which under existing circumstances "it would not be expedient to impose upon them. "Under these circumstances the Secretary-at-War is "of opinion that, for the present, the consideration of "the question had better be postponed. I have the "honour to be, Sir, your most obedient servant,

"(Signed) B. HAWES."

7044. You are aware that there are in the War Department quarterly returns of the deaths from all the stations, and from the troops at home? I was not aware of that. I understand that there is an arrangement for making certain returns.

7045. How frequently do you contemplate that a communication shall be made of the amount of mortality and sickness to the registrar-general's office?—I do not think that any particular period is mentioned; it is suggested that a return should be made to him, as the others are, quarterly or annually.

7046. Would that be sufficient for your purposes?—Yes.

7047. (*Sir H. K. Storks.*) You required nominal rolls for each regiment, did you not?—Yes, actual certificates, as it were, of all the deaths that occurred in the army.

7048. (*President.*) The nominal returns of the deaths in the army to the War Department are only annual. Would that be sufficient for your purposes?—Yes; but it would probably be advantageous, if they were made quarterly, as the returns of the civil population are made.

7049. You have two objects in view; first, you want to amalgamate with your own statistics (irrespectively of names) the mortality of the whole British population, whether at home or abroad, including, of course, the army. And the other object for which you wish a nominal return is, that the relatives should apply then to the registrar-general's office to know the fate of a man in the army, as they do now with regard to the death of a civilian?—Yes, that was the second object; it would be important that the army should have the same advantages from registration as are enjoyed by the civil population.

7050. Do you get returns from the navy?—Yes; they are made to the office under an Act of Parliament.

7051. You also get returns from merchant vessels, do you not?—Yes.

7052. Do you get returns of the death of English residents from foreign consuls?—Yes.

7053. Those are excluded?—No.

7054. (*Sir H. K. Storks.*) Do you get the colonial returns?—No.

7055. (*President.*) That would not be your object?—No; there is a registration in many of the colonies.

7056. (*Sir H. K. Storks.*) You do not get a regular return from the colonies?—We get no official return from the colonies.

7057. (*Sir T. Phillips.*) Are the returns which you receive now of deaths out of England confined to deaths which occur on ship-board?—Yes.

7058. Have you no other record of deaths out of England except such as occur on ship board?—Except those; and the returns from British consuls abroad.

7059. (*President.*) Do you imagine that it would relieve the War Office of much trouble if all the applications of relatives with respect to the deaths of soldiers were directed to you in lieu of going to the War Department?—I do not know what trouble the War Department is put to under the present arrangement, but it would give very little trouble to the department with which I am connected.

7060. You make a charge for it, do you not?—Yes.

7061. What amount?—1s. for a search to ascertain that a death has taken place, and also if a certificate is given 2s. 6d.

7062. Would it be possible for you, supposing the War Department entertained it, to make a reduced charge for all soldier's relatives on account of their being in the public service?—That might, I think, be easily arranged.

7063. (*Sir T. Phillips.*) Do those fees form a part of the stipend of the officers of the department?—No; all fees in public offices are paid into the Exchequer.

7064. (*Mr. J. R. Martin.*) You would require a nomenclature of the same kind with your own, in order to admit of a just comparison and arrangement?—It would be desirable that the ages and causes of death should be returned in nearly the same form as they are returned for the civil population.

7065. (*President.*) Are you aware that the great mass of applications by the relatives of soldiers to the War Department are not to ask whether a man is dead, but whether he is alive?—No, I was not aware of that.

7066. So far as the death is concerned, do you think you could do it with greater facility than the War Department?—I am not prepared to say whether the facility would be greater in our department, but it did occur to the registrar general that it would be desirable that the whole of the deaths among Englishmen should be registered, and under the present arrangement in making his quarterly returns, and in making his annual report, he does not state the whole mortality occurring.

7067. For that you would not want a nominal return?—Not for that purpose.

7068. Would you require to have furnished the sick movement?—It would be very desirable that we should have each individual fact; that there should be a return of the death of each soldier, stating his age, the cause of his death, and his name. We get that now from every parish in England. The returns are not made to us, as they are in France, by the local officers in the form of tables; the actual facts are sent to the registrar-general's office, and there they are analysed and thrown into such a form as you see.

7069. The French system is the reverse of what you propose. Instead of centralizing their knowledge, they disseminate it; they send an account of a man's death to be registered in his own commune, as if he was a civilian, and they have no complete statistics of the mortality of the French army?—They have complete statistics, I believe, in the War Department, but I am not aware that they are published. The

deaths of the soldiers in the Crimea appear in the civil register under the communes in which the soldier was domiciled.

7070. Scattered all over France?—Yes. I will read a paragraph from the registrar-general's last report, in which he says, "Under the 96th article of the Code Napoleon, information of the death of every French soldier, who dies out of France, should be sent home by the regimental authorities, and entered on the civil registers of his last known place of residence in France. This law had been laxly executed until the last war, when, upon a representation made to the war minister at its commencement, he replied, 'qu'il allait prendre les dispositions nécessaires pour que tous les décès militaires fussent inscrits, autant que possible, au dernier domicile connu en France.' Under these regulations about 20,000 deaths of French soldiers and sailors were registered. The present arrangements for the civil registration of the deaths of soldiers and seamen in foreign parts are unsatisfactory, both in France and in England. The deaths of French soldiers abroad are improperly confounded with the deaths in France; whereas they should appear in the general register under a separate heading, and be compared with the strength of the army abroad; at the same time the aggregate deaths should be taken into account, and set off against the aggregate births. In England, the deaths of the soldiers abroad are never inscribed upon the civil registers; and I have no means of ascertaining either the actual mortality or the causes of death of the whole of the English population, including the army and navy."

7071. I thought you said you had returns from the navy?—They are returned by the navy partially, but they are not satisfactorily given.

7072. Since when have you had those returns?—From the year 1837.

7073. (*Mr. A. S. Stafford.*) In what way are the returns incomplete?—The whole of the deaths are not returned.

7074. For what reason?—They are not returned.

7075. What class of deaths are not returned?—Some deaths on ship-board are not returned, other deaths occur in hospitals ashore, in foreign countries.

7076. (*Sir H. K. Storks.*) How do you know that fact?—We know from the numbers.

7077. (*President.*) You know that the whole mortality in the navy and the numbers sent to you do not tally?—Yes.

7078. (*Sir Thomas Phillips.*) As to the army at home, are the deaths communicated to you?—The deaths of soldiers are registered as the deaths of the rest of the population in England and Scotland.

7079. With regard to the mode adopted in France, of localizing the deaths, would not that be explained by the conscription I suppose each particular district has contributed a certain portion of its population to the army?—Yes; the Code Napoleon contains a chapter on the registration of soldiers who die out of France; it is the 96th section.

7080. (*Sir J. Clark.*) Would you require the same form of return from the army?—Not precisely the same, it might be modified.

7081. But that they should give you all the essential facts?—Yes.

7082. (*President.*) Supposing that those statistics were communicated to you, would it be necessary to make any alteration in the form as to the classification of the diseases?—I think not. The nomenclature would have to be modified slightly.

7083. What is the nomenclature that is now used in the army returns?—I am not aware.

7084. Have you the classification of diseases which was discussed at Paris?—I and Doctor D'Espine drew up a nomenclature of fatal diseases which might be used throughout Europe.

7085. It was not adopted then?—The nomenclature was. We were not asked to prepare a classification, but we thought it right to throw it into the form of a classification, and our classifications were not the

*Dr. Wm. Farr,
F.R.S.*

3 July 1857.

Dr. Wm. Farr,
F.R.S.

3 July 1857.

same, and the consideration of the classification was postponed; the nomenclature was adopted.

7086. When is the classification to be discussed?—In Vienna, in September next.

7087. Do you expect that by a system of give and take, you will be able to agree upon one that will obtain throughout the whole of Europe?—We shall try it, but I am not confident of the result. The nomenclature is agreed to.

7088. (*Sir Thomas Phillips.*) Has that been adopted by various countries?—The nomenclature has.

7089. (*President.*) In the army classification they put, I think, the bowel diseases under diarrhoea and dysentery, which you put under zymotic diseases?—Yes.

7090. Therefore there is a different heading in that respect?—Yes.

7091. Have you a different heading as to fever?—Yes. Fever is put under the first class of zymotic diseases.

7092. You have a greater number of subdivisions of fever, I think. Have you febricula in your nomenclature?—No, we have not. We were anxious not to multiply the forms of fever beyond the power of discrimination. Among all the practitioners of the country we found that there were a great number of practitioners who could distinguish diseases with minute accuracy, but that the whole of the practitioners of the country would be unable to do so. We therefore have found it necessary to throw several of those forms of fever together. In the forms that we have we have yellow fever, remittent fever, ague, typhus, relapsing fever, and typhoid fever.

7093. The army return has febris intermittens, febris remittens, febris continua communis, febris icterodes, and typhus, which you have?—Yes.

7094. Have you "catacausis"?—Yes; that is very rare. We have no instance of death by spontaneous combustion in this country.

7095. I see included among the diseases of the stomach and bowels, dysentery, diarrhoea, cholera epidemica, which you put all under the head of zymotic diseases. Are they not preventible?—Yes, to a certain extent, but we do not say preventible; we put them under "zymotic." I believe a great number of deaths from those diseases may be prevented by proper sanitary arrangements.

7096. Among the diseases of the brain, in Colonel Tulloch's form, there is apoplexy, which in the army is almost invariably the result of excessive drinking?—It is impossible to say.

7097. Delirium tremens is put down as a disease of the brain?—Under the new arrangement I have proposed to put intoxication and delirium tremens under alcoholismus.

7098. Then we have in this return again a number of diseases, consisting of 43 or 44, headed as "other diseases," which have no other classification?—Yes.

7099. In looking at the returns from the Crimea, I see that all the "other diseases" produced as many as 5,631 admissions, should you say that those ought to be classified in the same manner?—I think that is a great objection to the arrangement; I believe it was not proposed as a complete arrangement nor as a nosology, but for a particular purpose.

7100. Ought not the classification to be more minute than that?—I think that as a classification it is necessarily imperfect; there can be no classification of natural objects or of diseases which does not embrace all the objects and assign a place to each. It is necessarily imperfect; it is quite clear that the arrangement there proposed was not intended to apply to all circumstances and all cases.

7101. (*Mr. J. R. Martin.*) That form applies to all the colonies wherever British soldiers serve?—Yes.

7102. (*President.*) In the first report of the registrar-general in 1839, you state in a letter to him that "Cullen's" nosology is in general use in the public services; but pathological anatomy has made great progress since the time of Cullen, and his nosology

no longer presents diseases in their presumed natural relations. It is not suited to statistical purposes and has been properly abandoned in the statistical reports on the diseases of the army, although Cullen's nosology has been used in the army medical returns down to a late period. Do you still hold that opinion, or have you seen reason to modify it?—It is quite correct, and I have seen no reason to modify it.

7103. You state that the statistics in the army are looked upon with little interest, as the people of England are in absolute ignorance on the subject, and it is to remedy that that you wish to have the military statistics incorporated with the civil?—That appears to be very desirable.

7104. Would it not be an advantage that they should be constantly before the public, and their interest excited in them?—Yes.

7105. Then you state, "By such returns the exaggeration that always attends great losses would be dissipated, and the public would be enabled to see precisely by the diseases and the mortality the sanitary condition of the British army under all the different circumstances in which it may be placed?"—Yes, I will read the passage from the report before me:—The Act has made no provision for the registration of the officers and soldiers of the army who die out of England; so that while the name, age, rank or profession, place, time, and cause of the death of every man, woman, or child that dies at home are preserved in the registers, the names of the men who uphold in arms the cause and the fame of their country abroad find no place in these records. Otherwise every family that has sent forth its sons, and has lost them in the war, would have the satisfaction of knowing that their names are inscribed in a perpetual record, whether they died at Varna, perished in Scutari, sank under the waves of the inhospitable sea, or slumber at Alma, Balaklava, and Inkermann, under the earth of the Crimea, consecrated only by their bravery. It would be useful in other respects to have authentic official returns of the deaths and the causes of death in the army as well as in the civil population; for it would at the same time dissipate the exaggeration that always attends great losses, and enable the public to see precisely, by the diseases and the mortality, the sanitary condition of the army under different circumstances."

7106. Do you propose to include only the deaths and not the diseases?—The deaths only. I should say that the registrar-general would necessarily only deal with the deaths, and only deal with them in connection with the civil population at home, so as to make his account of the deaths complete in the whole of the English nation, but by no means to supersede the separate report of diseases and mortality in the army by the army medical board.

7107. (*Sir Thomas Phillips.*) Suppose that a soldier died in New Zealand, you would desire to have a record of his death here?—Yes.

7108. Supposing him to be a civilian, then you would not have it?—No.

7109. Why?—We think that the soldier when he leaves his country is not an emigrant nor an exile, but must be considered a part of the English nation, and therefore his death ought to be registered among those of the English nation. In taking the census we include the army, therefore in returning the deaths we should return the deaths in the army. The registrar-general gets a return of the births, and by subtracting from them the total deaths, the natural increase of the population is shown.

7110. Suppose a civil officer stationed at New Zealand were to die, would you have a record of his death sent home?—No.

7111. Why?—I do not know. Colonists should be registered in the colonies. But it would be very desirable that all civil officers attached to this country should be registered in this country, as property might depend upon the registration of those lives.

Dr. Wm. Farr,
F.R.S.

3 July 1857.

7112. (*President.*) You have paid a great deal of attention to the comparative rates of mortality in different occupations, and you are acquainted, I believe, with the rates of mortality as given in the Blue Book of Army Statistics?—I have paid considerable attention to the rates of mortality prevailing in different classes of the English population, and I have prepared a short statement which I will submit to the Commissioners on that subject. I have made an estimate of what the mortality of the effective men in the army, including non-commissioned officers, privates, cavalry, infantry, and engineers would, be if the rate of mortality in the army was the same as the rate prevailing in healthy places in England. (*See Appendix No. LXX.*)

7113. That is the mortality among the males of the same age and class of life?—No; I should not say the class of life. For the purpose of the census a return of the ages of the army was procured from the commanding officers of regiments through the War Office, so that we have the number of soldiers of different ages. We have 136,277 of all ages returned, then we have the number at the age of 20 and under 25, 50,387, and the annual number of deaths at the rate prevailing in all England, 424. From another source we have the mortality at those ages in the healthy districts of England, including the whole population in 63 large districts of England; there is no selection made, the sick and the healthy are all included, just as they were taken at the census.

7114. Are any of those districts mining districts?—No; they are chiefly agricultural districts, the healthiest in England. There are 63 in different parts of the country, in Northumberland, in Devonshire, in Sussex, and all over the country; the number of deaths of such men would be 1,051, and that would give the annual rate of mortality among the effective men of the army as 7·7, or less than 8 in 1,000, at the rate prevailing among the healthy country population of England and Wales. Then I thought the Commissioners would like to see what the mortality would be if the rates were the same as those that prevail all over England, and under those conditions the number of deaths annually, among the effectives of the army, would be 1,248, and the rate of mortality would be 9·2, or rather more than 9 in 1,000 at the rate prevailing among the whole population of England and Wales. Then I thought the Commissioners would like to see what the mortality would be if it was at the same rate as in the unhealthiest cities in England, such as Manchester and Liverpool, the most unhealthy districts in England. This is such a rate of mortality as I conceive the army ought not to experience in England; the number of deaths under those circumstances would be 1,688, and the annual rate of mortality would be 12·4, or rather more than 12 in 1,000 according to the rate prevailing in one of the unhealthiest cities, Manchester. If I had taken Liverpool the result would have been just the same.

7115. What are the ages that you have given?—They are taken so as to give the mortality among the population of the same ages as that of the men of the army.

7116. What ages do you consider those to be?—They are shown in the table which I give in.

7117. (*Sir T. Phillips.*) Did you say 12 per 1,000 under the most unfavourable circumstances?—Yes, 12·4.

7118. Is the army largely recruited from the population of those towns that are unfavourably situated?—I am not prepared to answer that question.

7119. (*President.*) The household cavalry being 11·1 per 1,000, has rather the advantage of the most unhealthy cities?—Yes.

7120. But the guards, which are 19·8, are considerably worse than the most unhealthy cities?—Very much worse.

7121. Is London one of the most healthy cities?—Yes; the mortality of London is much less than that of Manchester.

7122. (*Sir H. K. Storks.*) Where do you put London in point of health?—It occupies a sort of

middle situation; it is the healthiest great city in the world.

7123. For its population?—No; I should say that there is no city of any magnitude that experiences so low a rate of mortality as London.

7124. The mortality is less in London than in Paris?—Yes.

7125. (*Sir T. Phillips.*) Or than in any other European capital?—Yes.

7126. (*President.*) It varies very much in different districts, does it not?—Yes.

7127. In Westminster the mortality is higher?—Yes.

7128. In the district of the Tower the mortality is higher?—Yes.

7129. These are two districts in which the guards are quartered?—Yes; those circumstances are unfavourable.

7130. Are the Portman barracks healthy?—Yes.

7131. (*Mr. J. R. Martin.*) For any accurate result it would be necessary to reckon London as an aggregation of many cities rather than one, the differences being so great between one quarter and the other?—Yes.

7132. (*Sir Thomas Phillips.*) That is very much influenced, is it not, by the class of people that occupy particular parts of London?—Yes. The mortality of soldiers in barracks should not vary to the same extent as the mortality of people living in districts, often of distinct occupations, and in totally different circumstances.

7133. (*President.*) Have you any other table of comparison?—I have a table in preparation of the mortality among several occupations, such as among tailors, shoemakers, carpenters, butchers, and so on. (*See Appendix LXX.*)

7134. And among miners?—Yes.

7135. And printers?—Not printers.

7136. Have you not got printers?—Only on a small scale.

7137. Printers of newspapers?—Yes; the mortality among the printers of the *Times* I could get.

7138. But the mortality among the printers of the *Times* is considerably less than that of the general scale?—Yes, it is; it was in the last return that I saw.

7139. They have taken pains to ventilate their offices and rooms, have they not?—The working rooms have been improved.

7140. And they have reduced their rate of mortality by that, have they not?—Yes.

7141. (*Sir Thomas Phillips.*) Is not the number of men employed on the *Times* too small to afford any standard of comparison?—I think not. The rate of mortality among blacksmiths is 7·7, bakers and confectioners 8·7, persons engaged in the wool, cotton, and silk manufactures 8·7, miners 8·9, carpenters and joiners 8·9, grocers 9·0, labourers 9·5, shoemakers 9·5, butchers 10·3, tailors 11·5, inn-keepers, licensed victuallers, and beer-shop keepers 11·7.

7142. (*President.*) The tailor's conditions of work are very much like the shoemakers, except that different muscles are employed in his trade?—I rather think that tailors work together in large rooms.

7143. (*Dr. J. Sutherland.*)—Is the tailor more subject to consumption than the shoemaker?—Yes, I suppose he is; the mortality ranges from 9 to 12.

7144. (*Sir T. Phillips.*) Do you include among the miners, the colliers?—Yes.

7145. In some districts of the country in the North of England, where proper arrangements are made for the ventilation of mines, the mortality is low?—It is.

7146. (*President.*) In the mines subject to fire-damp and explosion the necessity for ventilation is greater, and there are lower rates of mortality than in other mines?—Than in Staffordshire and in the Welsh districts.

7147. So that in the mines that are naturally the most dangerous there is the greatest longevity?—The mortality is the lowest.

Dr. Wm. Farr,
F.R.S

3 July 1857.

7148. (*Sir T. Phillips.*) Is the longevity in the mining class greater now than it was 20 years ago?—We have no means of determining that.

7149. How far back can you carry your calculation?—We cannot carry it back at all.

7150. (*Mr. J. R. Martin.*) You have paid much attention to the health and history of the civil communities both within the United Kingdom and abroad?—I have.

7051. You are likewise well acquainted with the sanitary history of the British army, and with the writings of medical officers on sanitary science during the last century?—It has been my duty to read them all.

7152. Has not the long neglect of sanitary science in civil life and in military bodies been mainly due to the circumstance, that no separate and independent department has existed in either community?—It always appeared to me an anomaly, that while a great number of very able men were employed for prescribing for the sick, there was no class of men who devoted their whole attention professionally to the preservation of health among the population who were not sick.

7153. The treatment of disease being of more obvious and pressing necessity, has not that department of medical science received from our profession a too exclusive attention to the prejudice of the more worthy science of hygiene?—I think decidedly it has.

7154. Has not the general interest, and that of the government, in practical hygiene been greatly increased within the United Kingdom by the recent appointment of certain qualified medical officers of health within our great cities—persons separated in their functions from the treatment of disease?—I am quite of opinion, that the only way in which we can induce a large body of men to devote themselves to hygiene, is to provide appointments of that class, where they can get adequate remuneration for their labour. The arrangements ought to be such as would secure the same amount of remuneration to them as is obtained by gentlemen who devote themselves to the treatment of the sick.

7155. Would not a like interest resulting from correspondence of duties attach to the appointment of an officer of health for the military service of the state?—There has been a constant tendency to division of labour in the several professions, and particularly in the medical profession. I conceive it would be highly advantageous to have a small class at first of men devoting the whole of their time to the study of the sanitary arrangements of the army, and making suggestions for their improvement.

7156. You think that the time has arrived when in the army, as in civil communities, a proper division of labour requires that the department for the cure shall be separated from that for the prevention of disease?—I think it would be advantageous that they should be connected, and that they should work together intimately.

7157. As cognate sciences?—I think it would be very desirable that there should be a class of men, perhaps a department, devoting itself exclusively to sanitary conditions, and the study of the sanitary conditions which would preserve the health of the army.

7158. Do you not think, with reference to the duties of a medical officer, that he should receive preliminary instruction in that department of medical science before entering upon the duties of the army?—I have always been surprised, and have greatly regretted, that there has been no such system of instruction in this country. When I was at the university at Paris there was a course of lectures on hygiene by one of the ablest men in that university, and it was attended by a majority of the students to the number of 1,200. It was attended with the greatest possible interest, and the consequence was that a general knowledge of hygiene was spread abroad in France, and was so general as to support a journal expressly devoted to that subject. When I came to England I was surprised to see that it formed no part of our course of

study here, and, so far from being encouraged, it was absolutely discouraged by our colleges; and on looking over the examinations, so far as I could gather their nature in the army and navy, there did not appear to be any examination on the subject, which I saw with great regret.

7159. Does it not result in this, that medical officers entering the public services deficient in a knowledge of that greatest branch of our profession, must, in future life, acquire that knowledge very much at the expense of the seamen and the soldiers?—I conceive that their not being acquainted with that science must render them much less useful than they otherwise would be to the army; they are a very able body of men, and quite capable of making themselves acquainted with this important branch of science, and using it with great benefit to the army and the country.

7160. The result is, that an officer of health is quite as necessary for the purposes of organized bodies as for civil communities?—I can see no distinction between the two classes of men, except that in organized bodies there is more facility for carrying out sanitary arrangements than in unorganized bodies.

7161. Would not a manual of sanitary science be of much service to a young medical officer, and save him from many difficulties that he would have to encounter in the course of his service?—Undoubtedly.

7162. Would not the possession of such a work promote emulation and competition, both of which are so necessary to the advancement of science; and would not the contemplated separation of the two departments, each having a proper head, promote so desirable an end?—I am not sure that the separation should be absolute between the two.

7163. That they should be associated, but their functions should be separated?—Yes, I always held in promoting the health and the sanitary improvement of the civil population, it was desirable that it should be carried out through the agency of the medical profession.

7164. But separately, as it is in the great cities now?—Yes, the men would receive the same medical education, but they should be engaged in discharging those two separate functions.

7165. (*Sir T. Phillips.*) You state that sanitary science has been better taught and known in France; is the sanitary state of French towns, civil or military, better than in England?—The mortality of England and France is very nearly the same.

7166. But how is the sanitary condition of French towns as compared with English towns?—In some respects it is better, and in others it is much worse.

7167. Take Paris?—It is in some respects much worse.

7168. Are the Commissioners to understand you to hold this opinion, that sanitary knowledge ought to be communicated generally to medical men; or that there should be a separate class of medical men devoted to sanitary matters?—I hold, that all who enter the medical profession should go through the same course of education, but that, in practice, it would be very desirable that different classes of men should devote themselves to different subjects; one should practice surgery, another medicine exclusively, and another sanitary science, one of the first and perhaps the most important, and, therefore, requiring all the energies and attention of a separate class of men.

7169. You do not propose that there should be a separate class of men to attend people in health and another class of men to attend them in disease, but that the man who is a medical adviser should in some shape have given to him such knowledge on sanitary subjects as will make him competent to advise what are the best sanitary conditions?—Yes, I think that every medical practitioner should be prepared to do as much as that, and I think that in a civil population it would be a great advantage to have a health officer in every district.

7170. (*President.*) Practically now the medical men that you would send for to treat you in case of

disease are not the same men that you would send for if you wanted a town put in a good sanitary state?—Not necessarily.

7171. You would probably send for a man like Dr. Duncan, of Liverpool, rather than send for Sir Benjamin Brodie or Dr. Williams?—Clearly. I conceive that it is a distinct branch of the one science of medicine.

The witness withdrew.

JOHN MILTON, Esq., examined.

7173. (*President.*) You are one of the first class clerks in the War Office, are you not?—Yes.

7174. The purveying department has been under you for some time?—Yes, the management of that branch of the hospital service.

7175. In what year was it proposed to abolish the purveying system?—Between 1830 and 1833.

7176. Was that ever carried into effect?—Not entirely. A certain number of officers of the department were retained under the title of deputy purveyors, with the intention of not filling up their vacancies when they should retire or die. They remained with that purpose, but before that object was attained it was determined that the system should be slightly extended.

7177. In what year?—About the year 1845 or 1846.

7178. (*Sir H. K. Storks.*) Where were those that were retained stationed?—At Chatham, Devonport, Dublin, and Cork; Portsmouth was under the Devonport purveyor.

7179. (*President.*) In 1853 the purveying system was completely restored, was it not?—Yes. Between those dates 1833 and 1853, we had added to the purveyors all the regiments at home, making them at the head of districts instead of purely at the head of hospitals. It was found in 1853 that the whole of the force at home was under the system of purveyors, under the title of deputy purveyors, and it was therefore determined to recognize the department as an existing department of the army.

7180. What was the cause of the restoration of the department; with what view was it done?—Partly for the purpose of relieving the surgeons of direct financial responsibilities, and partly to give a more close control of the accounts.

7181. It was wished to give to the medical officers more uninterrupted time for purely professional duties?—Yes.

7182. (*Sir H. K. Storks.*) Also with regard to supplying the hospitals?—Yes; the supplies were taken away from them at the same time with the accounts.

7183. (*President.*) Was it found under the old system, from the supply getting into the hands of the hospital surgeons, speculation had taken place?—Yes; in one regiment two serjeants volunteered to turn informers.

7184. These observations apply to Great Britain and Ireland only?—Yes.

7185. In 1856 the system was extended to the colonies, was it not?—Between 1853 and 1856 the war occurred, which caused us to add largely to the number of officers. At the late peace in 1856 it was to be decided whether those officers should be reduced or be kept up as a future nucleus of the purveying department; and Lord Panmure decided that the system should be extended to the colonies, and that we should have purveyors throughout the army, so that a school should then exist for the future service of the army.

7186. Had there been any cases of frauds in the colonies in the interval?—There were cases of irregularity, I think, in Canada; the principal medical officer there and also at Corfu, Dr. Barry, complained, particularly in the militia regiments, who were not so well acquainted with our system, that there had been irregularities.

7172. (*Dr. A. Smith.*) Could you state to the Commissioners what is the ratio of mortality among men from consumption, between 20 and 40, in the United Kingdom?—It is 3.9 per 1,000, as shown in this table, which I beg leave to hand in with the others, to which I have referred in my evidence.

The same were handed in. (*See App. No. LXX.*)

Dr. Wm. Farr,
F.R.S.

3 July 1857.

J. Milton, Esq.

7187. At present the purveying system is extended over all the colonies as well as at home?—Yes.

7188. (*Sir T. M. Phillips.*) Is it a branch of the commissariat?—No; in no way.

7189. (*President.*) The rates of pay are lower, are they not?—Yes.

7190. (*Sir T. Phillips.*) Would any benefits accrue from the purveying department being amalgamated in any shape with the commissariat department, or carried out as a branch of it?—I am not aware of any. It would be throwing a large and novel class of duties upon the commissariat, which would not probably be attended with such a careful discharge of them. I suppose that the commissariat in foreign countries must always provide meat and bread, and it would not do for the purveyor to go into the market to compete with the commissariat for provisions.

7191. He should not bid against them, but side by side with them. But he would hardly have the means of bringing up his provisions?—That depends upon whether he had his own transport as well as the commissariat.

7192. Could you provide conveniently the machinery that would be required, not so much for obtaining provisions as for bringing them up for use. Could you have that separate for the purveying department as for the commissariat?—I see no difficulty in it.

7193. (*President.*) You had it practically so in the late war. All the medical comforts were obtained by the purveyor?—Yes.

7194. (*Sir H. K. Storks.*) The contracts were made by the commissariat, were they not?—Yes.

7195. (*Mr. J. R. Martin.*) What are the advantages of having one department for the supply of meat and bread, and another department for the supply of groceries and medical comforts, and such matters, when one department might do all?—I do not think that the fact of its being all the supplying of provisions makes it all cognate, and that the commissariat, who is charged with the daily provision for 95 per cent. of the army effectives, should be charged with the special provision for 5 per cent. sick.

7196. But the purveyor is only the commissary of the hospital?—Yes, certainly.

7197. (*President.*) In England now the purveyor supplies the hospital with the bread and meat ration, as well?—Yes; he can employ the contractor of the regiment.

7198. When the war broke out the difference was that the commissariat made the contract, but the article was delivered direct to the purveyor?—Yes, direct.

7199. (*Mr. J. R. Martin.*) So that within the United Kingdom the purveyor is the commissary of the hospital?—Yes, everywhere.

7200. When he goes abroad to a colony he becomes simply a receiver of the meat and bread from the commissariat, and a distributor of minor articles?—Yes.

7201. (*President.*) Is it the same in peace as in war, in the colonies?—The extension of the purveyor's department to foreign colonies has only taken place within the last few months.

7202. In point of fact, where the commissariat and the purveyor do compete, they do not compete for the

J. Milton, Esq.

3 July 1857.

same article, for the meat for the hospital is better than that for the men?—Yes; the medical officer would not be content with the average ration.

7203. (*Sir T. Phillips.*) But the purveyor is supplied by the commissariat?—Yes; but I believe the purveyor can give a higher price for a superior article.

7204. Still the hand providing it is the commissary; he supplies the purveyor. Take for example clothing; suppose that the purveyor needs clothing for the men in the hospital, how would he provide it? would he go to the commissariat for it?—Clothing is never supplied by the commissariat, but by the quartermaster-general.

7205. (*Mr. J. R. Martin.*) What reasons were assigned in 1830 as constituting a ground for the abolition of the purveying department?—From 1830 to 1833 the force in England was reduced very low, and at that time there was little beyond the regimental system, which was not included in the purveyor's department, and it was considered that the department was more bulky than the special demands of the service required.

7206. (*President.*) It was to save the pay of so many officers that the reduction was made, was it not?—Yes.

7207. (*Mr. J. R. Martin.*) On the other hand, does not the employment of purveyors so largely in the supply of hospitals during peace deprive the commissariat of that exercise of their functions which is so necessary on the breaking out of war?—No, I think

not. It requires as much tact to provide for 95 men as for 100.

7208. Was not the commissariat establishment very much reduced on the return of peace?—Yes; but not because they had not to provide that 5 per cent. of bread and meat; yet the duties of the purveyor, which extend to so many other articles, are sufficient to justify the appointment of an officer for that department.

7209. It has been stated that on the peace the commissariat department was very much reduced?—No doubt.

7210. How long has the purveyor's department existed in the British army?—I cannot state.

7211. They are the successors of the Suttlers of old, are they not?—I should have thought that the commissariat were their successors.

7212. (*President.*) The purveyor's department existed, did it not, in the Peninsula?—Yes.

7213. Could you put in a paper to show the number of purveyors and their rates of pay?—Yes. I will lay before the Commissioners a copy of the Royal Warrant of the 31st of October 1855, by which the rates of pay were settled. (*See Appendix No. XX.*)

7214. Does the warrant say what number should be employed?—No, it does not, but I will furnish a statement showing the numbers actually employed. [The number of purveyors on full-pay in July 1857 was, at home, 14 purveyors, 10 first-class clerks, 16 second-class clerks, 14 extra clerks; total 54. Abroad, 15 purveyors, 31 first-class and 33 second-class clerks; total 79.]

The witness withdrew.

R. C. Kirby, Esq.

RICHARD CHARLES KIRBY, Esq., examined.

7215. (*President.*) I believe you are the chief examiner of accounts?—I am now accountant-general to the army, late chief examiner.

7216. Do you think that if the two stoppages, that is, the commissariat stoppage for bread and meat and the regimental stoppage for messing were combined in one fixed stoppage, and made uniform all over the world, and the commissariat undertook to supply the whole ration, including vegetables, tea, coffee, and every thing necessary for three meals, that arrangement would save much trouble in the accounts in the regiments, and afterwards in the examination of the accounts in their audit at the War Office?—Undoubtedly.

7217. Have you considered the question at all?—Yes. It has been lately very much discussed in the branch of the office to which I belong.

7218. How would that diminish the accounts in the regiments?—The simplicity of one rate of stoppage instead of two would be a great advantage.

7219. There would be a net balance of pay due to all the men at all times?—Yes, the same.

7220. With the exception of the case when a man had good conduct pay?—Yes. The regular course is to credit his gross pay, and debit the stoppage, if any. Sometimes he might be in a situation not to draw rations, for instance when a married man.

7221. (*Mr. J. R. Martin.*) You would have the system apply to peace as well as to war, would you not?—Undoubtedly.

7222. (*Sir T. Phillips.*) Might not you have a list of the men to whom rations were given, and a list of those to whom they were not given, so as to make it simply a calculation of so much per day in each case?—Yes, and the reason why there is a variation against the name.

7223. (*President.*) Should you contemplate making this change, keeping a difference between the stoppage abroad and at home of one penny to compensate for the different pay at home and abroad, or would you add the penny for beer money to the pay abroad, and have the same stoppage in both cases?—I would give the same rate of pay abroad as at home.

7224. The net balance would always be the same in either case?—Yes.

7225. Is there not a danger, if you raise the nominal pay abroad, of raising the amount of stoppage in the same degree, and of there being discontent among the men in very cheap colonies where the articles supplied would hardly cost the full amount of the nominal stoppage?—We should be very cautious not to increase the stoppage beyond the real cost to the public.

7226. But the stoppage in some colonies might be above the cost?—I take it that the present rate of stoppage is according to the cost in the cheapest colonies.

7227. In the bread and meat stoppage there is a dead loss to the government, is there not?—There is so, according to existing prices.

7228. Would there be the same simplification in the War Department as in the regimental accounts if the stoppage were made as is suggested?—There would be greater simplicity and a great saving of labour.

7229. That is to you as examining the accounts and bills, and to the board of audit in auditing them?—Yes; both operations are done in the War Office.

7230. You have a perpetual audit going on?—Yes. There is none by the audit board at all, except by what is called the local auditor, who does not go into those details.

7231. He is always following the accounts as fast as you can finish the examination?—Yes; his principal object is to see that the charges are carried to debit of the right votes.

7232. Have you ever known an officer's balance of pay withheld from the company's accounts as the stoppages could not be settled?—I have not known such a case.

7233. It does not produce that amount of delay?—No.

7234. In the late war you got over the difficulty you cut the knot and made an arbitrary settlement?—Yes. It was found that the rule of a monthly settlement between the commissary and paymaster could

not be strictly carried out; it was too complicated from the men being thrown at times into such situations as neither party was acquainted with.

7235. (*Mr. J. R. Martin.*) You think that such a state of things ought not to occur again?—I cannot say how far the exigencies of war might make them unavoidable; accounts are necessarily obliged to yield to service.

7236. (*President.*) If you had a uniform stoppage at all times, your accounts would be extremely simplified?—Yes; for example, when a man embarked or disembarked we should not be interested in the date, because his stoppage would be the same.

7237. (*Mr. J. R. Martin.*) The difficulty in the late war occurred from the commissariat being able to supply some things and not others, and a large balance

in money was due to the soldier when articles were not supplied?—I apprehend that he was generally charged with the stoppage whatever the irregularities in supplying the rations.

7238. It has been stated that the complication of accounts caused great dissatisfaction to the soldiers?—This is very probable.

7239. (*Sir T. Phillips.*) Did the stoppage from the soldier go as credit to the commissariat account at all?—No, not after the rule was altered as regarded regiments in the Crimea.

7240. The commissary is paid the amount of the disbursements, the stoppages form no part of his statement of account?—No, under the altered arrangement the stoppages were credited in the regimental accounts.

The witness withdrew.

Dr. ANDREW SMITH further examined.

7241. (*President.*) Do you consider that the number of medical officers which was allowed previously to the war was sufficient to supply the medical attendants required by the army, and at the same time permit the medical officers to receive a fair amount of leave?—No; it was much below what was required.

7242. Is the number allowed now greater than before the war?—Yes.

7243. Has that been done by an addition to the regiments at home, or by an addition to the staff?—By both.

7244. Formerly each regiment that was abroad had two assistant-surgeons?—Yes.

7245. And at home only one?—Yes.

7246. What is the system at present?—There are two everywhere.

7247. Is that in your opinion a good arrangement?—Yes.

7248. Would it not, in ordinary times, leave hardly work enough to do for three medical men in one regiment?—No. In consequence of the minié practice being now so common, one medical officer is required almost entirely for it; and if we have not one to spare we have to hire a civilian.

7249. It has been stated, that in the Guards two assistant-surgeons to a battalion are found to be too much, that they rather interfere with one another, and there is not work enough to keep them both well employed?—I should say that is not the case with regiments of the line. There are so many duties to be performed. Since the arrangement that has lately been made, of having divisions, the men have been more together than formerly, and perhaps by and bye that will be the case; but almost every regiment sends out detachments, one or two, and in that case a medical officer must go with them.

7250. Would not that object have been attained by maintaining a reserve of officers on the staff to take charge of any regiment when the assistant-surgeon was on leave?—Yes; that I considered first, and after taking every point into consideration, I thought the best way would be, to attach the officers to the regiments, and if it became necessary to have an additional number of assistant-surgeons employed, then take away some from the regiments.

7251. (*Mr. J. R. Martin.*) Meanwhile they would be better employed there than anywhere else?—Yes.

7252. (*President.*) Is not there this disadvantage in having so large a number of assistant-surgeons, that you increase the disparity between the number in the lower ranks and those in the upper ranks, and so have a difficulty in providing for so many officers by promotion?—You require a certain number of juniors.

7253. You would not have maintained as extra staff one man for every regiment at home; you

would only have to send a man to a regiment when the assistant-surgeon was on leave?—There is one thing that we avoid now in consequence of having two assistant-surgeons to each regiment abroad, we do not require to take one from each regiment. They are not required to be employed at home. We used always to have an assistant-surgeon at home belonging to a regiment abroad, doing duty at the dépôt, now we do not require that.

7254. Who serves the dépôt?—Staff medical officers.

7255. Practically, are the numbers, in proportion to the strength, about the same as before the war?—Yes.

7256. Could you furnish a return of the whole number employed before and after the war?—Yes. They were as follows:—

Before the late War with Russia—		
Inspectors-general of hospitals	-	5
Deputy inspectors-general	-	8
Staff surgeons, 1st class	-	31
Staff surgeons, 2nd class	-	49
Staff assistant-surgeons	-	83
Apothecaries	-	4
Dispensers	-	0
Regimental surgeons	-	140
Ditto assistant-surgeons	-	226
Total	-	546

This is exclusive of the Medical Officers of Royal Artillery, consisting of—

Inspector-general	-	1
Deputy inspector-general	-	1
Senior surgeons	-	6
Surgeons	-	13
Assistant-surgeons	-	26
		47

Making a general total of - 593

The Numbers employed after the late War with Russia were—

Inspectors-general of hospitals	-	6
Deputy inspectors-general	-	17
Staff surgeons, 1st class	-	30
Staff surgeons, 2nd class	-	70
Staff assistant-surgeons	-	138
Apothecaries	-	6
Dispensers	-	20
Regimental surgeons	-	145
Ditto assistant-surgeons	-	254
Total	-	686

R. C. Kirby,
Esq.

3 July 1857

Mr. A. Smith.

Dr. A. Smith.

3 July 1857.

To these must be added the Medical Officers of the Royal Artillery, consisting of—

Deputy inspector-general	-	-	1
Senior surgeons	-	-	4
Surgeons	-	-	17
Assistant-surgeons	-	-	45

67

Making a general total of - 753

7257. (*Sir H. K. Storks.*) The regimental medical officer has many out-of-door duties to attend to, has he not?—Yes; I consider that half their duties are out of doors, such as attending the sick women and children, going through the barracks, and so on.

7258. (*President.*) The number must be greater now than before the war?—Yes; before the war the number was not sufficient.

7259. Is the number greater in proportion to the strength?—Yes; I think the number is greater in proportion to the strength.

7260. Is it sufficient now?—I think so.

7261. What amount of leave do you grant to an assistant-surgeon?—I think it is six weeks or two months in a year.

7262. (*Mr. J. R. Martin.*) When you say the present number is sufficient, you mean sufficient for peace purposes?—Exactly.

7263. (*President.*) How are the officers of the medical department now generally distributed?—They are distributed partly as regimental medical officers and partly as staff. The total number of the officers belonging to the medical department is 727; of those about 440 belong to regiments.

7264. That includes surgeons and assistant-surgeon?—Yes; the remainder belong to the staff; then a certain proportion of the staff medical officers are senior officers, serving on foreign stations, and also on home stations, as principal medical officers; a certain number of the staff surgeons are doing executive duties, the remainder of the staff surgeons, and second class assistant-surgeons, are distributed according to the wants of the service.

7265. What number is employed in your office?—The office establishment consists of one deputy-inspector, as professional assistant, one staff surgeon of the second class, one apothecary, and one dispenser of medicine; that is the regular establishment.

7266. What is the use of the apothecary and dispenser of medicines?—They have to furnish all the medicines required for the different foreign stations, and for all regiments at home.

7267. Is the number sufficient for the purposes of your office?—Decidedly not; there is a constant pressure, such a constant pressure as almost prevents the possibility of doing anything correctly. At the present moment there is one staff surgeon of the first class, who is employed in purveying duties.

7268. What are those duties?—To attend to all requisitions coming from surgeons wanting extra articles, as hospital stores, &c.; he has to report whether it appears to him that these things are necessary, and then I have to apply to the War Office, whether it be for foreign or home stations.

7269. Do the requisitions for bedding always come through you?—Yes, when they are refused by the local authorities on the spot.

7270. Are they only refused by the local authority on the spot, when he has not got the article in store?—No; he will not issue the article that is wanted, because he says the sick must use the old, till they are perfectly useless; for instance, white sheets, which it is so desirable to obtain, there may be a great quantity in possession of the barrack store-keeper, yet he will not issue them till the old brown ones are useless.

7271. Those would be perfectly applicable for barrack use?—That is what I have proposed over and

over again, and so withdraw them from the hospitals. In some cases that has been done, and in others not.

7272. There are officers who, though nominally in excess in your establishments, must become permanent officers?—Yes; they must necessarily become permanent if a statistical department be sanctioned, and the purveying department be constituted, as it once was, a portion of the medical department.

7273. Then the army statistics, which are now compiled by Sir Alexander Tulloch and Dr. Balfour, would be compiled in your office?—Yes.

7274. Would you have strength enough to do that?—Yes; if the present establishment were continued we could do it; I want to retain that. I have four over the office establishment at present.

7275. Do you think, if you got rid of the temporary pressure created by the work in which you have been engaged relative to the sickness in the army in the East, that with that strength you could carry on permanently the statistics of the army?—Yes; if I were allowed a second senior officer for my office, to act as president of a statistical board, and make the prescribed periodical inspections of the general, regimental, and detachment hospitals. Until August 1854 an inspectorial officer was allowed, and during the many months he was not engaged in making inspections, he was occupied in my office in examining statistical returns and annual reports.

7276. How are the inspections of the hospitals carried on?—Partly by Dr. Dumbreck; but it is almost impossible to do it.

7277. Are you able to send Dr. Dumbreck to Ireland?—No; the regulation is that the inspector-general in Ireland shall inspect the hospitals there.

7278. Has the inspector-general inspecting officers under him, or does he inspect himself?—He inspects himself. When Dr. Forrest was here, and before he went to Gibraltar, I sent him round Great Britain to make the inspections; he was engaged in that duty for two months; afterwards he proceeded to his present station.

7279. Have you any person engaged in examining the medical registers?—No. The medical registers do not come to my office; they go to Chatham, where they are examined, and are reported on from Chatham to me.

7280. If you had a statistical department you would endeavour to make extracts, and publish accounts of the state of the health of the army, and its diseases?—Yes. That would be one of the duties of a statistical department. Then the whole of the documents ought to be in my office instead of at Chatham.

7281. But at Chatham they would be required for the purpose of the invaliding?—No, because all the invaliding documents come direct from the regiment. No register is sent to Chatham till they are no longer required at the regiment. They must keep with every regiment the registers for two years; after which they are sent to Chatham.

7282. When you want to trace out the history of a man's case, you refer back to the medical register of his regiment for some years, do you not?—Yes.

7283. Would it not be necessary to do that on the spot, say at Netley?—It could be done here. The great advantage would be in having the whole of those records in the central office.

7284. (*Sir James Clark.*) What is the object of sending them to Chatham?—We have not room for them here.

7285. (*Mr. J. R. Martin.*) In number what did the medical officers amount to during the war?—I suppose about 150 more than now.

7286. (*President.*) Is the rank of the officers in your office sufficient?—No; I think the two senior officers next to myself ought to be inspectors-general.

7287. Not deputy-inspectors?—No.

7288. Have you no inspector-general?—No, I have only one deputy-inspector and a staff surgeon of the first class. I think I ought to have two inspectors-general. I think that the officer who is in the habit of making

annual or other inspections should be an inspector-general, in order to give him weight both with the military authorities, and also with the medical officers. He would be so much senior to them that they would attend to any observations from him sooner than from a junior officer.

7289. You would have two inspectors-general, one of whom would be an inspectorial officer, to inspect hospitals in England and Scotland, and the other should be employed as the head of the statistical department?—I would have one as my assistant, to aid me in replying to the very numerous questions submitted for my opinion or decision, and likewise to act as president of all boards ordered on sick and wounded officers; the other to make the required periodical inspections of hospitals and superintend the statistical department.

7290. Would you make any division of duties, putting sanitary duties into his hand specially?—Yes, clearly.

7291. You would want two inspections of hospitals, one which referred to personal hygiene, and the medical treatment of the patients, and another with respect to the sanitary condition of the buildings, barracks, and hospitals?—Yes; but the officer employed ought to possess the requisite knowledge to enable him to do all that.

7292. (*Sir James Clark.*) Do you inspect barracks as regularly as hospitals?—Yes. They are reported upon equally.

7293. (*President.*) Are reports made on barracks, with reference to ventilation, and so on?—Yes, on the drainage of barracks, on surface drainage, and ventilation, whether crowded or not, and on every circumstance that can be supposed to be unfavourable to the health of the soldier.

7294. Can you furnish the commission with a sketch in writing, showing how you think your office ought to be constituted, what ought to be the rank of the officers, and the respective duties of each?—Yes. (*See Appendix No. XIX.*)

7295. And the rates of pay?—Yes.

7296. Do they receive any pay in addition to the substantive pay of their ranks?—No. Medical officers are the only officers who receive no addition when they are employed on staff duty.

7297. Do they receive lodging money?—Yes; they receive according to their rank. A deputy-inspector gets 31s. 6d.; a staff surgeon of the 1st class 26s.; a staff surgeon of the 2d class 21s.; and a staff assistant-surgeon 14s. a week to provide lodgings in London, which is not at all enough for the purpose, and they receive 1s. a day servant's allowance.

7298. They cannot get a servant for that?—No, nor for twice that amount.

7299. Nor can they get a lodging for 10s. a week?—No. They receive the same lodging money when they are in London, which is expensive, as in a station where they could get a lodging for 10s. All the military departments are allowed something extra when they are employed in office duties, such as the adjutant-general's office, and the quartermaster-general's office; but the medical officers receive nothing but their substantive pay.

7300. (*Sir H. K. Storks.*) But the officers who are employed in the departments to which you have referred are half-pay officers; a medical officer receives the full-pay of his rank?—Yes; but the deputy adjutant-general gets 19s. a day office pay.

7301. You are talking of the head-quarter's office?—Yes, in London, which makes his position much better than that of the deputy-inspector in my office.

7302. How much does he receive?—He gets 30s. a day; that includes everything.

7303. (*President.*) Does that cover the lodging money?—No.

7304. (*Sir H. K. Storks.*) Then he receives more than the assistant adjutant-general at head quarters?—Yes; but the latter gets an allowance for several horses.

7305. (*President.*) What number of medical men are required annually to supply the vacancies which

arise in the army medical department?—I have a document here which shows the number admitted during five years. In 1848 there were 33, in 1849 there were 21, in 1850 the number was 20, in 1851, 46, and in 1852, 40, so that the average was about 32. (*See Appendix No. VII.*)

7306. Now that your establishment is increased you have rather more?—Yes, not a great number more, perhaps two more.

7307. Did you find any difficulty before the late war in obtaining the number of young men properly educated which was required?—None.

7308. Did you find any difficulty during the war?—Great difficulty.

7309. Have you required many since the war?—Yes, a good number.

7310. Have you not reduced a good many since the war?—No, assistant-surgeons; we have reduced acting assistant-surgeons.

7311. Should you have any difficulty now in procuring candidates?—It would be impossible.

7312. Was it wise to reduce all those acting assistant-surgeons, and be obliged to take fresh men into the service?—We have given an opportunity to every one who is eligible on account of age to compete, with the view of being restored to the service.

7313. Did they generally accept the offer?—Almost every one who was not above the age; some were 32, the limit of age is 25.

7314. (*Mr. A. S. Stafford.*) Have you represented officially the difficulty or the impossibility of procuring a sufficient number of young men to join the military medical department?—Yes. I have represented it to Lord Panmure.

7315. (*President.*) Do you find great difficulty now?—Yes, great difficulty. I want about 34, and I had only on the 16th of the last month nine applicants.

7316. Do not you think that men hang back, understanding that there is likely to be a change, and wishing to see what it will be?—I think it is possible, but I think also that there are not many unemployed

7317. You stated, I think, before, that the East India Company found no such difficulty?—They have not a difficulty, but they have not the number of candidates I should have expected. I asked Dr. Scott the other day, knowing that their examination was close at hand, and I found that they had not got quite double the number of candidates, as compared with the appointments that are to be given.

7318. Still they have more than you?—Yes, they have. For 17 or 19 appointments I was told there were 30 applicants.

7319. Would you not say that among medical students the service of the East India Company, owing to its emoluments, is preferred?—No question of it.

7320. I see in the minute of Lord Dalhousie, that he argues for a change in the rates of pay and position in the East India Company's medical service, and he grounds that upon the statement that the superior advantages of the Queen's service draws the best candidates away from the East India Company's service?—I cannot reconcile that with what I know. It has been the same with us; our officers have been for months and months past saying that from the pay allowed to the army medical officers not being sufficient, we did not get the best men. I do not admit that; I think we got a very fair class of men up to the time when the East India Company threw their appointments open to competition. Then we ceased to get the best men, and if our department is not improved now, we shall get an inferior class of men.

7321. Do you not think that Lord Dalhousie's opinion may have been influenced by the fact that during the war there was greater attraction to the Queen's service than to the East India Company's?—I think it is very possible.

7322. And that the Queen's service absorbed almost all the available students?—Yes, no doubt of it. Several gentlemen applied to me to enter the medical

Dr. A. Smith.

3 July 1857.

Dr. A. Smith. service of the army with the understanding that they were to leave as soon as the war was over to go to the East India Company's service.

3 July 1857.

7323. You say you have great difficulty in obtaining candidates, how do you account for that?—I think it arises from two reasons; first, there is no great number of medical men unoccupied, and secondly, there has not been the same production of medical men in the last ten years as before; there are not medical men in the market.

7324. Is not the demand for them much greater from the increase of population and the increase of wealth?—Yes. The present medical men are all more or less employed, perhaps better employed than they would be in the army; and I have no doubt also that to a certain limited extent they hope, by pursuing this course, to compel the government to increase the pay.

7325. Did not Sir Benjamin Brodie say that he never advised a pupil to enter the army medical service, as he would do better elsewhere?—Yes, and I should say the same thing if he were a well-informed, active young medical man; I think he would do better elsewhere.

7326. The governing bodies of the royal colleges and universities of England, Ireland, and Scotland have taken into consideration the pay and advantages of the Queen's service, and have made a statement, have they not, that they are insufficient to attract good students from their schools?—I believe so; but I felt myself so situated with regard to that movement, that I did not feel that I could make myself master of what was doing, so I declined to receive any communications.

7327. (*Mr. J. R. Martin.*) Do not you conceive that there are other circumstances besides the low rate of pay which deter medical officers from entering

the British army, such as the rank not being substantive?—No, I do not think they think much about that; I do not think they know much about it.

7328. And the small distribution of honorary rank?—That has more influence upon those who are in the department, not upon those who are not in it.

7329. Is it possible for the government to attach educated men to the public service by money rewards alone?—I think so, if you gave liberal pay, whether you gave them honorary distinction or not. I think the majority of men would come for a good salary.

7330. Would such a consideration alone influence the military officers in the line?—No. They go as fighting men to acquire fame, but it would also very much influence them.

7331. Would it be considered a sufficient inducement *per se*?—Perhaps it would, if you made the salary large.

7332. In all professions, are not honorary distinctions looked to as well as emoluments?—No doubt about it.

7333. (*President.*) Have you seen a statement that was made by Mr. Rees?—Yes, I saw it at the time.

7334. He states: "If I think a young man is a promising young man, I recommend him to stay at home, and not to go into the army. I feel that he can get a living by his profession here that would remunerate him better?"—I quite agree with him.

7335. What steps would you recommend to remove the difficulty you are now experiencing in obtaining young men for the army medical service?—I would increase the rate of pay, and give other advantages which I have pointed out in my memorandum to Lord Panmure, dated 29th October 1855.

Adjourned to Monday next at One o'clock.

Monday, 6th July 1857.

PRESENT :

Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

President, The Right Honourable SIDNEY HERBERT, M.P.

Dr. A. Smith.

6 July 1857.

Dr. ANDREW SMITH further examined.

7336. (*President.*) At the end of your examination on Friday you stated that you had found great difficulties in procuring candidates for the army service, and that one of the main reasons was the want of sufficient remuneration, the present remuneration being unsatisfactory. Will you state now the rates of pay which the officers of the different grades at present receive?—I will hand in this document.—(*The same was handed in. See Appendix.*)

7337. Do you contemplate a change of the rates of pay throughout the different ranks?—In the memorandum that I furnished to Lord Panmure I did. I think that was in November 1856.

7338. The largest change, I believe, is to be in the pay of the assistant-surgeons?—I should doubt that; there are larger changes than that in the pay of the inspectors-general.

7339. You propose to raise the pay of the assistant-surgeon from 7s. 6d. to 10s.?—Yes.

7340. Will you state the changes upwards which you propose to make?—I propose to give the assistant-

surgeons on appointment 10s.—they have now 7s. 6d.—and after 10 years' service 13s. instead of 10s.

7341. But, practically, the assistant-surgeons being promoted by seniority, never serve so long as 20 years, do they?—They used to do so in old times, but not lately, not for many years.

7342. They used to serve as long in the old times, when the promotion was by selection?—When it was by seniority. After the peninsular war, there were some who had served as long as 28 years as assistant-surgeons.

7343. The vacancies above them being filled from the half-pay list?—Yes.

7344. But within your time as director-general the service has averaged 12 years?—Certainly.

7345. For that reason you do not propose to augment the pay after 20 years; but you would leave it at the same rate as now?—I take for granted that there will be no assistant-surgeons having over 20 years' service.

Dr. A. Smith.

6 July 1857.

7346. In the regimental surgeons and staff surgeons of the second class, what change do you propose to make?—On appointment 15s., after 10 years' total service 1*l.*, and after 20, 1*l.* 5s.

7347. Not on the staff?—Yes, a staff surgeon of the second class the same; after 20 years' service 1*l.* 5s. as regimental or staff surgeon of the second class.

7348. After 25 years' service do you propose any change?—No.

7349. In the Appendix to Mr. Stafford's committee, I see that you state the rates of pay for a surgeon after 10 years' total service; you do not mean to include service in the rank of assistant-surgeon as well?—Yes; I meant to include the total service in the army.

7350. For total service there it should be full-pay service in his rank?—No; full-pay service in the army.

7351. Are the Commissioners to understand that in all those cases you speak of the full-pay of the service alone?—Yes; the half-pay of the service never counts.

7352. In the pay of the staff surgeons of the first class what change do you contemplate?—On appointment 1*l.* 5s., and after 20 years' service in that rank 1*l.* 8s., and after 25 years, 30s.

7353. You do not mean 20 years' service in that rank?—No: total service.

7354. You adhere to the same rates of pay that you proposed in the Appendix to Mr. Stafford's committee?—Yes.

7355. In the other ranks, when you speak of service, do you mean total service in the army?—Yes.

7356. You think it right that the pay should depend, not upon a man's rank, but the number of years that he has served?—Yes; it is the only way of apportioning the pay fairly, taking the number of years he has served.

7357. After 25 years' service what do you propose?—1*l.* 10s.

7358. Then what do you propose should be the pay of the deputy inspectors?—On appointment 1*l.* 10s., instead of 1*l.* 4s., and after 25 years' total service 2*l.*, with no increase.

7359. But that should be final?—Yes.

7360. Then what do you propose for the inspector-generals?—On appointment 3*l.*, with no increase.

7361. That is double the present amount, is it not?—It is 1*l.* more; 2*l.* is their present full-pay, and I propose that it shall be 3*l.*, with no advance.

7362. Do you think it is wise to make the intervals between which the rise of pay shall take place so long as 10 years. Would it not be better, keeping the same financial proportions over the whole rank, to make the change more frequently, say once in five years?—I do not see any objection to that, only it would cause a good deal of writing in making out the various returns that would be required to verify the services of men.

7363. (*Sir T. Phillips*.) Surely five years is a fair period of service after which to receive an advance?—I see no objection to it myself.

7364. (*President*.) I suppose you have made a calculation that the total cost shall not exceed a certain amount?—I have not.

7365. What duties attach to the officers of each grade?—All the administrative officers are generally appointed as inspectorial officers to small and large stations; there are two classes of duties for staff surgeons of the first class, one executive, the other administrative. At Chatham they treat patients and do ward duties. All the other staff surgeons of the first class are employed as administrative officers on small foreign stations, and also on stations at home. Besides these there are six or seven employed as inspectors of recruits in the recruiting districts; but there they do not perform administrative duties; there are eight really not doing administrative duties, two at Chatham, and six in districts.

7366. You consider those who inspect recruits to be performing executive duties, but of the lowest class?—No.

7367. But you cannot put the examination of a recruit upon a par with the treatment of disease?—No; but still I should not like to have it recorded that I considered it an inferior duty.

7368. Would you consider that a man coming from five years' inspection of recruits would be equal to a medical man who came from five years' work in a hospital?—No, very likely not; but we must consider that a staff surgeon inspecting recruits in a district has all the medical duties and executive duties attaching to his position, such as attendance on all sick recruits, and all the staff, therefore he has a certain amount of executive duty, but not at all equal to the staff surgeons at Chatham.

7369. Will you explain the other duties; I understand that the first-class staff surgeon is an inspectorial officer, except at Chatham, and where he is employed on the recruiting service?—Yes; the staff surgeon of the second class and the regimental surgeon are both executive officers, the regimental surgeon treating the sick of the regiment, and the staff surgeon of the second class treating the sick of the detachment to which he may be attached.

7370. Was the object of those who first instituted the rank of first-class staff surgeon to make it an administrative or an inspectorial rank, or executive rank?—Administrative rank.

7371. Was it not stated at the time that there was so great a disproportion between the inspectorial and the executive ranks, that therefore the first-class staff surgeons ought to be created in order to increase the executive force?—Not that I am aware of. They found a difficulty in managing the physicians to the forces, and the assistant-inspectors, as they assumed to themselves, from their titles, being called physicians, a claim to do nothing but physicians' duty; which was found to be exceedingly troublesome, particularly in the Peninsula; and therefore, when an opportunity occurred of revising the different grades of the department, it was proposed to substitute for those two ranks the staff surgeon of the first class, and make him a lower rate of administrative officer.

7372. Do you think that the rank of first-class staff-surgeon has worked well?—I have no reason to say that it has not.

7373. Is that one of the ranks to which you propose to promote by selection or by seniority from the regimental and second-class staff surgeons?—In one or two instances I have promoted to that rank by selection, but generally speaking I do it by seniority.

7374. You have stated before Mr. Stafford's committee that they were taken by seniority?—Certainly, in the case of a very good officer, but a regimental surgeon I have occasionally selected for the first class, still I am always afraid that I may do injustice, from not exactly knowing a man's full powers; hence I have generally tried to take the senior.

7375. You promote to the ranks above that of first class entirely by selection?—No; I think entirely by seniority.

7376. Do you make deputy inspectors by seniority?—Yes; I hold that in the case of an officer who is qualified to take upon him administrative duties, the chances are that he will be able for the higher ranks; there is no very great difference in regard of their duties; therefore I would say, that if a man is selected from the regimental surgeons, on account of his qualifications being considered sufficient to qualify him for an administrative officer of the lower grade, there is every certainty that he will be equally eligible for the grade of inspector-general; and in order to prevent dissatisfaction among the upper ranks, after a man once gets to be made a staff surgeon of the first class, I would promote entirely by seniority to the remaining upper classes, unless it could be proved that an officer had got appointed to the administrative department who was really unfit for it.

Dr. A. Smith.

6 July 1857.

7377. Before Mr. Stafford's committee you were asked, "What is the general rule in recommending an assistant-surgeon to be made a full surgeon?" and your answer is, "The senior is promoted invariably, unless there is anything in the senior that renders it improper that he should be advanced." You are also asked, "Have you observed that rule also in other cases of promotion in the higher ranks?" and your answer is, "No; the established rule with regard to them is selection?"—That is correct; the established rule is selection, but I have been afraid to exercise that selection, and I have generally gone myself by seniority; still the rule is selection, and it was so stated by Sir James Macgrigor to the military commission of 1840.

7378. But you are in the habit of promoting, as a rule, the assistant-surgeon to be surgeon by seniority?—That is invariable, and I find no difficulty in doing it.

7379. I thought, speaking broadly, that the rule was this, that in the executive ranks promotion went by seniority, and to the administrative ranks it went by selection?—That is the rule, but I was not asked whether I had observed that rule regularly.

7380. Practically you have found it advisable not to adhere to that, but to extend seniority to the ranks above the executive?—Very generally so, but not invariably, I find a difficulty in making a selection. I daresay I could produce, since I have been at the head of the department, three or four officers whom I have selected, and whom I had no doubt about. Generally speaking, I do not select, as I could not feel certain that I was selecting the best man.

7381. Although the qualities required for the two ranks are very distinct, that is to say, the man whom you would put over another requires to possess different qualities from the man who is to act in a subordinate capacity, still you think that you can get equally efficient men by seniority as by selection?—I think it would be well to establish a rule that for the first administrative rank you should select and have no more selection, and so take by seniority, both above and below, staff surgeons of the first class.

7382. How would it answer, do you think, if you promoted to the first class by seniority, and took everything by selection above that?—That is not what I propose. I propose that when a staff surgeon of the first class is required he should be selected from the regimental surgeons, and then, as soon as he was appointed, he should go regularly on to become an inspector-general by seniority.

7383. In that way will you not have great physical disability in the upper ranks, if you take a number of the most efficient men you can find upon the list of the deputy inspectors?—That would be an exception. If a man were unable from physical disability, he would not be promoted, but as a general rule, I think seniority is the only safe one.

7384. As it is important, whatever is the general rule, that it should be adhered to, would it not be safer to go back to the old rule, and say that the executive rank shall be taken by seniority, and the administrative rank by selection, and adhere strictly to selection, of course giving the turn to the seniors, *ceteris paribus*?—It would be the best rule for the public service.

7385. (*Mr. J. R. Martin.*) And for science?—Yes.

7386. Has it not always been found, when promotion has taken place in the public service by the rule of the muster roll, it has proved a damper on energy and enterprise?—No question of it, but I do not see the way of carrying out the other.

7387. (*President.*) What you propose practically is, an alteration of the existing rule in favour of seniority?—No; what I propose is this, that in the case of staff surgeons of the first class, the first grade of administrative officers, I think you can with safety select them, and being selected, then let them be made, according to seniority, deputy inspectors,

and according to seniority from deputy-inspectors make them inspector-generals.

7388. I think you show that that is impracticable, as the men would become too old for the appointment?—No, I contemplate that you would fix a time when a man must retire.

7389. But even then the country would not give so liberal a sum for retirements as should comprise all the men who were unfit from age, and therefore you must make some selection to get the fittest men?—There are no men made deputy inspectors but those who are actually required to fill vacancies. If anything happens to a man filling a vacancy to disqualify him, he must go on half-pay, whatever that may be.

7390. Are there not great complaints made now that there are superannuated officers in the service, who are too old for the duties expected of them?—If they are inefficient, I should consider that it would be advantageous to the public service that they should retire.

7391. Then you would not promote them?—I would wish them to retire long before that. I would not have a man in the service 70 years of age.

7392. At what age do you propose that they should retire?—I propose retirement for executive officers at 50, and for administrative officers at 60 or 65, and I would compel them to retire at those ages.

7393. Have you made any calculation of the cost of the retirement of all the officers at that age?—No; but it would not be much. Few men live long after that age—after 65.

7394. (*Mr. J. R. Martin.*) Does not selection become a more easy matter in the administrative department than in the strictly professional, the medical and surgical departments?—I do not know. There is no man who believes that he is inferior to another man, and you have such a cabal formed against you, that you do not know how to meet it.

7395. Do you not find it more easy in your department to ascertain the qualities of the administrative officers than the medical and surgical qualities of regimental surgeons?—I should say, generally speaking, that I know better the qualities of the regimental surgeons, who are efficient executive officers, than I do the administrative officers, for they have little opportunity of showing whether they are good or bad, unless on such an occasion as the late war.

7396. (*President.*) But you would receive the report of a superior officer upon a regimental surgeon and a second-class staff surgeon?—The staff surgeons and others are reported upon, if there happens to be a senior medical officer on the station where they are serving.

7397. Generally speaking, staff surgeons are employed on stations which are not large enough to warrant the expense of a deputy inspector, and therefore you get no report of them?—No.

7398. (*Sir T. Phillips.*) Do you regard a staff surgeon as an administrative officer?—Yes.

7399. And you select him for his administrative qualities?—Yes, from the regimental surgeons, or staff surgeons of the second class.

7400. (*President.*) Admitting that the other is the best for the service, this is in order to get rid of the dissatisfaction and jealousies which are created by the system of selection?—Yes, that is the case.

7401. But that would be really sacrificing the interests of the service to the interests of individuals?—That is quite correct; I admit it, and if anything could be devised that would ensure the possibility of a man being fairly taken, I would say adopt selection throughout at once, but I do not see how that is to be done. From one colony the principal medical officer on one occasion reported that every one of his officers were men of great talent, though I knew that some of them were very stupid—that happened to be his way of reporting.

7402. What rank did he hold?—He was a deputy inspector-general.

7403. According to your system he would become an inspector-general?—Yes.

7404. Although clearly he was unfit for the inspector's office; was he an old man?—He was not so old, and was a very good man in other respects; but he wanted to stand, which is unfortunately too often the case, in a good position with the officers serving under him, therefore he made good reports.

7405. With regard to the lower rank, of course you would keep that strictly to promotion by seniority?—I think you must do that.

7406. There is among medical officers great discontent as to the mode in which seniority is carried out, and that I believe results from your taking seniority within a certain radius, instead of the seniority of the Army List; how does that occur?—On all stations, if a death vacancy occurs, it is filled up by an officer who is serving on the station; if it is not a death vacancy, it is filled up from the general department. That was considered desirable, because there might be a serious outbreak of yellow fever in the West Indies, and a surgeon might fall a victim to the fever, while the senior assistant-surgeon on the station might have been equally actively employed and doing excellent service, and it would be a hardship to pass him over, and bring in a man from a healthy station where he had been exposed to no disease or risk of any kind.

7407. In that case seniority would be a greater hardship than selection?—Yes, and that is the rule, in order not to injure a man who had been exposed to all the dangers, which the other would not have been.

7408. (*Mr. A. S. Stafford.*) But one man may have been present through all the sickness, and the other may have arrived only the week previously?—Yes, and he would be promoted—that is the rule; and there was another reason for it, viz., that the government is anxious not to incur too great an expense, and therefore, by promoting a man on the spot, you have not to send out a successor to the man who died; as you take an opportunity of sending a man out to supply the place of the man who is promoted, by sending him out with a detachment of troops when a medical officer is actually required to go.

7409. (*President.*) You would have the means of sending him out from England, but not from station to station?—No.

7410. (*Mr. J. R. Martin.*) In that case an assistant-surgeon might be promoted in a year?—Yes, and in less.

7411. Suppose the case of a small station, in which there is simply an assistant-surgeon, and a staff assistant-surgeon goes out this week, and the surgeon dies the next, what would take place then?—There is no station so small.

7412. What is the smallest number of medical officers that you have at any station?—I should think a dozen; the Mauritius, which is a small station, is lumped with the Cape.

7413. (*President.*) It has happened, has it not, that you have sent out a man who was senior to all on the station, except the principal medical officer, whoever it might be, and he has got a vacancy when it has occurred a few days after his arrival, superseding those who had been on the station for a long period?—I do not think that that has happened, except once, in the case of an assistant-surgeon in India, by an oversight; there are instances in which it has occurred by oversight; it has never been the practice. The only case that I know of was the case of a man in India; an old assistant-surgeon who came home, and wanted to go back again to India, he was by an oversight allowed to go back, but that was before my time,—he became first for promotion, which Sir James Macgregor and I both considered to be a hardship, and desired that it should be specially noted by the clerk, to prevent it happening again.

7414. Was there not a case in Canada, that of Mr. Rutherford?—No, I do not recollect that case, but there is a thing I should mention: suppose Mr. Rutherford had been at home, an assistant-surgeon

serving at Chatham, and a vacancy occurred in Canada for an assistant-surgeon, and Mr. Rutherford had been longest at home, it would have been the duty of the director-general, according to the regulations, to send Mr. Rutherford there, whether he was likely to take the promotion from another man or not.

7415. The case I have referred to is this:—Dr. Rutherford was, I think, the senior on the station when a death vacancy occurred in the 66th; he was the senior in Canada, and he could not be promoted because the senior in Nova Scotia, which is considered a part of the same station, was senior to him, and practically a gentleman went out from England and filled the vacancy, so that neither the one nor the other got it?—I will look into that case.

7416. Have there not been other cases of assistant-surgeons not getting their promotion in strict seniority?—Not except during the war, so far as I am aware.

7417. In the Crimea there was a Mr. Holton, who served during the whole Crimean war from Bulgaria to the capture of Sebastopol, and a Mr. Ligertwood was promoted over his head. Mr. Ligertwood never did any medical duty, but acted as secretary to Sir John Hall?—That was a special appointment; it was recommended by the Commander-in-Chief, and by Sir John Hall, and authorized by the Minister for War.

7418. And such a recommendation as that you always follow?—Yes, I always do that.

7419. Did you follow all Sir William Codrington's recommendations?—No, because there were a great many, and I could not do so.

7420. If there are many you can make a selection from them yourself?—If I ask the Minister for War if he will allow me to recommend a certain number of men for promotion, and he says no at once, there is an end of it. I do not think that any of the officers recommended by Sir William Codrington were promoted. The list was a very long one, and if they had been promoted it would have placed them all on half-pay, which I thought would be a very great injury to them, and I believe they themselves shuddered at the idea when they understood what would be the consequence.

7421. I believe you have suggested to Lord Panmure some method of getting over this difficulty, by which officers from chance get promotion over the heads of others. Have you some method by which you could rectify that, and restore the men over whose heads others go to the place which they ought to occupy?—I have proposed that their commissions should be antedated.

7422. That would remove the whole difficulty?—Yes.

7423. (*Sir T. Phillips.*) May it not be that the man who has actually had promotion is the person whom you would not select, supposing you were to determine upon his claims, because he has not served the necessary time, and his special services on the station would not in themselves give him the step?—I cannot recommend a man who has not served the time; he must have served the time in one particular rank before I can recommend him.

7424. (*President.*) You might have a whole station composed of juniors, but still the senior of those juniors would get the step?—Yes, if there was an absolute necessity for immediately filling up the vacancy.

7425. Do you not think, looking at the great value of broad and intelligible rules, that a good deal of dissatisfaction as to promotion has arisen from making such minute distinctions, which the service do not understand?—I think it is very probable that there are many points which officers do not know. They think that I have been acting unfairly, when, if they knew the circumstances which I have often mentioned to them when they complained, they would have seen that I could not have acted in any other way; whether they were satisfied with the propriety of it I cannot

Dr. A. Smith.

6 July 1857.

Dr. A. Smith. say, but I never found any man that did not think that he was the best man.

6 July 1857.

7426. If you laid down two or three broad rules, and invariably adhered to them, there would be less dissatisfaction than now exists?—Yes, if you published them. Practically I do adhere to broad rules, but they are not published.

7427. The Commander-in-Chief cannot give promotions except those which are authorized by the warrant; and therefore every officer knows exactly to what chances he is subjected; and do you not think that the medical officers are entitled to the same security?—Yes; but I think the medical officers have that security. They possess a good deal of knowledge; and it is not at all unfrequent for medical officers at Chatham to send word from Chatham to my office who are to be the persons to be promoted. They have given a whole string, showing what the promotions are to be, before I have thought anything about them, and generally speaking they are right.

7428. Still there ought to be something in black and white?—Yes.

7429. That would protect you very much, as well as give satisfaction to them?—I should like to see that.

7430. But could not you do it?—I will try to do it; but I do not know whether it is practicable or not with the medical department, serving over such an immense territory as they do; I do not think it is practicable to carry out one uniform system, and never to deviate.

7431. Is not this the fact, that men do not resent hardships which are inflicted upon them by regulations, but they do resent hardships which they think arise from individual caprice?—Certainly.

7432. If you had broad rules, which sometimes, like all broad rules, would bear hard upon individuals, you would not be held responsible?—I am not certain of that.

7433. Would not the service be more satisfactory and be as well conducted?—I think it would; but suppose a death vacancy to take place in Canada, the senior being at New Zealand, there would be a difficulty; we should be in want of a surgeon for this regiment in Canada till the senior was brought from New Zealand, which would take two years.

7434. (*Mr. J. R. Martin.*) You can always have a man to do the duty *ad interim*?—No; I am only allowed an establishment in Canada necessary to meet the stations, and I should not have a staff surgeon of the second class, the person that ought to go and take the duty—I have no extra men. If the government were to allow an extra medical staff there would be no difficulty.

7435. (*President.*) Does not the great acceleration of communication between the different parts of the world make this system of promotion less necessary?—It is less difficult now than some time ago, but I do not think that I could get a medical officer from New Zealand to go to Canada in less than 18 months.

7436. I can hardly imagine any case where the delay would be more than six months?—For instance, in Canada, suppose that a surgeon dies, his case is reported to me, and I then look to see who is the senior; that takes time. I find, for instance, that the senior is in New Zealand, and I write a letter to New Zealand requesting the principal medical officer to communicate with the general commanding, requesting that the senior shall be sent home, but the general commanding will not act upon the principal medical officer's order, nor upon mine; I therefore find it necessary to address the Commander-in-Chief, stating my reason for wishing that this officer might be sent home, and request him to write to the general commanding out in New Zealand to order him home, and when the order reaches the general it turns out that this assistant-surgeon is serving at an out-station with which there is no direct communication, hence he may take five or six weeks to come from his out-station to the capital, and then there is no vessel immediately sailing, or if there is, the man

says, "I have been so long here; I have ground," and this, that, and the other, and he begs and urges the justice of allowing him to stay a certain time in order to settle his affairs, so that perhaps he does not leave New Zealand in less than 7 or 8 months. I know such is the case.

7437. Do you mean that a man would forfeit his promotion rather than leave his station?—No; but he would think it only fair to be allowed a certain time to settle his affairs. I know that it has taken a month to come from Canada, and three months from here to New Zealand—that makes four months. Then when a man is ordered from his station to the capital, he requires a month if only to get rid of his property, and we cannot take for granted that a vessel just pops in and takes him away—that makes seven months—then the moment the man comes here, his first application is this: he has been so long out of England that he wants leave to go and see his friends.

7438. That makes in all 10 months?—Yes.

7439. That is the extreme case?—Yes; but then this regiment might have had two young assistant-surgeons at the death of the surgeon, neither of them having seen more than two or three years' service, and that regiment would be left during the whole of that time in charge of a junior assistant-surgeon, which I think would be a disadvantage to the service.

7440. Do you consider that the system you propose of antedating, and so restoring the whole progress of the rank to its original seniority, would meet the difficulty?—I think so; it would be a fair system, I think.

7441. What is the objection to it?—I know of none. I have not a positive answer, but I have an answer to one portion of my proposition. There has always existed in the department a rule that a medical officer who becomes eligible for promotion is not to be recommended for promotion if he is unwell and unable to enter upon the duties of the new rank. I found that that was working in the Crimea very hard against many officers who had contracted sickness which made them ineligible for promotion, and on that occasion I wrote to the Minister for War, and represented that it was very hard upon some particularly good officers who had contracted fever, and had been sent down to Scutari, as when they were under treatment at Scutari I was compelled to promote junior officers over them. I suggested that in future the rule should be so far modified that when an officer who had been passed over on account of bad health became eligible for promotion, and a vacancy arose, that his commission should be dated the day prior to the date of the man's commission who took the position that he would have taken had he been in health, and that was sanctioned, but the other has not yet been sanctioned, but I know of no reason why it should not be; it will be no increase of expense to the public.

7442. Have you any specified grouping together of the stations within which the seniority goes?—Yes.

7443. For example, do you regard the Mediterranean, Malta, Gibraltar, and the Ionian Islands, as one station for promotion?—Yes; and Halifax, Bermuda, Canada another, and the West Indies another.

7444. (*Mr. J. R. Martin.*) Is there any written code that shows what the stations are?—No, and that is perhaps a disadvantage; it would be very advantageous to remedy that.

7445. (*President.*) You know the rules, but the officers do not?—Generally speaking I think they do know; but I am sorry to say that some parties pretend not to know, when it answers their purpose.

7446. That would be entirely met by the publication of the rule, would it not?—Entirely.

7447. Will you put in a paper showing the manner in which the stations are divided?—Yes, I will. (*See App. No. XV.*) The Mediterranean is one station and North America and Bermuda is another station; but that has not been held to invariably. In other words, it has not been laid down so absolutely that it has been always observed; for instance, take Gibraltar at the time of the severe visitations of yellow fever; it

was made on that occasion a special station, separate from the others, because the officers were subjected to such an amount of duty that it was not considered fair to them to be classed with those not in such danger.

7448. Officers judging at a distance of the promotions, of course could not be aware of that change being made?—They become aware of a great deal. I do not know that they were aware of it, but they are aware of much more than we suppose.

7449. If you say that they know more than they profess to know, is it not important to secure that they could not possibly be ignorant of anything?—Yes; I admit that perfectly.

7450. Will you be good enough to continue your description of the stations?—The whole of the West India Islands—Jamaica is separate; the Isle of France and the Cape. As regards the Cape, the senior medical officer there has been treated differently—he has always been considered as eligible to be promoted to the Indian command, but not the other officers.

7451. For purposes of promotion India includes the Cape, but the Cape does not include India?—Neither is included in the other entirely. The principal medical officer at the Cape, who is a deputy inspector, is eligible to be moved to India, but the regimental or staff surgeons of the first class at the Cape are not necessarily eligible to be sent to India.

745 (Mr. J. R. Martin.) Was not Dr. Burke sent from the Mauritius to be inspector-general in India?—That was long before my time.

7453 (President.) How is India divided?—It is a general command.

7454. The three presidencies are put in one station?—Yes.

7455. Then take New Zealand and Australia, how is it with them?—The deputy inspectors there again are eligible to be removed to India, but not the other officers.

7456. Perhaps you will hand in a document showing the changes you propose to make?—Yes.

7457. (Sir T. Phillips.) Suppose that case to occur that you suggested, of an officer in New Zealand being senior for promotion, and the inconvenience that would arise to the service from the delay in bringing him to Canada—who would you appoint there?—The senior man who was eligible for promotion, wherever he was if within reach.

7458. Or the West Indies?—Yes; if the senior were in the West Indies decidedly he would be taken.

7459. Not the next senior, but the next that was convenient; the next senior might be at the Cape, and you might say, "It is not convenient to go for him, I will go to the West Indies"?—We might get a man from the Cape, I think.

7460. Altogether there seems to be a large amount of discretion in that case?—I know that, I take the next senior.

7461. If you think he can be got without inconvenience?—Yes.

7462. Have you ever had to deal with such a case as the New Zealand case?—Never; it has never occurred.

7463. (President.) In your evidence before Mr. Stafford's committee you mention, among other things, that they have taken, in speaking of seniority, sometimes seniority in rank, and sometimes seniority in service. Does not that amount to selection?—I have endeavoured in all cases to take seniority of service, for I found by resorting to selection I had great difficulties to contend with.

7464. Is it not a false principle when once a man is in a certain rank to compare his services with the services of a man in a lower rank?—The comparison is with men in a lower position; they are in the same rank.

7465. If you say that there is a first-class staff surgeon of 15 years' service, and you compare him with another man junior to him, but who has had longer service in the lower ranks, should you consider him senior to the other though he was junior in the rank?—Yes, though junior in the grade, and for this reason, a short service man had, from some facilities, been able to take promotion when a senior would have got it if he had been available.

7466. (Sir T. Phillips.) That is upon the principle that you stated of rewarding men for distinguished service; there are others who would have done as well if they had had an opportunity?—Upon the principle that when two or more officers of a grade are equally qualified and deserving, the one of longest service should be first promoted. Occasions may arise, however, when this course cannot be observed; thus the necessities of the service may require that A, a surgeon serving in this country, be at once promoted over B, several years his senior in service but not available from his being on a foreign station. B, however, gets promotion afterwards, and stands lower in the grade than A, but notwithstanding that I consider he has a just claim to further advancement before A.

7467. (President.) But he may have gone through much more severe service?—Yes, but I do not think it would be safe to take that generally into account in considering the claims of officers to promotion, as it is seldom possible to establish the superiority, in that respect, of one officer's services over those of others. Special service, whether from its severity or importance, always secures a certain amount of consideration.

7468. Is not that much more complicated than saying that a man is promoted for his service, and when he is once in the rank there he stands as senior to all his juniors?—Yes, it is more complicated.

7469. Is it not felt to be a grievance by the young men who are passed over?—Yes, I daresay it is, but I do not see, when a man is from necessity thrown into a certain position when he is junior in rank, that he is to be promoted again at the expense of a man who, for all I knew, would have done fully as well or better than him had he been available.

7470. It is possible that he might have done as well, but then you know that the other man has done well?—Yes, but then that officer necessarily who is not promoted, and who believes that he is an equally efficient officer as the man who is promoted with much shorter service, must feel aggrieved.

7471. Among the combatant officers, do you not suppose that similar cases occurred with men who were in the West Indies when the others were in the Crimean war?—Yes; but the medical department is as one regiment, and you have 100 regiments in the line.

7472. Take the case of the artillery, they are like one large regiment, and some men obtained advantages in the Crimea, while the men who happened to be at Hong Kong could not?—But they were not out in their regular tour of duty; they were ordered according to roster at home, and I was forced to select any man I could get hold of.

7473. The roster is a matter of luck, is it not?—No, it is fixed.

7474. But, as far as a man is concerned, whether by your selection or by roster, he may be equally lucky or unlucky?—Yes.

7475. But they do not attempt in the combatant service to compensate a man by counting previous service in a lower rank, in order to give a man seniority over his senior?—I hold notwithstanding such would be just, and that it was nothing but a mere desire to do justice made me do it, and I still see it in the same light.

7476. (Sir T. Phillips.) There you introduce selection for special reasons?—No, I take a man because I can get no other.

Dr. A. Smith.

6 July 1857.

A. Smith.
6 July 1857.

7477. (*President.*) Is there not this danger in your system, that persons do not know the motives by which you are governed, so that seniority may look like selection, and selection may look like seniority?—Quite so; but at the same time the Commander-in-Chief is open to any remonstrance.

7478. Is not almost the worst fault that you can find with the system this, that it is unintelligible to those who are affected by it?—But there are hundreds of things occur in military discipline which nobody can explain except those at head-quarters.

7479. Does not much of the dissatisfaction that is felt arise from the system being so complicated that they do not understand it, while a more simple system would be more palatable to them, as they would understand what they were about?—It would, I think, be more palatable to a few, but not to the whole body.

7480. But to the whole mass, and even to an individual, if he were passed over by regulation would it not be more palatable?—I have such a respect for justice, that I would not commit myself to an act of injustice.

7481. (*Mr. J. R. Martin.*) But may not a man be mistaken as to what is justice?—Of course he may, and so may I.

7482. (*President.*) I think the fault of the system is this, that it exposes you to the imputation of injustice where none is intended?—It does do that, but I do not care about that.

7483. Your evidence as to the necessity of going back to seniority rather than to selection, shows that you are like all other men, open to be affected by accusations of this kind?—It is my own conviction, after reasoning with myself and seeing the difficulty in making selections justly; and if you can show me that selection can be made justly, then I will not say a word against selection.

7484. The system of seniority should be so clearly conducted upon principles of seniority, that there can be no dispute about it, and the principle of selection should be clearly selection, and not have the element of seniority substituted for it, while the rule of selection still remains?—I want to know where I have deviated. I have heard many people say that I have not gone according to seniority, but I challenge any person to bring forward a case in which I have not gone upon seniority when practicable and warrantable.

7485. In the case of officers who were reduced lately at the end of the war, in consequence of their being the juniors of their rank, by what rule do you take them on again to full-pay?—By the total length of their service.

7486. (*Sir T. Phillips.*) Is any record kept, when the exigencies of the service require a departure from any regulation, of the circumstances that have led to that departure?—Yes; in my office I can tell you what led me to pass over a man.

7487. Is it a record made at the time, and stating the grounds upon which one man had been passed over, and another had been preferred?—I do not know that there is a specific record, but the books of the office show it.

7488. (*President.*) In your recommendation to the Commander-in-Chief, in case of selection, you do not give the reasons?—No.

7489. You do not do as the Commander-in-Chief does when he promotes a colonel to the rank of a general officer out of his turn; he states the reasons in the Gazette?—I am not compelled to do so; but I think I have on one or two occasions stated that the officer recommended was a particularly eligible officer. In the case of Dr. Gordon, who was selected for China, he was not the senior on half-pay, hence in that case I recommended him on account of his merits.

7490. He is a very skilful operator, is he not?—Yes; but that is not his only recommendation.

7491. (*Sir T. Phillips.*) "Particularly eligible" would convey no information to anybody, unless the real grounds of a man's merits were recorded?—I did nothing of that kind.

7492. (*Sir J. Clark.*) Among officers of the same rank, if you were called upon to send out an officer—say to China—would you feel yourself quite at liberty to select a man that you thought the fittest, without regard to seniority?—I would.

7493. (*President.*) You would, under no circumstances, allow anything but your knowledge of an officer to influence you—you would not take seniority into consideration where you were selecting an officer for the command of an important expedition?—Most undoubtedly not.

7494. With regard to officers who have been reduced, by what rule do you call them back again to full-pay?—By the total length of their service.

7495. But do you reduce them by the same rule?—Yes.

7496. You reduce the juniors of each rank, do you not?—No.

7497. Suppose the case of a newly-promoted officer who had very long service in his previous ranks, and was the last man promoted, would you continue him on full-pay, and reduce his two or three juniors, and so have less total service in the junior ranks?—Yes, that is my idea of justice; and I spoke to Lord Panmure upon the subject, who also seemed to see that it was a case of justice, as many men had been promoted when they ought not to have been, had other officers been on the spot who could have been promoted.

7498. If a man is promoted for merit he loses the advantages of his merit if there is a man immediately below him, and who has been promoted possibly from seniority after very long and distinguished service?—No; in that case there would have to be a discretion exercised. I should make that a special case, and make a special representation.

7499. The rule would not hold there?—No; it will not hold invariably in all cases, and I do not think it is possible to make a rule so fixed and definite as that it will work throughout the whole of the British army.

7500. (*Sir T. Phillips.*) It would seem to follow that there must be selection of an undefined character?—There must be; and I do not see how it can be avoided, unless some people can see further than I can.

7501. (*President.*) The rule should be seniority?—Yes.

7502. And the exceptions should be selection undefined?—I think so.

7503. (*Mr. A. S. Stafford.*) Is not that practically altogether selection, and is it not a delusion to talk of seniority?—No; because nine-tenths are promoted by seniority, and if every man is to be promoted by seniority, save when it cannot be exercised, then selections become the exception.

7504. (*President.*) Take the case of Dr. Beatson, he was reduced to half-pay, and two officers have been put on full-pay before him, Mr. Wood and Mr. Paynter?—No; they were on full-pay. It will be necessary to explain that when the medical officers, the staff surgeons of the first class, came home from the Crimea, it was necessary after the establishment was fixed to reduce a very considerable number, and the rule, as I have mentioned, was to reduce them according to their length of service, and not according to their standing in the grade, and in order to do justice to those who had not been promoted so soon as they would have been had they been available. When 15 or 16 staff surgeons of the first class arrived from the east, there were two junior staff surgeons of the first class who had been employed for some time at home, one had been for six or seven months at Portsmouth, and the other had been about the same time at Aldershot, but these were only for temporary duty, and

were not to be continued after the reductions took place, therefore I considered it would be quite unfair to the service to take a man coming from the Crimea, who was totally ignorant of the duties to be performed in the garrison at Portsmouth, and which were very arduous and difficult duties, such as disembarking the sick and wounded, and also superintending, as far as medical matters were concerned, the disembarkation of the troops. I believe Mr. Wood was junior to many, but as it was only for a few months, as I expected, I thought it would not be just to remove him from a place where he understood the duties, and put a man there who would have to learn his duty, and therefore, as both Mr. Wood and the other man would require to be reduced in a few months, I thought it better to reduce even the seniors to Mr. Wood first, rather than to make any change.

7505. Therefore again that comes to be selection?—Yes, but selection made for the good of the service, there is no question about it; but I felt that I was doing no injustice to the others.

7506. In the case of Mr. Wood, as I understand you, he was not reduced before Dr. Beatson on that ground?—Yes.

7507. He has been now restored to full-pay, has he not?—No; when he was no longer required at Portsmouth I received an application from the principal medical officer at Fort Pitt to say that the number of men to be discharged from the service who were coming there was so great that it would be impossible for him individually to get through the whole of the invaliding, and that he wanted a staff surgeon temporarily to assist him, and in consequence I moved Mr. Wood to Chatham and he was there a month, and when the duties were completed I contemplated at the end of the month putting him on half-pay. Two staff surgeons were required to go to China, and as I thought they would not be long abroad, I sent Mr. Wood to do the duty of one of those men with the expectation that they would soon be back and he would then return to his station, and Mr. Wood would be placed on half-pay. That having happened, there have been two or three circumstances that have given the semblance of injustice to this case; but Mr. Wood is now going to be placed on half-pay, as I see no prospect of a senior staff surgeon coming back soon, and the two senior staff surgeons in the service are going to be restored to full-pay.

7508. Who are those?—Dr. Fox and Dr. Robertson.

7509. They are senior to Dr. Beatson?—Yes, they are senior to him; I wish to state the complications and inconveniences which will arise in consequence of the step I have found it necessary to take, and which I did not resolve to take till after full consideration. The constant remonstrances of Dr. Beatson led me to recommend that Mr. Wood and Mr. Paynter be at once placed on half-pay, and that Dr. Fox and Dr. Robertson be recalled to full pay to replace them. The necessity for the services of these two officers will cease when the two staff surgeons now in China shall return, and then it will become again necessary for two to be placed on half-pay. The changes thus to be made will in no way conduce to the benefit of Dr. Beatson, as there are many on half-pay who must be restored to full pay before he can.

7510. I want to know what is the rule by which you are governed; in this case, as in others, the rule is selection, but the exceptions are so frequent that, if they are not acknowledged, they shake confidence in the rule?—They are perfectly acknowledged so far as the medical officers are aware of them; Dr. Beatson was told over and over again why I kept Mr. Wood; but these cases are exceedingly rare.

7511. But still they exist?—Yes; and in my opinion, from my experience, it will never be possible that they should not occasionally occur.

7512. (Mr. A. S. Stafford.) In what way can you deal with a medical officer who misconducts himself, what degree of punishment can you inflict?—I can

inflict no punishment but a reprimand, unless an officer has acted so badly as to justify his being brought to a court-martial.

7513. (Sir H. K. Storks.) Can you remove him from one station to another?—I could do that, but I have never done it, and besides, the government would not allow me to incur the expense of his passage, and the passage of a man back to his place.

7514. (Sir T. Phillips.) Is the officer's promotion stopped?—I cannot stop his promotion unless by a court-martial.

7515. So that, however great may be the demerits of a man, he must go up?—No, I can pass him over.

7516. Do you do so?—I have done it in some instances, and I am prepared to justify myself.

7517. Is there any record kept of the reason which induced you to pass any man by?—Yes.

7518. (Mr. J. R. Martin.) Can there be any more legitimate ground for promotion than active field duties well performed, even though the officer came accidentally to discharge them?—No; but I think it would be unjust to others to promote him over them.

7519. But there must be some accidents in every public service?—The object is to do as little injustice as possible, if you have the means of acting justly.

7520. Suppose a combatant officer distinguishes himself in the field, and he is rewarded for it, you would not think it necessary, I presume, because some other man might have equally distinguished himself, to place him on an equal footing with the other officer?—No; every regiment is in a circle, and the promotion goes on in that circle.

7521. Take the case of a staff officer who has distinguished himself in the field, and receives his reward; another man would have distinguished himself equally if he had had the opportunity; how are you to put those two men on an equal footing afterwards?—I do not know; a general officer has the power of selecting his own staff, and extending to that staff all the advantages which the situation offers them. I have the power of selecting medical officers, and I can extend to them all the advantages which can be legitimately extended to them.

7522. (Sir H. K. Storks.) Suppose you find an incompetent officer, what do you do with him?—I can do nothing with him but try to get him put on half-pay. I can only tell a colonel, if he sees that a man is irregular in his habits, you must find the means of bringing that man to a court-martial.

7523. (President.) You cannot try a man by court-martial for professional incompetency?—I could do it, but I know he would be acquitted, and therefore I would never attempt to do it unless the case was exceedingly gross.

7524. (Mr. J. R. Martin.) Should not any such court-martial be always composed of a portion of medical officers as well as military officers?—Certainly; I should say so, but the rules of the service do not admit of it.

7525. (Sir T. Phillips.) Are medical officers ever tried by court-martial?—Yes; a charge of neglect of duty was brought against a man during the time of the cholera; he was partly afraid of the disease, and partly neglected his patients, but he was acquitted.

7526. But that is extremely rare, is it not?—Yes. When a medical man is warned by me that he must stand a court-martial if he does not resign, he is generally aware of the danger he stands in, and he generally resigns.

7527. (Mr. J. R. Martin.) In every case of a trial of a medical officer by a court-martial do you think there should be on the court a certain portion of medical officers?—Yes, if it is for professional reasons; but I have that high opinion of our military officers that I would go before them to-morrow without a single medical officer. In professional matters I think there ought to be medical officers on the court.

Dr. A. Smith.

6 July 1857.

Dr. A. Smith.

6 July 1857.

7528. (*Mr. A. S. Stafford.*) Have there been instances of medical officers resigning rather than stand a court-martial, and subsequently being restored to the service?—None, that I am aware of. There is a rule which we generally observe, and that is, never to restore a person who has resigned.

7529. (*Sir H. K. Storks.*) But a man may have resigned for private reasons, and not from any misconduct?—Then you do not restore him to the same rank.

7530. (*Mr. A. S. Stafford.*) Can you say that there have been no army medical officers who have resigned to avoid a court-martial and whose names are not now in the Army List?—Not in my time; I do not think there are any men in the service now who had been threatened by court-martial and who had resigned, and have afterwards been reinstated.

7531. (*Sir J. Clark.*) Do you make any distinction between a person who retires from the army on account of private affairs and one who retires to avoid the consequence of a court-martial?—Yes. If a man retired for his private affairs I should object to his restoration to the service, but I might be overruled, as happened some time ago in the case of a man of the name of Macpherson who retired to some occupation in the Isle of France; he failed there, and he applied to be restored to the service; the case was put before me in this way, you want medical officers and you cannot get them, why not agree at once to the restoration of this man. That had a certain weight with me, and I did not raise any further objections. Before the war he had repeatedly applied, and I always raised the objection I thought that it was unjust to the officers serving to let a man go off for six or eight years, and then come back again and take his standing in the department.

7532. (*Sir H. K. Storks.*) Was he restored?—Yes.

7533. Is he now in the service?—He is now on half-pay.

7534. Is he now on the permanent half-pay list?—He is on half-pay, something very small.

7535. Supposing that man is not brought in again, is he eligible to be brought in again?—Yes. I do not see any reason why he is not when it comes to his turn. He goes to the bottom of his list; he loses all his previous service.

7536. Mr. Macpherson's is a *bonâ fide* restoration to the service?—Yes, and to the rank which he held in the service; but he has only one year's service in that rank instead of, I think, eight or ten, and therefore he is junior to all the other surgeons.

7537. He is only on temporary half-pay?—I cannot exactly answer that question. I think he has very diminished half-pay, not temporary half-pay. I suppose if I do not bring him in when all others have been brought in to full-pay, I shall have a letter from the War Office to ask me whether I am not doing it.

7538. (*President.*) Will you state the grounds on which you take a man by selection?—The grounds are, his superior efficiency.

7539. How is this superior efficiency ascertained?—By confidential reports, and my general knowledge of all the individuals—these are the only grounds.

7540. (*Sir T. Phillips.*) Is there any limitation to your discretion as to the time of service. Might you say, "I will take a man who has served five years for great merit, and promote him to the rank of surgeon"?—I could not do that. I can only promote by seniority to the rank of surgeon.

7541. Take a surgeon of the second class, what limit is there to your selection in that case other than your own judgment of the man's merits?—There is no fixed limit.

7542. You might promote a man who had served one year as a staff surgeon, and make him a surgeon of the first class?—No; because he must have served either three years abroad or five years at home, before he can be promoted as staff surgeon of the first class.

7543. He must have served in the second class for five or three years before he can be promoted to the first class?—Yes.

7544. Is that rule published?—Yes. There is a limit, as shown by the warrant at page 48 of the Regulations, "No medical candidate who has not passed his examinations at the Royal College of Surgeons of London, Edinburgh, or Dublin, shall be eligible for the commission of assistant-surgeon, and he must have served as such on full-pay five years, before he shall be eligible for promotion to the rank of staff surgeon of the second class. Staff surgeons of the second class must have served 10 years in the army on full-pay, before they shall be eligible for the next step of rank."

7545. No merit would enable you to dispense with those conditions?—Yes; if I went forward and submitted that a man was so meritorious that an immediate step of promotion should be given, I might be able to induce the Minister for War to ask the sanction of Her Majesty to suspend the warrant in that case.

7546. It would be by special warrant?—Yes.

7547. Supposing that you were to select a person for his merits, would you record at the time, in some document open in the department, the grounds upon which you had selected him and passed by his neighbour?—Most decidedly not. You would have a state of dissatisfaction most injurious.

7548. In fact the reasons for your selection are confined to your own breast?—Yes, and the confidential reports, which of course give me information.

7549. Those reasons which have induced you are confined to yourself?—Yes, only in this way, that if you were the person passed over, I would tell you why.

7550. There would be no record of the reasons which had influenced your judgment?—The record would be the statement contained in the office.

7551. (*President.*) There would not be an entry in any book, "So and so promoted on the recommendation of Dr. Smith, on such and such grounds"?—No.

7552. (*Sir T. Phillips.*) You would not have something like this? "Having considered such and such documents, and being aware of the merits of A. B. in such and such respects, I do recommend him for promotion now"?—Nothing whatever.

7553. (*President.*) Your recommendation to the Commander-in-Chief is simply a recommendation of promotion without any reasons assigned?—Not invariably. Occasionally reasons are assigned; but, generally speaking, not.

7554. (*Sir H. K. Storks.*) It is a matter of favour to the individual, if you explain to him the reasons?—No.

7555. (*President.*) Do the officers who are reduced have the same rate of half-pay as the others?—No; they have somewhat more than the others who are not reduced.

7556. You have told us what are the rates of pay of officers now reduced, and what you think they ought to receive with regard to the scale of retiring allowances; you propose to alter that scale likewise, do you not?—Yes.

7557. Do you intend to alter the half-pay?—Yes; but none are allowed to go permanently on half-pay until they have completed a certain period of service. It is 25 and 30 years at present. I propose that the lower half-pay should now be after 20 years of service, and the higher after 25, instead of 25 and 30. Unless from ill health they shall receive after 25 years, seven-tenths of their pay. In the case of sickness, when a man is placed on half-pay, and it is in that case only that he is placed on half-pay, or even permitted to go on half-pay, I propose, as he requires some assistance beyond what he would receive from his half-pay, to increase it to three-fourths.

7558. Is there a material alteration in the relative value of the half-pay and your new rates of full-pay, as compared with the old ones?—There is, as nearly as possible, the same relative value. It is rather in favour of the new scale, because it was necessary to do that.

7559. Do you consider that at present, irrespective of the amount, the rate of half-pay is fair enough, in proportion to the full-pay?—If you reduce the period of service it is large enough; but not if you make men serve 25 or 30 years. With reference to what I mentioned before, as to the allowance of half-pay given to officers compelled from sickness contracted in the public service to go on half-pay, I propose, instead of their having the ordinary rate of half-pay, which is lower than the rate on reduction, that they should have three-fourths of their full pay at the time, whether from reduction of the establishment, or from sickness.

7560. You make no other change then?—No.

7561. You propose no other scale of half-pay?—No.

7562. With regard to retired pay, you have no half-pay in the medical department?—No.

7563. You have a reduced pay on retirement?—Yes.

7564. What alterations do you propose to make in the retired rates?—I will put them in. (*See App. No. X. (2).*)

7565. Do you intend any part of that retirement to be compulsory?—Yes, I think it ought to be compulsory.

7566. At what age?—At 50 for surgeons.

7567. (*Mr. A. S. Stafford.*) Will you state the time of life, or period of service, after which a man should retire?—The time of life (for a man may enter at a very late period of life, if we go on with the competitive examinations which we have) I should fix at 50.

7568. Will you always get their certificate of age correctly?—Yes.

7569. (*President.*) Have you a maximum age under your competitive system?—Yes; but I suspect we must give way in that. The East India Company do not fix so low an age, but take the best men, limiting them to 28, ours is 25.

7570. Therefore their limit is three years longer than ours?—Yes.

7571. The mortality among officers of the medical department is high, is it not?—It is not universally very high. It is high amongst the juniors, but not amongst the seniors.

7572. Do you intend to give different rates of retirement to different ranks?—Yes; seven tenths for those above 25, and five-tenths for those below 25 years service upon the pay of the rank from which they retire.

7573. So that then rank will have a very great advantage?—Of course.

7574. Therefore that would be conducted upon a different system from that which now obtains. You count seniority of service rather than seniority in the rank, in giving promotion and in making reductions?—No; they are both upon length of service; but retired pay must depend on rank.

7575. But it is to be a mixed principle, partly for length of service and partly for rank, upon which they shall earn retirement?—Yes. If a man is deputy inspector he retires immediately after 20 years of service, on five-tenths of his pay; and if he has served 25 years on seven-tenths of his pay.

7576. Do you know at all the value of the allowances as it would be calculated in an insurance office?—No.

7577. (*Sir T. Phillips.*) Are the Commissioners to understand you to say that you would make it compulsory upon a staff surgeon of the first class to retire at 50 years of age?—No; he is an administrative officer.

7578. (*President.*) You propose compulsory retirement in the upper ranks likewise, do you not?—Yes.

7579. At what age?—60 or 65 for the whole.

7580. How would you count a first class staff surgeon?—65 being an administrative officer.

7581. There is a new pension warrant by which the amount of pension given to an inspector-general is less than that given to a commissary-general?—It is less by 50*l.* a year, I think.

7582. Does the same difference pervade all the ranks, both in the commissariat and the medical service?—Yes. The commissary-general gets 350*l.* Then, as to the deputy inspectors, the deputy commissary-general at the head of a department gets the same pension as an inspector-general, though he is a rank below him. He gets 300*l.*, the same as the inspector-general gets.

7583. By the same warrant a change is made by which a medical officer, take a deputy inspector for example, would not have the same relative rank as now he possesses; he ranks with a major not in command, does he not?—A colonel or a lieutenant-colonel, an inspector-general of hospitals who ranks as a brigadier-general, all get the same rate of pension, which is quite incongruous. A deputy-inspector of hospitals gets the pension of a major not in command, though he has the relative rank of lieutenant colonel.

7584. (*Mr. J. R. Martin.*) Has any change taken place recently in the pensions granted to the widows of medical officers?—Yes, about two years ago, during the war. I recommended that medical officers' widows should be entitled to the same scale of pension as military officers' widows were. Previously to that they had a much lower rate of pension.

7585. Lower than the widows of paymasters and quartermasters?—No; because paymasters take the pension according to their rank; but medical officers' widows got a much lower rate of pension than military officers' widows.

7586. Is the change satisfactory?—Yes.

7587. (*President.*) You propose that in future officers retiring from sickness shall be put on the reduced rate of half-pay?—Yes; they require that little assistance.

7588. You think that the present system is a hardship?—Yes, I think so.

7589. Are there any other grounds of complaint that you wish to advance?—Yes. There are a great many disadvantages to which medical officers are subject, all of which I have stated to Lord Panmure.

7590. You do not wish to make any addition to or qualification of any of those statements?—No. It may occur in taking evidence that some one will see some additional matter to suggest that did not occur to me at that time or now. I think I suggested all that I thought desirable.

7591. As regards relative rank you wish the officers to take rank according to the date of their commissions?—Yes, but that they shall rise after a certain number of years; that a regimental surgeon, after a certain number of years' service as such, shall get the rank of major, and so on throughout all the other ranks; that a deputy inspector, after serving in the rank for a certain number of years, shall get an increase of rank, and an inspector the same.

7592. Do you propose that they should serve in courts-martial according to their rank?—I think either that they ought to serve on courts-martial according to their rank, or that they ought never to be employed on courts-martial. I hold that it is a most invidious and most unpleasant position to be placed in. I do not think that there is one hardship that a senior medical officer has to complain of more than that he has to sit as junior to an ensign on a court-martial.

7593. Is there any change that you propose as to the relative rank of medical officers?—I have proposed a change throughout.

Dr. A. Smith.

6 July 1857.

Dr. A. Smith.

6 July 1857.

7594. Do you propose not merely that the nominal rank should be changed, but that an officer should really rank according to his relative rank?—A medical officer never can have command, it would not be consistent nor to the good of the service that he should have it. In my opinion he must always only have relative rank.

7595. (*Mr. J. R. Martin.*) Would you call his position on a board relative?—No; there he should take rank according to service.

7596. (*President.*) Would you make him the president?—Yes.

7597. Would you make him president upon a court-martial to try a combatant officer?—I do not see why not. A medical officer who has served a long time in the army knows almost every intricacy connected with the army just as well as a military officer; therefore I do not see that a medical officer would not make himself equally competent if he knew that he was liable to be called upon in that way.

7598. (*Mr. J. R. Martin.*) Do not you think that the relative rank should be made substantive, and not nominal?—I do not understand how that could be done.

7599. For position, for quarters, for prize money; that if an inspector-general has a certain corresponding co-ordinate rank in the army, he should have all the privileges appertaining to that rank?—I understand that relative rank should give him all those privileges. In my relative rank of major-general I should get all the allowances of a major general if I was in garrison.

7600. Did you hear of the case of Dr. Donald Macleod, the inspector-general of Her Majesty's hospital at Madras, who, on the occasion of a committee of inquiry into some civil matter, was placed under a captain of the Madras army, he having the rank of brigadier-general; in that case what was the use of his holding the corresponding rank?—Because that is a special regulation that applies in India, and also in England. I have had to sit as a member of a board in condemning old blankets and things of that sort, a captain of the garrison being the president. I objected to it at the time. I said that I did not think it was right, for I ought more properly to have been president, as I knew more about blankets than he did.

7601. (*President.*) Have you any proposal to make with regard to the uniform?—The uniform has lately been changed.

7602. (*Sir H. K. Storks.*) Has the uniform of the medical clerks and people of that sort been changed?—A uniform was established for a time when they were at Scutari.

7603. (*Mr. J. R. Martin.*) Has the uniform given satisfaction?—As far as I know it has given satisfaction; perhaps not at the time, for a number of ornaments were taken away, and perhaps they did not like it.

7604. Did you hear the reasons assigned by Lord Gough for having, on the committee that we have spoken of, superseded an old surgeon of the Indian army by a young captain, the surgeon ranking with a major?—I did not.

7605. The reason assigned was that all medical rank was official; does that convey to your mind any satisfactory reason?—Certainly not.

7606. Was not the rank of the Commander-in-Chief himself official, and did it not cease with his departure from India?—I should think so. I will now hand in this memorandum.

7607. (*President.*) The uniform of a medical officer ought clearly to show who he is?—Yes, I think so. I think there is one distinction at all times which conveys that, namely, the want of a sash. In all other respects I think the uniform might be alike. They do not wear a sash, but a black belt and a black plume.

7608. (*Mr. J. R. Martin.*) Might not that distinction of theirs render them liable to be hit in action

by making them conspicuous?—No, I do not think so. The distinction is too small, you must have a distinction. You must have some means of knowing a medical officer from other officers.

7609. (*President.*) A complaint is made that the similarity of the forage cap to that of the commissariat officers produces mistakes among the men, who appeal to the commissariat officers for surgical assistance?—I do not know the commissariat forage cap, therefore I cannot say.

7610. All that you wish is that the uniform should clearly convey the professional position of the officer who wears it?—No, more than that. Medical officers ought not to be degraded as they were before the new dress was drawn up. I drew it up myself and it was sanctioned by Lord Hardinge. I secured as great a similarity in the dress for the medical officer as I thought could fairly be done with a due regard to the interests of the public service. In my recommendation I put in for the senior medical officer of a department a brass scabbard; that is not printed in the regulations, but I believe that was accidental. No objection is ever raised to the senior medical officer of a department wearing a brass scabbard.

7611. (*Mr. T. Alexander.*) Are you aware of a first-class staff surgeon, ranking as a field officer, having been found fault with and desired to lay aside the brass scabbard?—I am not.

7612. (*Mr. J. R. Martin.*) Have you heard any objection to the black belt as being disparaging to a medical officer?—Yes; I have heard individuals object to it, but I have heard individuals object to any difference whatever.

7613. (*President.*) The man who wants to be assimilated to a combatant officer is a man who is ashamed of his profession, and if he is, he is not fit to be in it?—Just so.

7614. (*Mr. T. Alexander.*) Would you not recommend a brass scabbard for a first-class staff surgeon instead of a black one?—Yes, that was approved by Lord Hardinge; I saw the approval myself; I think there has been some mistake in the printing.

7615. (*President.*) In your recommendations which you put in, do you include anything with regard to rewards and promotion for service in the field?—Yes.

7616. Do you consider service in general hospitals to be of so oppressive a kind that it ought to be placed on the same footing as service in the field?—It ought to be placed on the same footing.

7617. It has been held that the medical officers at Scutari are not entitled, they not having been in the field?—I look upon the men employed in the hospitals at Scutari to have been as much in danger of their lives as the men in the field.

7618. Was not the mortality among them greater than among the men in service in the front?—Yes.

7619. (*Mr. A. S. Stafford.*) It would be a great discouragement to men who were so placed in future?—Yes; it will make them avoid being placed there if they can; they constantly want to get to the field; there were constant demands to Sir John Hall to let them come up to the field.

7620. (*President.*) It is advisable, is it not, to give additional pay for additional time on service in bad climates?—I do not think it is advisable, for every man is liable in his turn to that.

7621. You stated the other day that the inspectors who inspect have instructions which are lithographed?—Yes.

7622. They are not published in any warrant?—No.

7623. Ought they not to be published, so that the officers who are inspected should know the rules by which the inspectors conduct their duty?—They might be; it is not the practice in the military branch.

7624. Could you put the instruction in?—Yes, I can.

7625. Can you put in all the forms of returns which are used by the medical officers, and which they send home?—Yes.

7626. With regard to confidential reports, Sir J. Hall stated the other day that they are not confidential, and that, so far as he is concerned, he makes it a rule always to impart the substance of them to the medical officers against whom they are made?—Yes.

7627. Do you think that that is a good rule?—I think so; I think that they are not intended to be so purely confidential as not to be made known; I should have no hesitation in making any communication to an officer if he asked for it; when anything unfavourable reaches me I generally write the officer a letter, telling him what must be the consequence of his persevering in his line of conduct. I send that under cover to the principal medical officer to send to him; I do not think that in one case out of fifty a man ever asks me why he is found fault with, because he always knows it.

7628. (*Mr. J. R. Martin.*) Would it not be satisfactory to the medical officers that the confidential reports should be on the same footing as those with respect to combatant officers?—They are exactly so; perhaps there is even more communication made by me to the officer accused.

7629. (*President.*) It being the custom at the Horse Guards always to communicate to an officer the substance of any confidential report made against him, do not you think it would be advisable to take the same course with regard to medical officers?—I do so. I think there must be some error in the print; Sir George Wetherall must have misunderstood the question; I have never known it to be the case during my service that military officers were informed specially of what they were accused of; they may be informed in general terms that the General in command does not approve of their conduct.

7630. (*Mr. J. R. Martin.*) The difference would appear to be that in the one case the officer is informed, and in the other case you wait until the officer asks to be informed?—No, I do not wait until he asks; when a statement is made against him I let him know that he has been unfavourably reported upon; I do that as a matter of course to every officer; I write a letter and I send it through the principal medical officer to forward to him if he is at a foreign station. If it is of such importance as that I think the department ought to know of it, I require him not only to call the medical officer who has been guilty into his office, but to assemble the whole of the medical officers to listen to the letter.

7631. Is it optional with you to do that?—Yes.

7632. It is not a fixed rule of the service?—No.

7633. (*President.*) You state in your evidence before the select committee on the Army Medical Department, in answer to question 183, "I generally make a habit, if an officer complains who has certain statements against him, to tell him that he has those statements against him; I do not like to conceal it from the officer." That implies that you have not originally told him when the complaint is made?—I tell him in general terms that he is complained of, and that if he perseveres it must be to his detriment; and if he professes not to know what he has done wrong, and asks me, I then tell him.

7634. Then you say, "Unless he was to press me very hard to know what they were, I should not tell him the exact things; but at the same time I would not object, if he pressed hard, to tell him the exact things?"—Yes; it is a thing understood—a sort of freemasonry in the service—that you are not to expose the principal medical officer to imputations, for then they would not give you reliable reports at all.

7635. (*Mr. A. S. Stafford.*) In question 3267, before the same committee, Sir George Wetherall is asked, "Do confidential reports go to the adjutant-general?" to which he replies, "Always." He is then asked, "And is it the usual practice, if in those

"confidential reports anything injurious to an officer is mentioned, to inform the officer so complained of that he has been reported against?" and his answer is, "Certainly, through his commanding officer." "Is that practice invariably followed?"—"I should think so. Ever since I have been in the office the invariable practice has been that the commanding officer should be written to, stating what the general has said; but all such reports connected with medical officers are immediately sent to the director-general for him to deal with as he thinks proper." Then at question 342 you are asked, "With respect to the confidential reports, of which you spoke in your former examination, are you able to state any differences which exist between the confidential reports made to you and the confidential reports made with regard to the competency of officers to the War Office?"—"I cannot say that I know what the confidential reports are which are made to the War Office." Question 343. "Do you ever communicate to the individual implicated the confidential reports made to you?"—"No, I do not as a rule. As I stated on Thursday, if an officer was to complain to me that he was suffering seriously, in consequence of some reason or other, in a way that he did not think he deserved to suffer, and if he claimed consideration or advancement, I would consider it then my duty to tell him why he was suffering. But I do not make it a rule to communicate the confidential reports." Question 344. "In short, you make it a rule not to communicate them?"—"I do it only as an exception." Do you still adhere to this statement?—I still state what I stated here in the very first answer that I gave. Suppose the principal medical officer at the Cape reports unfavourably to me of another. I immediately address a letter to the officer in general terms. I do not say, you have not been attending your hospital regularly, or doing something improper in the barracks; I tell him that his conduct has been unfavourably reported upon, and that if he does not change the consequences will be serious.

7636. (*President.*) Do you not give the substance of the complaint. If a man was reported for some bad medical treatment, or if he was reported for inattention to his duties, want of zeal, or absence, would you not specify that it was for neglect of his duties or that it was for incompetent treatment?—I should not. I would send to the principal medical officer, and leave it for him to send for the man and give him my letter, expressive of what the consequences will be if his conduct is persevered in.

7637. Would you make it a matter of instruction to the reporting officer always when he makes a confidential report to communicate to the officer reported against that that report is made, after the manner of Sir John Hall?—The only fear is this; there are some principal medical officers so weak, and so desirous of standing well with those serving under them, that I am afraid if that was required they would not report unfavourably if they had to show their report to the officers. Sir John Hall would not feel that, but others would, and we should not know so well as we do the characters of the medical men in the army.

7638. (*Mr. J. R. Martin.*) Should not this question be settled by well-understood regulations?—I have no objection to that; I only state that I anticipate danger from settling it by regulation.

7639. (*President.*) Do you find the confidential reports that come home vary?—Very much.

7640. They vary not so much from the different conduct of the men offending, but from the different way in which the reports are made?—Yes.

7641. (*Mr. A. S. Stafford.*) Does not this place the medical officers in a position in which no other officers are placed, that of not knowing what the charges are which may silently operate against them, and which they never know or hear of?—They do know.

7642. (*President.*) Not as a matter of course, the information is not given whether an officer applies or not?—No, but he is informed that complaints have

Dr. A. Smith.

6 July 1857.

Dr. A. Smith.

6 July 1857.

been made against him, and I almost always find he knows what they are.

7643. It is given to a man who happens to be in England, but it is denied to a man who is abroad?—No, he would get it if he were to apply for it. Every man knows that there are confidential reports every year coming in.

7644. (*Mr. A. S. Stafford.*) He may not know that they are adverse to him?—No; nor will any military officer know that.

7645. (*President.*) Have you observed what Dr. Burrell says upon that subject? He says, "I do not disapprove of them (that is, of the confidential reports), provided they are not done in secret; that is to say, if an officer is disapproved of by the principal medical officer at the station, he should know that he is found fault with." Then he is asked, "Then what becomes of the word 'confidential,' if that is the case?" To which he replies, "It should be confidential; but at the same time it appears to me that an officer should certainly not be reported unless he has been found fault with. You may not exactly tell him the express words in which you report him; but, if an officer has neglected his duty, he certainly ought to be told of it by the principal medical officer of the station, otherwise he should not be reported"?—I do not suppose that that ever happened. No principal medical officer has ever reported, I think, a man whom he has not found fault with when he was doing wrong.

7646. Have there never been instances in which confidential reports have subsequently been disproved?—I know of none. I have now a correspondence going on in which an assistant-surgeon complained to me. I communicated to him that he had been most unfavourably reported upon from the West Indies, and that if he persevered in his course of conduct it must act detrimentally to his advancement in the service. He denied that he had done anything; and he asked what he was accused of; and I sent him a statement of what he was accused of. I also sent to the officer who reported him, and I have sent out now to the principal medical officer his reply. I always have sent to the person who reported him the officer's reply.

7647. (*Sir H. K. Storks.*) Do you ever see the confidential reports as to medical officers that are sent in at the half-yearly inspections?—Yes.

7648. (*President.*) Do you agree with Dr. Burrell that it is "most unfair if an officer who has neglected his duty is not told of it, but is confidentially reported upon unfavourably, and this is brought against him 10 or 12 years afterwards, and his promotion is stopped in consequence, and probably he does not know how, or on what station?"—It is decidedly unfair.

7649. (*Mr. A. S. Stafford.*) But that must happen?—I do not admit it. What I say is, that I write to the officer who has been doing anything wrong, and I send the letter to the principal medical officer on the station, to require him to explain to that officer what must be the consequences of his proceeding in that way. If he goes on doing his duty afterwards satisfactorily, a report made 20 years ago will not have any effect upon him when he is eligible to be promoted.

7650. Dr. Mapleton says, "If the confidential reports go to the extent of stopping a military man's promotion, that is not done without the military officer being made acquainted with the nature of the reports against him ordinarily; whereas, if a medical officer has a confidential report against him, he knows nothing about it, but he finds that he is not promoted, and he does not know the reason." Surely it is very unjust to stop a man's promotion and damn him for ever without giving him an opportunity for explanation?—I ask facts; to show such is ever done.

7651. (*Sir H. K. Storks.*) Suppose an officer is reported to you as incompetent, and betraying ignorance of his professional duties, do you communicate

that to him?—Yes, and I recommend steps to be taken in such a case.

7652. But you say that you cannot remove him for it?—No; I can recommend an investigation. There was a case of that kind in Canada. An officer was reported as physically and mentally incompetent for a medical officer. I had an inquiry made there, and the result was unfavourable to him, proving that he really was as had been alleged. I endeavoured to get him placed on half-pay, and after a long correspondence I succeeded.

7653. How long had he been in the service?—20 years. He was a surgeon.

7654. (*Sir J. Clark.*) He had become ill in the service?—I do not know that. As far as regards his mind I suspect it was always weak, but as regards the body, he became ill in the service.

7655. (*President.*) Sir John Hall stated that he made no confidential reports while he was in the Crimea; was he in error?—He was right as far as regarded general confidential reports. It was impossible to make confidential reports of 600 or 700 men, and he had comparatively little opportunity of judging of every man. To make confidential reports a man must have some personal knowledge of the men. He simply reported as to a certain number; the best men he reported upon and recommended them for consideration, and some bad men he also reported upon, but he did not make one general report.

7656. (*Sir H. K. Storks.*) He reported upon the good or bad men that fell under his observation?—Yes.

7657. (*President.*) How is the medical examination for recruits conducted?—after certain preliminaries have been gone through, and the military authorities see no objection to accepting a man as a recruit, provided he is physically fit, he is sent to the inspecting medical officer.

7658. Are there any rules for medical inspection?—Yes.

7659. Are they old or modern rules?—Their date is 1845.

7660. Is there any examination standard for the admission of recruits other than the standard of height?—Yes, there is; physical power; every part of a man's body must be proportionate to constitute a good soldier.

7661. Is the man's depth of chest measured as well as his height?—Yes, the size round the chest.

7662. Is he tried by the stethoscope?—Not unless there is any particular reason for doing it. If there is any suspicion of pulmonary disease it is done.

7663. (*Mr. A. S. Stafford.*) Is there any punishment for passing recruits as sound that ought not to be passed?—Nothing but a censure. At one time there was a punishment. They used to make the medical officer pay all the expenses, but that was found to be hard, as it might be a mere error of opinion. It was found that they could not get recruits. No medical officer would pass a man unless he was certain to pass on joining his regiment.

7664. There are two ordeals for every recruit to pass through, are there not?—At one time, after a man was inspected by a staff surgeon of the first class, he was sent to the regiment; and, when he arrived there, the surgeon or assistant surgeon of perhaps four or five years' service, examined him and perhaps found there was some defect which enabled him to reject the recruit notwithstanding a staff surgeon of the first class had approved of him. That being such an inconsistency, I represented to the Commander-in-Chief that I thought it was a great mistake, and was causing great discontent, as the opinion of a staff surgeon of the first class might be overruled by a young assistant-surgeon, and I recommended that the examination by a staff surgeon of the first class should be final. That has been adopted since 1851, and is working very well. Now, when a man joins his regiment there is no appeal, unless he may have contracted some injury during a journey after the

time that he is inspected. If he breaks his leg, and the leg afterwards becomes sound, the man must be admitted, but if the bone get overlapped and the leg shortened he is rejected by the medical officer of the regiment.

7665. May no regimental officer pass a recruit now?—Every regimental officer can pass for his own regiment.

7666. (*Sir H. K. Storks.*) At his own regiment he can reject a recruit admitted at head quarters?—Yes.

7667. (*Mr. J. R. Martin.*) Have you considered the question of reducing any of the grades of the

officers in the medical department?—I do not think they could be reduced.

7668. You think that all the grades that you have now are necessary to the service?—No; the staff surgeon of the first class is necessary, only in this way, that the government would not allow a deputy inspector for every small station where an administrative officer is required.

7669. Do you consider the staff surgeon of the second class a necessary grade?—Yes, for detached hospital duties, where a surgeon is required. He is a surgeon exactly as a regimental surgeon is a surgeon, the one is for staff duties and the other for regimental duties.

Adjourned to Wednesday at One o'clock.

Wednesday, 8th July 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.

T. ALEXANDER, Esq., C.B.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

Dr. GEORGE STEWART BEATSON, examined.

7670. (*President.*) What is your rank?—I am staff surgeon of the first class.

7671. Where have you served?—The first year of my service was at Fort Pitt, Chatham; on 22nd May 1839 I embarked for Ceylon, served on that station till February 1851, when I embarked in charge of invalids for passage to England. Again embarked 20th July 1851 for Madras, to join the 51st regiment, to which I had been appointed surgeon the previous January; joined the 51st at Madras, 28th August, embarked with it for service in Burmah on the 31st of March 1852; present, without a day's absence, with the head quarters of the regiment throughout the whole of thesecond Burmese war; re-embarked for Madras 20th February 1854, on the termination of the war. I then embarked with the head quarters of my regiment, 4th April, and arrived in England on the 2nd August. On the 8th of December, I was promoted to be a staff surgeon of the first class; and immediately after I went to Turkey, and served at Scutari, Smyrna, and Koolalee, till the 8th of October; on that day I embarked for the Crimea, and served there till the 30th June 1856.

7672. Were you chairman of a meeting of medical officers, who sent home a memorial on the status of the medical department?—Yes.

7673. Before going to the question of retirement and promotion, I will put this question: I believe you are in favour, with regard to the education for the medical department, of a medical as well as a surgical diploma being required, also a test of general education; and a competitive examination, practical as well as theoretical, conducted by an independent body?—Yes, I am.

7674. Hygiene to be taught subsequently, in some military hospital?—Yes.

7675. Are you an advocate for compulsory retirement, with a view to promote greater circulation in the ranks of the medical department?—I am, decidedly.

7676. At what age, or after what amount of service, would you make retirement compulsory?—Not later than 35 years' service, or, at all events, at 60 years of age.

7677. Whichever first happened?—Yes; as in the event of an officer having been on half pay he might

be 60 years of age, without being able to complete 35 years service, but he would be old equally the same.

7678. Age having equally disqualified him by infirmity, you would, on the one ground of age, make retirement compulsory?—Yes.

7679. Would you apply the same rule to inspectors and deputy-inspectors?—To all ranks. I hold that for any rule to be just, it must be general. In the East India Company's service the practice to give a pension for service and not for rank obtains in the military as well as in the medical service; it is given for length of service. This practice holds out less inducement for men to remain.

7680. Do you propose that in this case?—I think it is worthy of consideration.

7681. Instead of giving different rates for different ranks?—Yes.

7682. (*Sir J. Clark.*) With regard to age, do you not think that inspectors of hospitals might remain beyond the age of 60?—I think without compulsory retirement at 60 you would keep men so long in the lower grades that you would destroy all healthy stimulus. I will suppose the case of two regimental surgeons, one having served 35 years, and the other 34 years and a half; the moment the one man had completed his 35 years you would require him, if the rule was partial and not general, to go on half pay—in the meantime the other man before he had completed 35 years' service might get a step in promotion, and on that ground, he might go on for 10 or 15 years; I think that the man who was compelled to retire would justly think it neither fair nor just.

7683. (*President.*) If you limited the retirement to the lower ranks, it would be unfair. In the case of a man differing but a few days in service from another, one might come under the rule, and the other escape?—Yes.

7684. Would you not have a lower age by compelling retirement from the executive rank as compared with what you would have from the administrative rank?—Yes; I think after 30 years' service an officer is scarcely fit for executive duties; but instead of forcing him to retire I would rather force the administrative officer of 35 years' service to retire, and give the

Dr. A. Smith.

Dr. George
Stewart
Beatson.

8 July 1857.

executive officer five years of administrative duty, by making a vacancy, and causing promotion.

7685. You would not make all retirement compulsory—you would have it permissive?—Yes, at an earlier period certainly.

7686. (*Mr. A. S. Stafford.*) At what period would you put permissive retirement?—After 20 year's service.

7687. (*President.*) Would you give different rates for 20, 25, and 30 years' service?—Yes; I do not think that the service benefits by an officer retiring after 20 years' service.

7688. If the service does not benefit by his retirement, why should you allow him to retire?—To benefit himself.

7689. (*Mr. A. S. Stafford.*) But would it not be an indirect benefit to the service by inducing a class of men to enter the service who would look forward to retiring after 20 years' service?—Yes; it would thus indirectly benefit the service and the department.

7690. In the meanwhile, if a man was well fitted for the service, it would be a direct loss?—Yes; and on that account I would not hold out any great inducement; I would give him a fair remuneration, but I would give him no great inducement to retire. I think after 25 years' service this view of the subject becomes changed a good deal, and I think after 30 years it is altogether changed, certainly after 35 years I think it would be for the benefit of the service that a man should go.

7691. (*Mr. T. Alexander.*) Do you think many men would retire after 20 years' service?—That would of course depend a good deal upon the amount of remuneration.

7692. (*Mr. J. R. Martin.*) Is it your opinion that a regimental surgeon is the most important medical officer in the army?—Yes.

7693. Do you think that he ought, after three years' service, to have conferred upon him the brevet rank of surgeon major, or earlier than that?—After five years at all events, or after a certain period of service; as promotion varies according to circumstances.

7694. Do you think that that would be gratifying to the feelings of deserving regimental surgeons?—Yes; I know it would.

7695. And that it would be an act of justice in itself?—I think so.

7696. (*President.*) To give brevet rank?—To give a step of rank; after 15 years' service he should not continue to rank as a captain; I think after 15 years service he should have the rank of major, and be styled surgeon-major.

7697. Do you hold that a first-class staff surgeon should have executive or administrative rank?—Executive. I think, as the rule.

7698. What would be the real distinction between his position and that of the second-class staff surgeon or regimental surgeon?—He would be very much like what a surgeon-major in the Guards is.

7699. Would it not be simpler (supposing the rank be not required as an administrative rank) to abolish it altogether, and give to every regimental surgeon and second-class staff surgeon the rank after so many years' service of surgeon-major with some increase of pay?—Yes, and the department would not then lose a grade.

7700. They would get a certain step, assuming the step to go by seniority after so many years' service?—They would have the same number of grades as at present, but they would be differently classed.

7701. Would it not give this advantage, that the director-general, in selecting for deputy-inspectors, would have a wider field from which to select, whereas now he can only select from 40 or 50 men, who are first class staff-surgeons, and then he could select from the whole class of regimental surgeons or staff surgeons, whether they have served the number of years requisite to make them surgeon-majors or not?—Yes; he would have a large field; but I think all the

officers should be of that standing that would give them the grade of surgeon-major, and that the selection should be from that grade, except in very special cases.

7702. Would there be any advantage as removing one of the difficulties attending all promotions to have a step less?—You would not have a step less, but you would have the means of rewarding a regimental surgeon without taking him from his sphere of usefulness, as he might remain with his regiment as surgeon-major.

7703. You do not contemplate the abolition of the rank; all you wish is to make it an executive rank?—Yes, only that the grade should be differently classed—two administrative and three executive, instead of three administrative and two executive, or three as it were to look after two.

7704. If there were three executive ranks, how would you employ them?—I see no reason why they should not be employed as regimental surgeons. At the present time there are several, at least there are three or four, large dépôt battalions in which there are three battalions, and several with two; with those battalions there are three or two second-class staff surgeons, according to the number of the battalions, and I think there would be an advantage in having one of those officers of that higher rank in such dépôt battalions.

7705. His duties there would be partly inspectorial, would they not?—He would be surgeon of the first battalion, and as senior officer he might exercise the same supervision that a surgeon does over his assistant, but he would have his own duties to perform.

7706. If you had a first-class staff surgeon of executive rank, you would not require three second-class staff surgeons?—No, only two in the case of there being three battalions, and one if there were two battalions.

7707. Upon the whole, should you say it would be more advantageous to abolish the rank, merely giving to the regimental surgeon and second class staff surgeon the rank of surgeon-major after so many years' service?—I should not advocate, by abolishing the rank, that those officers who are now first-class staff surgeons should not be eligible for employment; they would then be all of the same rank, and should be just as eligible for employment, and have a preference to juniors.

7708. (*Mr. J. R. Martin.*) The staff surgeon being comparatively a young man, you are afraid that by confining his duties solely to administrative functions, he would lose ground as a professional man?—Certainly; and I think he would lose it very quickly.

7709. Is not that the complaint in respect to all the administrative grades in the service?—Yes; that they cease to be professional men.

7710. (*Mr. T. Alexander.*) Could not a surgeon-major have charge of a recruiting district?—Yes; certainly.

7711. And perform the same duties as a first-class staff surgeon?—Yes; I want to change the designation.

7712. By making first-class staff surgeons surgeon-majors, you would bring immediately on full pay all the first-class staff surgeons, and put them in charge of those battalions, and in districts?—Yes.

7713. If you do away with the first-class staff surgeons, would it not be necessary to increase the number of the inspectorial officers?—Certainly; there are many first-class staff surgeons who are employed in the colonies as principal medical officers, where there must be a superintending officer.

7714. (*President.*) You would have to employ some six or eight additional deputy-inspectors?—Certainly.

7715. (*Mr. T. Alexander.*) And that would induce well qualified candidates to enter the service, as there would be more prizes to be obtained by having more officers of the administrative ranks?—Yes.

7716. (*President.*) With regard to the half-pay, have you any suggestion to make with regard to the

proportion that that ought to bear to the full-pay?—In a case where an officer is reduced to half-pay, I think he ought to receive a much larger proportion than he does at present.

7717. He does receive a larger proportion, does he not, than a man who is reduced on account of ill health?—Yes; a reduction in the establishment always carries with it higher half pay.

7718. But suppose this, which is generally the case, that the government can only meet the financial claim by a compromise more or less; is it not far more important that any addition they can give should be given to the full-pay ranks, rather than to the half-pay?—It might be so, but I think that those officers who have been placed on half-pay by reduction, against their wish, have a claim to consideration.

7719. But their position is only a temporary one?—It is to be hoped it is so, but they may be in that position for many years.

7720. (*Mr. T. Alexander.*) And owing to that uncertainty they cannot turn their attention to anything?—No, they cannot. If a man has completed that period of service when he is entitled to permanent half-pay, I look upon his being placed on half-pay as a very secondary affair.

7721. (*President.*) Did not your committee in the Crimea recommend that in some ranks the half-pay should amount to three-fourths of the full-pay?—I think the committee in London recommended that in the case of reduction.

7722. Do you know what proportion that bears now to the full-pay?—When I served as first-class staff surgeon my pay was 19s.; my half-pay is 10s.; then I lose all the allowances, which brings it down to very much less than what half of my full-pay is worth. Lodging money and servant's allowance, are not taken into account.

7723.—On the other hand, the pay being for service rendered, you cannot compare the claim of an officer for half pay, with his claim for full-pay?—I think he ought to be fairly remunerated for the service he has rendered, when he is placed on half-pay for the convenience of the public.

7724. Was it your committee in the Crimea, or the committee in London, which proposed an increase in the rates of pay for each rank?—It was the committee in London; we did not make any suggestion of that kind.

7725. (*Sir H. K. Storks.*) What was the committee in London?—I am perhaps not right in calling it a committee; it was a certain number of medical officers who assembled at the request of the director-general. The letter forwarding the rates of pay can be referred to in the appendix to the report of Mr. Stafford's committee.

7726. (*President.*) Do you know this paper [*a paper being handed to the witness*]?—I know nothing about it officially. I saw it, but I knew nothing about the drawing it up; it was drawn up at Chatham without any knowledge on my part.

7727. (*Mr. A. S. Stafford.*) What committee do you refer to?—I refer to a letter, to be found on page 314 of the Appendix to the Report from the Select Committee on the Medical Department of the Army, in 1856.

7728. (*President.*) Are you acquainted with the rates of pay, which are mentioned in that recommendation of the director-general?—I do not, at this moment, remember the individual sums; I know the general rate.

7729. Have you no suggestion to make with regard to them, as to their amount?—I think there is room for a reasonable increase of pay, and I think the medical department will be quite satisfied with the recommendation contained in the documents accompanying the director general's letter.

7730. You have no knowledge of the cost which that change would entail upon the public?—I have not.

7731. By what rule do you think that promotion ought to take place, from the rank of assistant-surgeon to surgeon?—By strict seniority.

7732. Is it not by seniority now?—I believe the usual and professed rule is local seniority, within certain stations and districts.

7733. (*Dr. A. Smith.*) What reason have you for stating that?—From the evidence given before Mr. Stafford's Committee, I infer that it is local seniority; I advocate strict seniority, according to the Army List.

7734. (*President.*) You were not aware that that rule applies only to vacancies which arise by death?—I was not aware of that.

7735. As a matter of fact, we are informed by the director-general, that it is only in the case of vacancies created by death, that the seniority is confined to the station at which the vacancy takes place?—I, of course, bow to that authority.

7736. In other cases, are you aware, that when a vacancy is created otherwise than by death, seniority on the Army List is invariably taken?—I am not quite prepared to say that, it has not been my impression.

7737. (*Dr. A. Smith.*) If that has not been your impression, will you state any cases in which you have known that rule not to be observed, and give the names?—I can mention two cases, which occurred to friends of my own; in one case, the surgeoncy of the 66th regiment became vacant; I cannot say exactly how.

7738. Where was the regiment at the time?—The regiment was, at the time, at Quebec.

7739. Was that vacancy occasioned by the death of the surgeon?—That I cannot say.

7740. If I tell you that it was not so occasioned, would you consider that a case in which the senior in the command should have succeeded to it?—No; the senior in the army, on the principle just mentioned.

7741. (*President.*) Was it the senior in the army who succeeded to it?—No: Dr. Tupper succeeded to it.

7742. (*Dr. A. Smith.*) How many were senior to him in the army?—There was a senior assistant surgeon, Mr. Ewing, in Nova Scotia at the very time.

7743. (*President.*) In this case the person who did succeed was neither the local senior nor the senior in the army list?—No, he was not. Another case occurred to a friend of mine, Dr. Murphy, of the 80th regiment. A vacancy occurred in that regiment by the promotion of Dr. Taylor on the 3rd of March 1855, Dr. Murphy being the senior assistant surgeon of the regiment; the officer who was promoted to the surgeoncy was Mr. Irwin, who, I find by the army list, was five months junior to Dr. Murphy.

7744. Was he on the station?—It was in Dr. Murphy's own regiment that the vacancy occurred.

7745. Was the officer promoted on the station?—He was at home, I think, and the regiment was on its way from India.

7746. That was a vacancy in which army seniority would have come in?—Yes.

7747. And the gentleman who was brought in was not the senior?—He was five months the junior, and he was brought into the regiment in which the other officer, five months his senior, was serving.

7748. (*Dr. A. Smith.*) Was the 80th regiment at that time on the establishment of the East Indies, or on the establishment of this country?—It was on its passage home, and Mr. Murphy was with his own regiment; and as the vacancy occurred in his regiment, he must have been on the spot.

7749. (*Mr. T. Alexander.*) Where did the man who succeeded to the vacancy come from?—I do not know. I never heard of him before.

7750. (*Sir H. K. Storks.*) Was Mr. Irwin in India?—No. I believe he was serving at home. On the day that a regiment embarks from India, I think that they are struck off the Indian establishment. I know there is no longer Indian pay or allowances.

7751. (*Mr. T. Alexander.*) Dr. Murphy was senior to the other wherever he came from?—Yes, five months senior.

*Dr. George
Stewart
Beatson.*

8 July 1857.

*Dr. George
Stewart
Beatson.*

8 July 1857.

7752. (*President.*) Were you aware that there is a different rule in operation as to regiments on their passage to or from India?—There are no defined rules that I have ever seen.

7753. The result of promotion by local seniority, of course, is to interfere very much with army seniority?—Yes; it may considerably.

7754. And it may be as irregular as selection would be?—It might, as there is no defined and published roster for foreign service; it certainly opens a door to one man being promoted over another.

7755. What is the promotion from the rank of surgeon to that of first-class staff surgeon, at present?—I cannot say, but I believe that it is selection, or seniority and selection combined; it is not strictly seniority.

7756. (*Dr. A. Smith.*) Are there any other cases that you would wish to mention?—There was a gentleman who was promoted at a very early period of his service, Dr. Matthew, at Gibraltar, and I know that he was promoted over the heads, I am afraid to say of how many assistant-surgeons. I think I have heard that there were seniors to him in the Mediterranean at the time. I think he was promoted in September 1849.

7757. Mr. Matthew was sent to the Emperor of Morocco to attend upon him, and the reports that reached this country and the government were so strong in his favour that the government recommended that he should be promoted; and under these circumstances, the then head of the department felt that it was his duty to obey the wishes of the government. Are you aware of that?—No, I am not aware of that, and I doubt whether the department generally is aware of it.

7758. Are there any other cases that you wish to mention?—Mr. Francis Reid was promoted very early into the 91st regiment at the Cape.

7759. Are you aware that he was appointed to a death vacancy,—he being the senior in the Mauritius when the death vacancy occurred?—The regiment was at the Cape.

7760. Still Mr. Reid was serving in the Mauritius; and the vacancy having occurred in the regiment, he proceeded to the Cape—are you aware that he was the senior in the Mauritius?—He might be senior at the Mauritius, but there were two or three in Ceylon who were senior to him.

7761. Are you aware that that has nothing to do with the Mauritius in the case of death vacancies?—No.

7762. (*President.*) You are not made aware of the limits of the stations?—No; I know that in my own case a death vacancy occurred in the Mauritius; I was serving at Ceylon, and I got the promotion.

7763. You conceived from that that the Mauritius and Ceylon were the same?—Yes, the Mauritius, Ceylon, and the Cape.

7764. (*Mr. J. R. Martin.*) As being within one command?—No, not one military command.

7765. (*Sir H. K. Storks.*) Is not Mr. Reid's promotion accounted for?—There were two seniors to him in Ceylon.

7766. (*Dr. A. Smith.*) Are you aware that on such a station as Mauritius, if a death vacancy should occur and there is no one but very young officers who are not eligible, either from length of service, according to the regulations, or from their not having served a sufficient time to justify their being promoted, that a person would be taken from another station to fill the vacancy?—There was an officer at the Mauritius who was very little junior to me.

7767. He was junior to you?—Yes.

7768. By how much?—About a year.

7769. (*Mr. J. R. Martin.*) Referring to your recent answers, do you not think it highly desirable for the good government of the medical corps, that all the regulations affecting the interests of its officers should be published for general information?—Yes, and clearly defined.

7770. (*Dr. A. Smith.*) Is there any other department in the public service that has its regulations published and clearly defined?—In the case of regimental promotion, I never heard of any doubt.

7771. (*President.*) Can the Commander-in-Chief make any promotion except according to the warrant?—I am not aware that he can, except brevet promotion. When I served in a regiment, I never knew the slightest doubt as to who would get any vacant step.

7772. The Commander-in-Chief can make promotions by selection under certain circumstances, but that selection is regulated by the royal warrant?—Yes, of October 1854, I think.

7773. (*Dr. A. Smith.*) Can anything different occur in the medical department? Can the head of the department make promotion without its being sanctioned by the Commander-in-Chief, and the secretary-at-war?—I cannot say.

7774. (*Mr. J. R. Martin.*) Has not the non-publication of the rules and regulations of the medical department caused much dissatisfaction in the corps?—It has caused very great dissatisfaction.

7775. (*Mr. T. Alexander.*) All the rules regulating the roster, and the fixed stations abroad, ought to be classified and published?—They ought to be clearly defined and published.

7776. Is not the want of those regulations being clearly laid down considered a great grievance by the medical department?—Yes.

7777. If those rules were clearly laid down, do you not think that candidates would be induced to enter Her Majesty's service?—I think it would be some additional inducement.

7778. (*Mr. J. R. Martin.*) They would enter the service with a better understanding of their future condition?—Yes, they would know exactly what they had to expect, and what they had not.

7779. (*President.*) At the present moment the officers in your branch of the service are not acquainted with the rules generally speaking, for example, those which have been explained to you to-day?—No, I was not aware fully of the rules of promotion, except from what I had gathered from the evidence before Mr. Stafford's committee and other accidental sources.

7780. You were not aware of the exact limits of the circles within which seniority is to rule, and you were not aware of the distinction between death vacancies and others?—No, I was not aware of the distinction between Ceylon and the Mauritius, for instance.

7781. Do you consider that promotion to administrative rank should be by selection or by seniority?—I think by seniority as a rule.

7782. In that case you would have no rule but that of seniority pervading the whole service?—I would not say that cases might not arise in which the service rendered was so great, and the officer's merits so unmistakeable, that an exception should be made for the good of the service.

7783. Even apart from that, is it not important, in order to get youth and physical energy into the higher posts, that selection should be made?—I think, that with compulsory retirement, one objection to seniority would be removed.

7784. Not if you found it necessary for financial reasons to limit the amount of the compulsory retirement?—As long as the department is without compulsory retirement, there will always be many old men in it.

7785. It is quite clear that the seniority system is compatible with youth in the upper ranks if you make the retirement liberal enough, but without will not the department get so aged in the upper ranks that it will become inefficient?—I would recommend special promotion for special merit and service, and equally non-promotion where there was clear inelegibility or unfitness.

7786. (*Mr. J. R. Martin.*) Are you not aware that the question put by the president applies strongly to officers of the medical department in the Indian army, and that it is paralysed by an exclusive system of promotion by seniority?—Yes; but I understand that

there is a prospect of compulsory retirement being introduced into the Indian army. The cases of selection in the East India Company's service are very rare; though the power is retained, it is not exercised in one case in twenty.

7787. (*President.*) It is on account of the jealousies and heart-burnings which the system of selection creates that you object to it?—Yes, very strongly, and for other reasons. I think, in the first place, that it is a system under which there is always a liability of doing great injustice to deserving officers, and I think it is a system that will always create dissatisfaction. I think also that it is a dangerous power to exercise.

7788. Does not the system of seniority operate with great injustice upon deserving officers; may not a very deserving officer be languishing without promotion, while an inferior officer may get promotion over his head?—That may be.

7789. (*Mr. J. R. Martin.*) Does not an absolute rule of seniority in promotion overlook the interests of the soldier?—I only advocate it as a rule, not as an unexceptionable rule, where the service would clearly benefit by departing from it.

7790. Is it possible to take the absolute rule of the muster roll as the ground of promotion to any office?—I think decidedly if the first senior officer is fit for the purpose he should be taken.

7791. And when he is not fit, ought he not to be superseded?—I think there ought to be certain defined rules, under which such a case would be met.

7792. (*Sir H. K. Storks.*) Who is to decide whether a man is fit or unfit?—The Commander-in-Chief.

7793. Who is to advise the Commander-in-Chief?—He ought to have the necessary documents laid before him.

7794. Who is to send them to him?—The head of the department.

7795. Who is to furnish them to the head of the department?—In a regiment the commanding officer would be as good a judge as anybody else, whether a surgeon was physically and mentally efficient.

7796. (*President.*) He could judge of the zeal and attention to his duties displayed by an officer, but not of his skill as a medical man?—He could judge by the result, which is the best test of all.

7797. (*Mr. A. S. Stafford.*) But there may be cases with regard to climate, and with regard to strategical reasons for occupying an unwholesome situation, with regard to a badly-built hospital, and the difficulty in supplying drugs or medical comforts; all these may be entirely independent of the medical officer, but they may affect considerably the number of his cures?—I think that an intelligent commanding officer would always take those things into account.

7798. (*Dr. A. Smith.*) With reference to one of your late answers, when you say that the Commander-in-Chief ought to select, do you mean it to be inferred that the Commander-in-Chief is more capable of judging of what constitutes a good medical officer than the head of the department?—No; he would act upon his recommendation.

7999. Do you mean to say that the Commander-in-Chief is more intelligent and more capable of judging of the merits of a medical officer, and his eligibility for the promotion, than the director-general ought to be?—No, I do not.

7800. Then if you do not, do you not, by the observation you have made, leave it to be understood that the director-general is more likely to be an unjust man, and to promote unfairly, than the Commander-in-Chief?—I think that the Commander-in-Chief ought to exercise a control over all appointments on the recommendation of the director-general. In an answer given by the Duke of Cambridge before Mr. Stafford's committee, he says, that his authority is merely nominal; he is asked at Question 3676: "Your Royal Highness is probably aware that the question of promotion, except with regard to regimental surgeons, rests entirely with the director-general?" and his answer is "under the authority of the Commander-in-Chief." He is then

asked: "But the evidence which has been given before this committee has shown that the exercise of that authority is merely nominal?" and his answer is: "I think it ought to be more than nominal; I think that if that is so, it would be well that the Commander-in-Chief's authority should be more shown than it is at this moment. As I understand the question, it is this: that supposing a medical officer to be promoted out of his turn, it might appear to be an act of favouritism, on the part of the chief authority of the medical department. I think that that would be obviated if, in cases of that sort, the director-general were to explain to the Commander-in-Chief most fully why he had promoted one man over the heads of others, and that the final decision should rest with the Commander-in-Chief." I cordially agree with that answer of the Commander-in-Chief.

7801. As you say, that you do not consider that the Commander-in-Chief is more able or more likely to be capable of forming a proper opinion as to whether a medical officer ought to be promoted, do you, as you propose that the matter shall be submitted to him to decide, mean it to be understood, that you have not confidence in the sense of justice of the head of the department; or, that you think the Commander-in-Chief, as he holds a higher appointment, is more likely to have a regard for justice than the head of the department?—No, I do not say so.

7802. Then why would you take it out of the hands of the director-general?—Because I think the Commander-in-Chief ought to be the head of the medical department as well as of every other portion of the army. As far as regards the question of patronage, I should wish him to exercise only a controlling power, and not to take the initiative.

7803. What evidence have you that he does not exercise that controlling power at present?—I do not know what he does at present, but I refer to the answer His Royal Highness has given, as above quoted.

7804. A question was put to me, to ascertain whether the Commander-in-Chief had ever refused to confirm a recommendation of mine, and I said I thought he never had; and an impression seemed to be produced by that, that therefore the exercise of his power was merely nominal, which was an unjust impression; although I said that he had not done so, might it not have been, that he saw no occasion to do it?—Most certainly; I do not question that for a moment.

7805. (*President.*) Your reason for thinking that the exercise of the authority of the Commander-in-Chief is only nominal, is founded upon his own assertion to that effect, which you find in his evidence?—Yes.

7806. You conceive, do you not, that he must know best how that matter stands, and how his own authority is exercised?—Yes. Certainly.

7807. You do not pretend to know more of the matter than he does?—Nothing but what the report of Mr. Stafford's committee affords me.

7808. To go back to the question of seniority, you say that heart burnings and jealousies are produced by a system of selection. Is not stagnation produced by a system in which seniority alone is the rule of promotion?—Yes; without compulsory retirement, I feel bound to acknowledge that seniority would be very difficult and injurious.

7809. Compulsory retirement will give opportunities for promotion, and it will keep men young; but it does not give the stimulus that competition does?—In the other scientific corps of the army they trust to seniority.

7810. Do they not suffer extremely from that, by the very great age of the officers in the upper ranks, and has it not been attempted to remedy that by a system of retirement which is so inordinate in amount that it cannot be extended to the line?—No doubt it involves very great expense.

7811. Does not great practical inconvenience result from it, where you have, for instance, two armies together in the field, that your English artillery officer

*Dr. George
Stewart
Beatson.*

8 July 1857.

Dr. George
Stewart
Beatson.

8 July 1357.

is junior though a much older man?—They generally manage to select young men by some means without interfering with the regimental promotion.

7812. Do you know how the Duke of Wellington promoted Sir Alexander Dickson in Spain?—Yes, I know very well the whole circumstances.

7813. He got him made a Portuguese general?—Yes.

7814. (*Mr. J. R. Martin.*) In scientific bodies has it not been found that torpor and inertia have been produced when men have been promoted on the rule of the muster roll rather than on account of scientific attainments?—Yes, there is a great deal to be said against seniority *in toto*. I am advocating it as a rule, but not a rule to which there are to be no exceptions.

7815. (*President.*) If you selected from 100 men, is it not 99 to 1 against seniority giving you the best man?—That is, supposing you have only a few good men in the 100.

7816. But it is 10 to 1 against its giving you the 10 best men?—Yes.

7817. (*Mr. J. R. Martin.*) You would always take a man as he rises on the muster roll, by the rigid rule of seniority?—Something might be done to obviate that by local temporary rank; but I have not advocated the rule without exceptions.

7818. (*Sir H. K. Storks.*) Would it be by selection?—Yes, it would be by selection under clearly defined rules.

7819. (*President.*) If seniority were strictly enforced in the executive ranks, and it were made seniority according to the army list, and not according to districts, and without any exceptional rules as to death vacancies or other vacancies, and if the selection made for the administrative rank were made by recommendations given in to the Commander-in-Chief of the army, accompanied in each case with the grounds of the selection, do you think the service would be then satisfied?—Provided no good men were passed over; selection is quite liable to make mistakes.

7820. (*Mr. J. R. Martin.*) If the rule of selection were not subject to human error, it would then be a perfect system?—Yes; but we cannot hope for that.

7821. (*President.*) If it was conducted as I have stated, and the whole matter were to be fixed by warrant, like the promotion in the combative ranks, at any rate, that amount of dissatisfaction which arises from ignorance of the rules by which the director-general is governed would disappear?—Certainly.

7822. (*Sir H. K. Storks.*) Would the giving of local rank be a proper thing among the medical officers?—It would be more proper than promoting a man *bonâ fide* over the heads of a large number of others.

7823. Would that be a good system, do you think?—I see no objection to it.

7824. When an officer has been promoted to his service, he again reverts to the inferior rank. An officer who has been inspector-general in Canada becomes to be deputy inspector when he comes to England?—It might not be very agreeable to him.

7825. Is it not then an unpopular thing?—It is so far unpopular because it invariably leads to *bonâ fide* promotion, and therefore a number of officers who think themselves quite as much entitled to promotion have been disappointed.

7826. In what instances has it led to promotion where local rank has been conferred?—Mr. Mouat was promoted locally, and, I understood some time ago that he is to be brought in on full-pay as deputy inspector-general.

7827. Has he been brought in?—Not yet—he is now on the half-pay of a staff surgeon of the first class. I find I was wrong in saying that no case had yet been confirmed. Dr. Ligertwood's local rank was confirmed; he is now second-class staff surgeon.

7828. (*Dr. A. Smith.*) Are you aware that Dr. Ligertwood was specially recommended for promotion, but it was found he was under five years' service, and therefore not eligible for the rank, but the Minister for War said he should hold local rank until he had served the period necessary, when his rank as staff surgeon

of the second class should be rendered substantive?—I was aware that he had not completed his period of service, viz., five years.

7829. He was to be confirmed in the substantive rank the moment he had completed that period?—I did not know that.

7830. (*President.*) In many of those cases what may appear to be confirmation is this, that a man does not get local rank unless he is a man of some eminence; it is given for special purposes; he is selected as a man of high distinction; you may look upon his subsequent rank as a reward for his service?—Yes; but those officers who have been passed over feel that it has been unfair to them.

7831. As in the case of any selection?—Yes; with very rare exceptions.

7832. If the man is a better man, there is nothing unjust in it?—No; if he really is a better officer.

7833. You object to putting any man over another man's head?—It ought to be avoided if possible. Nothing but the good of the service can justify it.

7834. Can any other promotion be carried on in that way. Do you suppose we should have the same men in Westminster Hall, if the judges were appointed by seniority?—It is scarcely a parallel case. I think if a man has performed his duty faithfully and well, he has reason to complain that another is put over his head; particularly if the other has done no more.

7835. (*President.*) Do you think you could by brevet rank reward good service?—Yes.

7836. And also by good-service pensions?—Yes.

7837. How would you give them?—For general good service.

7838. Would you give it irrespective of length of service or not?—Not except in cases of very distinguished service.

7839. What restriction would you put as to service?—I think a man might be required to serve 12 or 15 years.

7840. So that what you would give as a reward, because you wish to maintain seniority as to promotion, would become a reward for seniority as well as for service, if you exact 15 years from a man who is to receive a good service pension?—In cases of very distinguished service I would make an exception; but, even with the above restriction, there would be selection from a certain class.

7841. When you have seniors for promotion, ought not the good-service pension to be given strictly for distinction, without any reference to length of service whatever?—I think, except in cases in the field, you must prove what a man's service is.

7842. (*Sir H. K. Storks.*) You would not give a good-service pension by seniority?—Not strictly. In all cases of special service, this would be one fair means of rewarding it.

7843. Would not that be a fair ground for promotion as well?—Yes; but then you must reward a fortunate man at the expense of an unfortunate one, unless you give brevet rank.

7844. What advantage would brevet rank confer?—Superior social position.

7845. You would not allow an executive officer with brevet inspectorial rank to inspect?—Certainly not.

7846. (*Dr. A. Smith.*) You stated that when a person was conscious that he had discharged his duties well, and another was appointed over him he might justly feel sore; who is to be the judge whether that other person had really done his duties equally well with the one that was passed over?—That is one of my objections to special promotion—you cannot prevent men having those feelings, and that causes discontent.

7847. (*President.*) Seniority is open to that; you would not promote a man who was notoriously unfit?—No; I would have promotions for specially distinguished service, and non-promotions for unfitness.

7848. That is selection only; all you require for your selection is very strong cases?—Yes; and that

the rules under which those selections shall take place should be known in the department.

7849. (*Dr. A. Smith.*) Are you aware that out of the ten officers whom I generally see about twice a week, not one of them enters my office and has conversation with me in reference to their claims that does not maintain that he is No. 1, of his grade, and that all in that grade are inferior in point of talent to him?—That is human nature; and shows all the more the necessity for defined rules.

7850. That being the case, can a man be a judge in his own case, whether he merits promotion or not?—I think, making all due allowance for a man's personal bias, he knows pretty well whether he has done his duty as well as others, and whether or not he has been rewarded.

7851. (*President.*) Cannot a man be a pretty good judge as between any two men, but not between himself and another?—Certainly.

7852. Reduction to half-pay in consequence of the termination of the war and the restoration to full-pay from half pay, goes by seniority, does it not?—I should say not.

7853. (*Dr. A. Smith.*) Have you never been told by me, that according to the total length of service officers on half-pay are to be restored to full-pay?—Yes. I have been told so verbally.

7854. (*President.*) Are you aware whether or not it is the invariable practice to make reductions and restorations depend upon the length of service of the officers to be selected?—That rule has not been strictly followed. I know exceptions have been made.

7855. (*Dr. A. Smith.*) Will you mention any instances where a man has been restored to full-pay who has not had the longest general service?—Dr. Hadaway, Dr. Macdonald, and Dr. Gordon, have been restored to full-pay, and Dr. Hume is still on half-pay, he is senior to them in the service, and senior to some of them in rank also. I find, in the case of second-class staff surgeons, that William Braybrooke stood second and he is restored to full-pay first.

7856. Who was senior to him?—Mr. Brush.

7857. Are you aware that Mr. Brush is on sick leave, and totally incapable of serving?—I find that Mr. Powell stood fifth in actual length of service; he was restored fourteenth.

7858. Are you aware that Mr. Powell was put on half pay on account of bad health?—No.

7859. (*President.*) Have you any other cases?—Mr. Fyffe stood fifteenth, and he has been restored second; Mr. McArthur stood seventeenth in actual service, and he has been restored third.

7860. (*Dr. A. Smith.*) How do you mean restored third?—Braybrooke, Fyffe, and McArthur were all restored to full-pay in the same Gazette in November 1856. I have classed them 1, 2, 3, according to their length of service.

7861. Were they restored before they ought to have been restored?—Mr. Black stood 10th, and he was restored 9th; Mr. Hanbury stood 7th, and he was restored 4th.

7862. Seventh in point of general service?—Yes; Mr. Macbeth stood 8th, and he was restored to full-pay 5th; Mr. Sparrow stood 9th, and he was restored to full-pay 6th; Mr. Blunt stood 10th, and he was restored 7th; Mr. Crerar stood 13th, and he has not yet been restored.

7863. (*Sir H. K. Storks.*) Are those surgeons or assistant-surgeons?—Second-class staff surgeons.

7864. (*President.*) Those persons who were omitted may be officers who are on half-pay for ill-health.—They have since been restored, and 12 men senior to Mr. McArthur, who was restored in November 1856, have since been restored to full-pay.

7865. Have you taken seniority in the rank in every case, or seniority in the whole service in all ranks?—Those officers had only been in one rank before; I take seniority according to actual length of service.

7866. But their seniority according to actual length of service does not always tally, even in the rank of surgeon?—No; I find they stand here in this way:

Mr. McArthur according to actual length of service stands 17th; according to seniority in rank he stands 8th.

7867. That is to say, although the assistant-surgeons are promoted to surgeons by seniority, yet the system of districts operates so capriciously upon officers that their seniority is lost sight of, and their army service is lost sight of in their promotion to surgeoncies?—Frequently; this officer, for instance, stands in one case 8th and in the other 17th. Then there were several officers in my own grade who were kept on full-pay, junior to me both in rank and service.

7868. (*Dr. A. Smith.*) Will you name them?—Mr. Stone is one, Mr. Paynter is another, and Mr. Wood is another.

7869. (*President.*) Do you approve of the system of counting officers' rank, not by their seniority and the dates of their commissions within their rank, but by the whole length of the service?—I think it does frequently great injustice to officers.

7870. On the whole it approaches nearer to your system of seniority a good deal?—In my own case, several of those ten men who are said to be senior to me, were in England and in the Mediterranean when I was promoted over their heads. I have always felt if I was promoted over them, then, in justice, I deserve to have the advantages of that position still.

7871. That is, where selection is made upon good grounds you think it ought to be permanent?—Yes; officers ought clearly to have the advantage of it ever afterwards.

7872. You stated a little while ago, that it depended upon the roster of foreign service—what do you apprehend to be the rules by which officers are sent on foreign service?—I do not know.

7873. The appointments to chief commands in war are by selection?—Yes.

7874. That, I apprehend, you do not object to?—No, I do not.

7875. The responsibility is so great that you cannot appoint a man by seniority to be the head of the medical department of an expeditionary force?—No; not in special cases.

7876. What is the case with regard to ordinary service in the lower ranks; do they go by turn, or how?—There are no defined rules that I know of.

7877. (*Dr. A. Smith.*) Do you not believe, from the experience you have had in the service, that, generally speaking, officers are sent on foreign service according to the length of time they have been at home?—Yes; but if an officer was to consider that he was out of his turn when ordered to go, I do not know that he would have any rule to fall back upon, to show that he was not first for foreign service.

7878. There has been a practice long observed, at least for the last forty years, and do you think that it is not the rule almost invariably to send an officer of the grade who has been longest at home on foreign service before one who has been but a short time at home?—I think that any return, including officers of the same standing, would show a very different proportion of home and foreign service in many cases.

7879. You are aware that we do not calculate the number of years a man has been on foreign service, say that A. and B. arrive to-day from foreign service; they are generally considered as the last of their grade to be sent on foreign service again without reference to the length of time they may have served previously abroad?—I do not know what is the rule.

7880. Have you seen many instances to the contrary?—There were two officers,—one came home before me, Dr. Humphrey, who had served in the Crimea, and served for a considerable time. During the time he was there, there were several deputy inspectors at home, who are still at home, while he is in Nova Scotia, and has been for some time.

7881. Name them?—Mr. Carter, Mr. Bell, and Mr. Gibson. Mr. Lawson also is gone to the West Indies.

*Dr. George
Stewart
Beatson.*

8 July 1857.

Dr. George
Stewart
Beatson.

8 July 1857.

1882. You have not shown any that had been longer at home?—Mr. Lawson went to the West Indies within a few weeks after he had been at Scutari. Mr. Bell had been at home for some years, I think.

7883. Are you aware that Mr. Bell is the senior officer in the department, and a man who, if this commission do not lead to any change, must of necessity become an inspector general, of local rank, and ought to have been a week ago; therefore, under those circumstances, surely you would not consider it just to the service, or to Mr. Bell, to send him to a foreign station, and to bring him home again in three months?—I was not aware of that; but there is an officer above him.

7884. Who?—Mr. Barry.

7885. Are you aware that there are more than two local inspector-generals to be made?—I am not aware of that; I am aware that there are two inspector-generalships, which will be vacant this year; Dr. Scott at Malta, and Dr. McLean in Dublin; I believe five and three years is the usual time.

7886. Are you aware that Mr. Dartnell, who had been only a short time at Chatham as the principal medical officer of that station, where it is generally considered undesirable to change the principal medical officer in a shorter time than three years, was, in consequence of his being senior, notwithstanding warned to go abroad, in order to make a place for one of the officers who was returning from foreign service?—Mr. Dartnell, I know, had a very long period of home service.

7887. Are you aware that he was removed?—I am aware that he was removed from Chatham.

7888. On account of being longest at home?—I do not know; I know that he had been a long time in England.

7889. (*President.*) Your complaint is, that there are no published rules by which the service know by roster when service will fall to their turn?—Clearly.

7890. (*Dr. A. Smith.*) Were you not aware, when you were at Chatham, that in the principal clerk's office there was a small list, containing perhaps a dozen names of officers first for foreign service?—I do not remember any list of officers of that kind in 1838.

7891. (*President.*) Is that a list which is hung up in all the hospitals, or only to be seen by officers who happen to be stationed at Chatham?—I do not recollect seeing the list.

7892. In large hospitals, it could not be done, but Chatham is a dépôt where officers are concentrated to fill vacancies abroad, therefore Chatham is the only place where a roster of that kind could be of any avail?—If it existed in 1838-9, I have no recollection of seeing it, I have never served at Chatham since.

7893. (*Sir H. K. Storks.*) Could you find how you stood on the roster for foreign service by application to the Director-General?—I cannot answer that question.

7894. (*Dr. A. Smith.*) Do you know of any person who has asked me when his turn for foreign service would come, and I have refused to tell him?—I do not know of any such circumstance.

7895. (*President.*) Do not you think that the conditions of the service ought to be made known to officers without personal application?—I think so.

7896. (*Sir H. K. Storks.*) You think that a roster should be kept and published?—Yes, and the stations for each grade, the date of the arrival in England of officers, and the order in which they stand for foreign service.

7897. (*President.*) But with the power of departure from that in time of war?—Yes, that is a special case. I would also respectfully say, that the period of foreign service ought in all cases to be limited.

7898. (*Sir H. K. Storks.*) Is it not limited now?—No, it is unlimited.

7899. (*Dr. A. Smith.*) How would you then propose that the list should be published?—I would

propose stations for each grade, then a nominal list of officers as they stood, with the date of their return; and from that an officer would see at a glance where he stood for going out—of course casualties might occur when an officer might be obliged to go sooner than otherwise; but with a defined period, officers would have a good idea when their turn would probably come.

7900. Would you propose that a list should be circulated among the medical staff officers wherever they were?—It should be kept at the Medical Board in London. It should be printed, showing when an officer became first or second for foreign service. I think that is done in the royal artillery.

7901. Are you aware at the present moment that the assistant-surgeons, the junior officers at Chatham, would say, if you asked them, who was the first to embark for foreign service, "I am" or "I am not"?—That was not the case when I was at Chatham in 1838. I have known an officer walking about in the morning, and without the slightest idea of leaving be under weigh in the afternoon for the West Indies.

7902. (*President.*) You said as to promotion that the director-general must be informed of the character of the officers serving under him by reports; do you mean confidential reports?—Not secret reports.

7903. Do you mean that a report though not published should be communicated to the officer affected by it?—I think the principal medical officer if he can communicate nothing favourable or anything unfavourable, ought to let the officer know.

7904. Is it the general practice to do so?—I believe not.

7905. It has been stated by one officer holding an inspector's rank, that he invariably, whenever he made an unfavourable report, communicated the substance of it to the officer charged?—It must depend upon the principal medical officer; I think every man ought to do it.

7906. (*Dr. A. Smith.*) Do you not think, from your experience, that inspectorial officers who were anxious to be popular, and to enjoy the good opinions of the junior officers, unless they were compelled to do it, would never report unfavourably of officers?—They would not be fit for their positions. In giving a confidential report the principal medical officer ought to refer to professional points chiefly.

7907. (*Mr. A. S. Stafford.*) Are you aware that it has been stated by General Wetherall that at the Horse Guards it is the system to communicate to officers the substance of reports by which they are affected?—Yes; I know that is the system.

7908. You wish to see it introduced into the army medical department?—Yes; I know a case where a most unjust charge was brought by a commanding officer against his regimental surgeon; the moment it reached the general of division he brought it to the notice of the Commander-in-Chief, who ordered the deputy inspector-general to investigate the matter and report upon it, and it turned out that the officer deserved great credit instead of blame. If that report had been made by the principal medical officer it would have been more secret.

7909. (*President.*) The officer affected might never have heard of it?—No.

7910. (*Dr. A. Smith.*) If it had been made by the inspector-general to the director-general, do you infer that the officer never would have heard anything about it?—I think in your evidence you said that might take place. At question 357, you were asked, "Therefore there may be charges brought against medical officers who are perfectly guiltless, but which may stand as bars to their promotion, and which charges they may never hear of?"—and your answer is, "There might be such, but I do not think there are such."

7911. (*President.*) Read the next answer?—"But according to the working of the system there might, because as you alone are the court of appeal, as far as promotion goes, upon those scientific points the charges against those gentlemen would never be known to them, but would be silently operating to

"their injury, when the question of competency and "fitness for promotion should come before you?"—"And his answer is, "I think in that case they would "be known to them, because I should tell them."

7912. (*Dr. A. Smith.*) Do you assume that the director-general of the department is a man regardless of justice?—No; it is simply in your own answer that I infer it might be so.

7913. (*President.*) I understand it thus, that there is a specified rule at the Horse Guards, that the substance of the report shall be communicated, but no such rule exists in the medical department, though it is the practice of the director-general to do so?—Yes.

7914. Are you not aware that the Commander-in-Chief never interferes with reference to confidential reports made against medical officers?—I was talking of the Commander-in-Chief in Madras; it was referred to him, and it was investigated on the spot.

7915. (*President.*) Do you know of any case where an inquiry was made in a similar manner with regard to a confidential report made by a medical officer?—I think Dr. Anderson's promotion was suspended for some time; he was subsequently promoted and had his promotion antedated. I understood it was in consequence of some unfounded report that had been made from the Cape. He belonged to the 8th hussars.

7916. (*Dr. A. Smith.*) Are you not aware that his promotion was suspended on account of his being in bad health?—He was in the Crimea with his regiment.

7917. Are you not aware that as soon as he was in a state of health to admit of his being promoted, he got the first vacancy, and had his commission antedated?—His commission was not antedated for some time. I have a pretty clear impression that Sir John Hall told me that reference had been made to him with regard to Dr. Anderson. His first promotion occurred in May, I think, and it was some time before the subsequent antedating took place. I think not till August.

7918. (*Mr. J. R. Martin.*) Generally speaking, is it the impression in the service that promotions are made on the ground of fairness, or not?—I should be very sorry to say anything to the contrary, but I may say that officers often feel that they have had a fair claim to promotion, and they have been disappointed in getting it.

7919. (*President.*) Is it not your opinion that it is ignorance of the rules upon which promotion is conducted which gives rise to misrepresentations and suspicion, but which may very often be entirely unfounded?—Yes.

7920. Have you any other observation to make on the subject of reduction or the confidential reports?—I would wish to say, with regard to the reduction; that in December 1854, I was promoted from the 51st regiment. At that time there were several officers in England. Mr. Gammie was in England, Dr. Templeton was in the Mediterranean, Mr. Denny was in the Mediterranean, Dr. Henderson was in the Mediterranean and I was promoted over those officers and sent out to Turkey; and at the end of the war I was within about one third of the top of the list of staff-surgeons of the first class. I came home without supposing that the reduction could reach me; but when I arrived I learned for the first time that a new rule had been introduced under which, if I had known it, I would not have accepted promotion, that instead of the reduction being from the bottom of the list, the reduction should be according to seniority in actual service; instead of the junior in rank, the junior in actual service. By that rule I came within the reduction, while several of those officers who were in the situations I have mentioned were retained on full-pay, and the others, as I infer from what has passed, stand before me for restoration to full-pay. In the first place I feel that the introduction of the new rule was more considerate to one class of officers than to another.

7921. When you say it was a new rule, had it not been the rule previously?—The invariable rule of reduction that I have seen followed has been strictly from the bottom of the list according to juniority in rank.

7922. There was no published rule to that effect?—It was the practice of the service.

7923. (*Dr. A. Smith.*) There having been no opportunity of making a reduction in the medical department of the army since the peninsular war, are you aware what the rule was on that occasion?—No.

7924. Are you aware that upon that occasion no rule was observed? There were certain stations in England,—for instance, Colchester was one, Chichester was another—where there were general hospitals and when the sick were exhausted in those general hospitals, the medical staff of those hospitals were the officers that were at once reduced?—I think, if any rule of that kind is to come into operation, the officers should be made aware of it before they are promoted. I do not know what took place after the peninsular war.

7925. Are you aware that the reduction which took place on the termination of the Crimean war was the first instance in which, in modern times, any rule could be applied so as to regulate reduction?—It was the first instance since I entered the service in which any reduction has taken place.

7926. (*President.*) Was there no reduction after the last Chinese war?—No.

7927. (*Dr. A. Smith.*) Are you aware that from necessity there were a very great number of medical officers passed over in the promotions that took place early in the Crimean war, who would have been very greatly, and in my opinion most unjustly, treated, if when they, equally eligible and perhaps more so, arrived in this country, and became available to send to the Crimea, having more claim to be promoted to the rank of staff-surgeons of the first class than those that were, had been put on half-pay, and the comparatively young officers who from necessity had been promoted had been kept on full-pay?—I am speaking of those that were at home as available for promotion; then, afterwards, Dr. George Taylor was at Hounslow.

7928. Are you aware that Dr. Taylor, though senior to you, was not eligible for promotion, being a surgeon in a cavalry regiment?—I have understood that he could have had promotion in March 1854, if he would have exchanged from the cavalry; and if he did not exchange, I think he should suffer and not I.

7929. Are you aware that five or six artillery medical officers, at the time that the amalgamation took place, sent forward a representation to the Commander-in-Chief demanding that if the amalgamation was to take place, they were not to be subject to be promoted out of the regiment?—Yes.

7930. Are you aware that the five or six represented the body, and that the body rose in arms the instant they knew that such a proposition had been made by the five or six, and immediately claimed some alteration, so as to render themselves eligible to be promoted generally?—If the artillery medical officers, as a body, had made any such requisition, I think they ought to have suffered for it, and have come in accordingly to the position in which they subsequently stood among staff-surgeons.

7931. Upon a strict investigation, it was found that a very few, those who happened to be at Woolwich at the moment, forwarded that recommendation to the great annoyance of the majority of the body?—I am not aware of all the circumstances.

7932. (*Sir H. K. Storcks.*) Looking at the capricious nature of the rule of promotion according to stations and districts, would it not be fair to take a man's whole length of service, when you can, in cases of promotion and reduction?—I think, in case of reduction, where the loss of service is so serious in amount, it is hard to punish me or any other man for the sake of another. When another man is out of the way, it is his misfortune, but it is not our fault. In the present instance, there are officers retained on full pay because they are senior to me on service, who were serving

*Dr. G. Stewart
Beatson.*

8 July 1857.

Dr. G. Stewart
Bcutson.

8 July 1857.

under me at Balaklava. I, the principal officer, come home, and am reduced, and officers of the same grade who served under me are retained, because they are senior to me.

7933. (*Sir H. K. Storks.*) Therefore you do not gain the advantages from your promotion which you think you are entitled to?—My promotion has been a clear injury to me. I would not have left the 51st regiment if I had known that anything of the kind was to take place.

7934. (*Dr. A. Smith.*) Do you believe that you would have been promoted when you were, if those men now serving under you had been available for promotion?—Officers have been promoted for special service in the Crimea. I had very special service in Burmah; I know that I was favourably reported upon, and I certainly did think that my early promotion at home was in consequence of that service.

7935. (*President.*) Have you any other observation to make upon the subject of reduction?—There were several officers junior to me in rank and service, who have been kept on full-pay serving at home.

7936. (*Dr. Andrew Smith.*) Have you not been given to understand that those officers were merely temporarily retained, and that they are not officers to be permanently kept on the full-pay list?—One was employed at Portsmouth, and one at Aldershot. I found those officers removed, and I came to the conclusion that they were permanently on full-pay.

7937. Had I not told you that they were not?—No, I was not told to the contrary.

7938. Had I not told Mr. Crawford that they were not?—I have not seen him since I have been in town.

7939. Is it not the impression abroad that those men are only temporarily retained?—Mr. Crawford told me that he hoped to be able to tell me. I do not know what impression is abroad.

7940. Did I not mention to you that Dr. Wood had been for a time employed in very important duty at Portsmouth, and that it was very important as he understood the duties of the disembarkation of the sick and the disembarkation of troops, to leave him there, as it would not be a station permanently requiring a medical officer, as staff-surgeon?—I do not remember your saying anything to me as to Dr. Wood, when I saw you in January. Dr. Wood was then at Chatham, he had left Portsmouth; I do not think, when I saw you on returning from the Crimea, I had any conversation with you as to Dr. Wood; you mentioned Dr. Reade specially—that he had been retained in consequence of the Chatham hospital.

7941. Yes, retained for temporary duty, but Dr. Reade at that time was warned for half-pay?—I allude to what you told me in February last.

7942. Are you aware that for some considerable time past Dr. Paynter and Dr. Wood both have been told that they are only serving for a few weeks with the understanding that at the expiration of that time they will be put on half-pay?—I heard so indirectly the other day; but I find they are still in this month's army list.

7943. (*President.*) With regard to relative rank, have you any suggestion to make upon that point?—I think that an assistant-surgeon after seven years' service, if not after five, should have the rank of captain.

7944. Do you think that medical officers should sit on courts martial or upon mixed boards according to the dates of their commissions?—Yes.

7945. Would you make a medical officer the president of a court-martial?—The position of president has always been considered to involve military command, and I think that is a question which I must leave for the military authorities to decide.

7946. (*Sir H. K. Storks.*) Did you ever know medical officers sit on courts-martial?—Yes.

7947. Where?—I was put on one according to my relative rank but I felt that it was by courtesy.

7948. What made you think so?—Because I have heard military officers frequently say that we had no claim to it.

7949. Can you show any regulation to the contrary?—There is a letter from the Duke of Wellington, as to the presidency, with reference to an inspector-general in the West Indies, soon after the death of the Duke of York.

7950. Can you refer to any regulation?—It was an order. His Grace puts it on that ground that the presidency involves military command, and in no case is a medical officer eligible to sit as president. I know that there is a case which occurred in Bengal, and at last it was decided by the Commander-in-Chief there.

7951. (*President.*) Assuming that if it is not the practice, it ought to be, that officers should sit according to the dates of their commissions, excepting in the case of the president, are you satisfied with the relative rank of medical officers, with the exception of the case you have mentioned, that of assistant-surgeon, after five or seven years?—No, I think that a regimental surgeon ought to have the rank of field officer after a certain period of service,—certainly after 15 years.

7952. And a deputy-inspector, what should his position be?—I think that he ought to come within the Royal Warrant of 1854; after three years' service he should get whatever a lieutenant-colonel gets.

7953. In the same way, I presume, you are of opinion that Sir John Hall's rank was not sufficient in the Crimea at the head of the medical department of so large a force?—No.

7954. He held the rank of brigadier-general, did he not?—Yes; most of the officers commanding the brigades were major-generals, indeed all of them.

7955. In the new pension warrant which is published in the Army List, I think there is some error in the relative rank of the officers?—There are some ranks omitted, and some are entered that have ceased to exist; and the sum allotted to medical officers is much below that which is allotted to commissariat officers of corresponding rank.

7956. Is not the difference between the pension granted to the commissariat officer and to the medical officer the result of their having been formerly serving under two different departments, the one being under the Treasury, and the other under the Horse Guards?—I do not know; but the commissary-general, who, by the regulations, only ranks as a brigadier-general, is classed with the major-generals, and he gets 50*l.* more. A deputy commissary-general, if at the head of his department, gets 300*l.*; but in the medical department, if I were at the head of my department, although of the same relative rank as a deputy commissary general under three years service in that rank, I should by that warrant only get 100*l.*

7957. (*Dr. A. Smith.*) Do you know what the pay of the commissary-general is on the field?—His pay is 4*l.* 14*s.* 11*d.*; his war pay is 1*l.* 18*s.* 0*d.*, and his field allowance is 15*s.*; I think 7*l.* 7*s.* 0*d.* altogether.

7958. Do you know the pay of an inspector-general in the field—Sir John Hall?—Yes; I do not think he received 2*l.* a day. There is 1*l.* 18*s.* and 1*l.* 16*s.*, and we must serve one year on each. There was another warrant came out the other day as to lodging-money for chaplains. The chaplain of the forces gets 4*s.* 6*d.* a day lodging-money, and a staff-surgeon of the first class only gets 3*s.*

7959. (*President.*) You are placed in the Army List after the commissariat?—Yes; and they take precedence of us in consequence.

7960. (*Mr. T. Alexander.*) As a medical officer, whatever may be your rank, you only get 1*s.* a day for one servant?—Yes; and a brevet major of the royal engineers gets, I believe, 3*s.*

7961. (*President.*) With regard to the uniform, have you any suggestion to make?—I think that the purveyor's department should have a different uniform, and I know that in the new book of regulations it is so.

7962. As to the commissariat, there is some want of distinction between their forage caps and that of the

medical officers?—I think that their forage cap is too like ours. I am told by commissariat officers that several of their officers were taken for medical officers at the Alma; the wounded seemed very doubtful, and we should prevent any impression of that kind.

7963. Have you any observation to make on the subject of funeral honours?—I think that medical officers should have the same as any other officers.

7964. Have you any opinion as to how the medical staff corps should be formed?—They should be selected from the ranks of the army, I think.

7965. (*Mr. J. R. Martin.*) Did you ever hear of the case of a medical officer at Gibraltar to whom funeral honours were refused, a surgeon of the name of McGregor?—Yes, I did; and I think I have heard that his friends requested permission to bury him privately.

7966. (*Sir H. K. Storks.*) How were they refused?—The Queen's regulation lays down that they are not entitled to those honours. It excludes them. It says that they are to have some honours without firing over their graves. There is a distinction made between a regimental staff and a medical staff assistant-surgeon. As a regimental staff officer he gets the honours.

7967. Is that usage?—No. I can show it in the Queen's regulations.

7968. Where do you show that an assistant-surgeon is to be fired over?—It is laid down in the Queen's regulations.

7969. Do you consider that the honours consist in the firing?—Yes, I think it is an essential part. I think that an officer who is buried without the firing would be considered as in some degree inferior.

7970. (*President.*) Can you state that the practice has been to withhold those honours from staff medical officers?—I cannot say that, for I have known cases where the practice has been different. It depended upon the general-commanding entirely. I know that in the case of the deputy inspector-general at Madras the firing party was the same as for a lieutenant-colonel.

7971. (*Mr. J. R. Martin.*) Did you hear in the case of Surgeon McGregor that Dr. Gilchrist, the inspector-general of hospitals there, in making his will, directed that his remains should be interred in the civil burial ground?—I do not know who the officer was, but I heard that there was such a case.

7972. (*President.*) Do you think that the medical officers should have their servants supplied from the hospital corps?—Yes, in the field particularly so.

7973. Have you any other suggestion to make on the subject of servants?—I think that there was no position in which medical officers were more cruelly placed than we were in that respect in Turkey and in the Crimea.

7974. (*Mr. T. Alexander.*) Ought they not to have an allowance for each servant?—Yes; on ordinary occasions where a money allowance is given, instead of a number of servants given, a difference ought to be made according to the ranks of the officers. An assistant-surgeon and an inspector-general should not be expected to do with the same number of servants. In my own case I was allowed 3s. a day and I paid 6s.

7975. Medical officers having a title to so many servants according to their rank, if they do not obtain those servants from the hospital staff corps, ought they not to have a certain amount of pay for each servant to enable them to get them?—Yes; clearly.

7976. (*President.*) The amount which is allowed did not procure you a servant?—No; we were allowed very liberally for one servant; but having three or four horses to look after, we could not possibly do with one servant.

7977. (*Mr. T. Alexander.*) Are you aware that at one time the rations were refused in the field for the second servant, though it was known he was kept?—No; I think when I joined in the Crimea I paid considerably more for rations for the first servant than for the second, as I received allowance for the first and not for the second.

7978. (*President.*) Have you had any opportunity of seeing how far medical officers are consulted by military officers in command with regard to sanitary questions?—Yes, I always have been very fortunate in that respect.

7979. From what you know, would it be advisable that the military officer should consult the medical officer, and that the latter should give his opinion in writing?—I think that the duties and responsibilities of both should be clearly defined. The medical officer sometimes does not know whether his advice will be taken.

7980. (*Sir H. K. Storks.*) Still you have found military officers ask your opinion?—Yes.

7981. (*President.*) You never knew any unwillingness to do so on the part of military officers?—No.

7982. (*Mr. J. R. Martin.*) There is no regulation to that effect?—No.

7983. (*Mr. T. Alexander.*) As an invariable rule, would you say that they are consulted?—No. I have seen many regiments where I believe the surgeons were not so fortunate as I was.

7984. (*President.*) Do you think, generally speaking, that the regimental medical officer is on a proper footing relatively with the lieutenant-colonel commanding the regiment?—I think so.

7985. Does he report to him, or does he send his reports directly to the principal medical officer?—The principal medical officer is merely his professional superior. Everything is done between the surgeon and the commanding officer. I know that in my case the commanding officer always said that he wished everything to be direct between us.

7986. Would it be advantageous that the medical reports that are made by the regimental medical officer to the principal medical officer should be made through the colonel?—Yes, I think that it might avoid the confusion and many inconveniences that arise. A case occurred in the Crimea with regard to some stretchers, in which there was some misunderstanding. The surgeon of a regiment received a strict injunction from the principal medical officer to have his field equipment ready, and everything in good order for a move that might take place at any time; and acting upon this, when he received a message from the colonel for two stretchers, he did not feel justified in giving them up. At first, I think, a sergeant came, and next the adjutant came, and at last he gave up the stretchers, but he was put in arrest for disobedience of the orders of the colonel.

7987. (*Mr. T. Alexander.*) Are you aware that they were sent for, to be used as a triangle for flogging?—I do not know.

7988. (*President.*) The colonel in that case was not aware of the order given by the principal medical officer to the regimental surgeon?—Probably not.

7989. With regard to the rank of purveyors and their relationship to the medical officer, have you formed any opinion upon that subject?—I think that they should be strictly under his orders in everything as to hospital arrangements and supplies.

7990. You would keep up the purveyors' establishment, and not make it a part of the commissariat?—I think that the purveyors' establishment has this advantage, that they are more immediately under the medical department than the commissariat would be.

7991. Are you aware of the practice in India where it is all done by the commissariat?—It is nominally, not practically so, at least not in the Presidency of Madras; the arrangement there is, that the commissary general advertises for conicopolies one for each European regiment. These men lodge security with the commissary general, and he fixes upon the man whom he considers most efficient and most useful. Having got the securities, he gives over to him the supply for the regiment and the hospital too; his duties as to the supply of the hospital are, that he is to do everything that the surgeon orders; he becomes practically the purveyor, and if everything goes right, there is no communication between the commissary general and the medical officer, but if the latter has

Dr. G. Stewart
Beaton.

8 July 1857.

any reason to complain of the manner in which this man performs his duty, he appeals to the commissary-general who can dismiss him.

7992. You stated that it was important that the purveyor should understand that he was under the authority of the medical officer, is it not so now?—I do not know that they clearly understand that, and I do not think that they submit very generally to it.

7993. A purveyor cannot report home, and he cannot exercise any discretion?—He is ordered to provide things, but he can report what he considers to be an excessive expenditure; but I think he is no judge at all.

7994. You must have some financial check?—I think that the principal medical officer ought to be responsible for that.

7995. (*Sir H. K. Storks.*) The purveyor only reports to the War Office as to the financial part of his duties?—Yes, on the expenditure, if it is too great in his opinion, or more than usual; it need not be excessive.

7996. From your experience of the purveyor's department, have you ever known the purveyor refuse or show an unwillingness to obey the orders of the principal medical officer?—I have known cases where the purveyor has questioned my authority. A case occurred at Balaklava, where one Sunday, after being at church, I went over into the wards of my hospital, which was the general hospital at Balaklava, and I found that some of the orderlies had been employed in scraping the floors; I walked over to the office of the purveyor, and I said to him—it was Mr. Fitzgerald, who took great pains, and every one appreciated his exertions—that I did not wish any extra work to be done on Sunday. He said, "I am not under your orders, sir; I am responsible to Sir John Hall for the state of the hospital." I said, "Will you be good enough to show me your instructions to that effect?" He said, "You are perfectly well aware that I am deputy purveyor-in-chief." I said, "I am, but I am not aware that as deputy purveyor-in-chief you have anything to do with this hospital; you must act under my orders." He did not show me any writing, and I desired the hospital servants to take no orders from him.

7997. Was not the rule in the hospital this, that the purveyor was responsible for the exterior and not the interior?—Yes.

7998. (*President.*) He ought, you think, to be responsible to the principal medical officer?—Practically he should take his directions from him; in many cases, as to washing the floors, the purveyor is not able to judge whether the state of the patients will permit it.

7999. (*Mr. J. R. Martin.*) Should not the relations between the surgeon and the purveyor be in all cases thoroughly defined and understood?—Yes.

8000. (*Dr. A. Smith.*) Were there no special instructions given by Sir John Hall to Mr. Fitzgerald in consequence of its having been found previously that the changes of the medical officers were so frequent, and that they were so occupied in their ordinary treatment of the sick that they really had not time to look to the hospital; and had not Sir John Hall stated to Mr. Fitzgerald that in consequence of that he placed him in charge to look to the cleanliness of the hospital?—There was nothing on record to show that, and there was always a medical officer, for many months a first-class staff-surgeon, specially in charge of that hospital.

8001. You are not probably aware that Sir John Hall wrote to me on that very subject, saying that the medical officers were so much occupied that he found it was difficult to compel them to look after the cleanliness of the hospitals; and as he found Mr. Fitzgerald was an active man, he had placed him in a situation rather different from that of a purveyor, to look after the cleanliness of the hospital?—I think he should have made the medical officer in charge fully aware of it.

8002. (*President.*) Did you ever know a case in which a purveyor made a report against a medical

officer to the principal medical officer?—Yes; a case also occurred at Balaklava, in which I have reason to believe that a report was made.

8003. You do not know it of your own knowledge?—Evidence was taken in the purveyor's office and witnessed by the purveyor's clerk; no doubt it was taken by Mr. Fitzgerald. On this occasion Mr. Jackson had just succeeded to the charge of the hospital. The practice in the general hospital at Balaklava had been to have the beds laid down. Mr. Jackson was a very active and energetic officer. I had not seen the principal medical officer myself. I said, "If you look under those beds I think you will find a deal of rubbish, clothes, and boots; and as the cold weather is nearly over, you had better have all the beds folded up, and have all those things put together and put away in store." It appears that Sir John Hall visited the hospital that day, and these things being about, he seemed vexed to see it so untidy. It appears that he then gave an order—which I was not aware of until afterwards—to Mr. Fitzgerald to assume the charge and the responsibility of the cleanliness of the hospital, and ordered the beds that were not made up to be made up. He mentioned the circumstance to me. I did not clearly understand that he objected to the beds; I thought he wished that we had mentioned it to him before. I said that that was the usual practice at Castle Hill and in the other regimental hospitals. I knew that those beds were made receptacles for a quantity of rubbish, and I had sanctioned Mr. Jackson having them turned up. However when Mr. Jackson went to the hospital in the evening, one of the hospital servants told him that the order was to turn them down. I think he told them to suspend the order until he had seen me or Sir John Hall; and this was considered as disobedience of orders. I know that a report was sent to Sir John Hall, and he wrote down a very angry letter in consequence.

8004. That was a report made by the purveyor?—Yes.

8005. (*Dr. A. Smith.*) He made his report to Sir John Hall, because he had not been permitted to carry out the orders issued by Sir John Hall?—Neither Mr. Jackson nor I had received information that those orders were given to Mr. Fitzgerald. They were mentioned incidentally by a hospital servant to Mr. Jackson.

8006. (*Sir H. K. Storks.*) Were they not put into the departmental orders?—No; it was a mere verbal order.

8007. Had you departmental orders?—Yes; it was a verbal order given to Mr. Fitzgerald, who gave it to one of the hospital servants, who gave it to Mr. Jackson, and Mr. Jackson paid no attention to it.

8008. (*President.*) You were speaking of the degree to which the medical officers were employed at Balaklava; was there much drudgery of an unprofessional character imposed upon the medical officers?—Yes, a good deal; at Balaklava there was the constant auditing of the purveyor's accounts. There was a case occurred to me in which I had to examine 1,000 two-dozen cases of wine, which occupied me and two staff surgeons for two or three months.

8009. On what ground was this duty imposed upon you?—There was some suspicion that this consignment of wine had been tampered with, and that the full quantity was not in the boxes, and I was required to open, unpack, count, repack, and close up every single case of those 1,000 cases.

8010. By whom was that ordered?—By Sir John Hall.

8011. (*Dr. A. Smith.*) Are you not aware that that is an order of the government that there shall be a board of survey appointed?—I received a departmental order from Sir John Hall to perform that duty. The usual way is to select a box here and there and examine it, but this was a special case in which I had to examine every box. I know that Dr. Templeton was constantly employed in auditing the purveyor's accounts.

8012. (*President.*) All those being duties of an unprofessional character, which take a doctor away from his patients, and which might be as well executed by a subordinate officer?—Yes.

8013. Are you aware whether any distinction was made in the distribution of honours between the medical men in the front and those at the general hospitals at Scutari?—There were none given with the exception of Dr. McGregor and Dr. Cruickshank. He was promoted. There was no special promotion except that.

8014. (*Sir H. K. Storks.*) What decoration did Dr. Cruickshank get?—None; but he was promoted.

8015. (*President.*) Men were sent up from Scutari and promoted at the front, were they not?—There was not much interchange; I had to apply specially to be allowed to go up.

8016. Were not there men at Scutari who were promoted into vacancies that occurred in the front?—Dr. Gordon went up and got charge of the second division, in which he continued until the taking of Sebastopol. He was promoted in the front.

8017. No French decorations or any English orders were given to the men engaged at Scutari?—No.

8018. (*Sir H. K. Storks.*) When did you go to the Crimea?—In the beginning of October.

8019. You did not get the Crimean medal?—Yes; but I had to give it up.

8020. Do you know the case of the officers who volunteered into the French hospitals?—Yes. I know that they did so, and I know that they were very specially thanked.

8021. They were eligible for the French decoration of the Legion of Honour?—I should think so.

8022. (*Mr. J. R. Martin.*) With your knowledge of and acquaintance with the officers of your department do you think that it would gratify their feelings and be proper in itself, that their merits should be recorded by the commander-in-chief in his despatches?—Certainly.

8023. Do you consider that a favourable mention by both Houses of Parliament of the services of the medical department after a war would be gratifying to the feelings of the service?—I do. I think it would be just also.

8024. Have you considered the question of such a roster of duties as should elicit the various capabilities of medical officers, and as should show who might be best employed as surgeons, physicians, and administrative officers?—You can scarcely judge while a man is a regimental surgeon; he may show talent in a special way. Many men are excellent regimental commanding officers who might not make good generals; no one can tell what the general administrative talent may be until a man is tried.

8025. Are you aware that in the military states of Europe such an arrangement of duty is in existence among them as shall elicit their peculiar capabilities?—I do not think we can follow that out in our scattered regimental service.

8026. No measures have occurred to you which should better elicit the individual qualities of medical

officers than that which now exists?—No; I think that the present system elicits all that we can in our service reasonably expect.

8027. But the regimental school merely elicits practical medicine and surgery?—In a limited way it elicits administrative talent too. An officer who is moving with his regiment on service may show that he is able to keep up his equipment. In India each regiment moved separately; and while we were on service in the last Burmese war, a good deal depended upon the regimental surgeon and his assistant.

8028. (*Mr. T. Alexander.*) Do you think that if a certain number of honorary physicians and honorary surgeons to Her Majesty were selected from the most meritorious officers in the medical service, it would be considered a boon?—Yes, it would be very gratifying.

8029. (*Sir H. K. Storks.*) How would you select them?—In the same way that I would confer any other reward.

8030. By seniority or selection?—No; that is a mere honorary appointment, and it does no injustice to anybody else.

8031. Do you think that a full-pay retirement to a certain number of old officers would be considered a boon?—Yes, I think it would.

8032. (*Mr. J. R. Martin.*) In such a case as that, would it not be fair to say to a deserving regimental officer, you have got your reward; you are not eligible for the administrative department, and you must be passed over?—Yes; I think it would be showing a fair consideration to a deserving officer who was a good practical surgeon.

8033. (*Sir H. K. Storks.*) Would not a full-pay retirement relieve the list from many old officers who are unfit for active duties?—If they give the full-pay that the officer actually receives. In our regulations the standard is the minimum; we do not recognise the extra pay as pay, it is only as a gratuity. A deputy-inspector's pay is 1*l.* 4*s.*, and with the additional pay it comes to 1*l.* 10*s.*

8034. (*Mr. J. R. Martin.*) Would it gratify the feelings of old and deserving officers if on their retirement they were to obtain a step in brevet rank?—I think so; an honour any step in brevet.

8035. (*Dr. A. Smith.*) Are you not aware that that regulation has been established?—I have seen it lately.

8036. (*Mr. T. Alexander.*) Are you not of opinion that forage ought to be allowed to surgeons without deductions?—Certainly; I never could understand why a surgeon should be required to pay for forage.

8037. If full-pay retirement were given to a certain number of old officers, would you give it merely to the executive or also to the administrative branch?—I would give it to the executive who were really deserving officers, and who had been unfortunate—men who had not got promotion but against whom no one could say anything. I contemplate that some officers might be passed over because they were not eligible.

*Dr. G. Stewart
Beatson.*

8 July 1857.

The witness withdrew.

Adjourned to Friday next at One o'clock.

Friday, 10th July 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Sir H. K. STORKS, K.C.B.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

JOHN ROBERT TAYLOR, Esq., examined.

John Robert
Taylor, Esq.
C.B.

10 July 1857.

8038. (*President.*) Have you considered the rates of pay which are now allotted to each rank in the medical service?—Yes, I have.

8039. Do you think that they are sufficient?—I think not.

8040. In what ranks do you think that the pay is not sufficient?—In all ranks. I have a paper in which I, in common with some others, have put down what we conceived was required as to pay, and if the Commissioners please, I will hand it in as an answer to that question and also as to the half-pay.

8041. Have you made any calculation of the increase of expense that would result upon the existing establishment by the alteration in the rates which you propose?—No, I do not feel that I have the means to make such a calculation as that; in regard to the table of half-pay, the quinquennial period might, with advantage, be carried out.

8042. Instead of the decennial period?—There is no such division of the period from ten to twenty years, otherwise it is a quinquennial period.

8043. But as in the existing rates, there are periods of ten, or periods of five years?—I think it varies.

8044. Do you propose to make it five years in all cases?—Yes.

8045. And the increase of pay in the same manner?—No, it is not exactly in that way. I cannot say that there is any definite rule with regard to this, but we merely consider, taking each rank, what should be the pay of that rank.

8046. Do you not think that it would be an advantage, supposing it were so adjusted, that there should be no difference in the point of expense, and that the rises in pay should take place at shorter intervals than at intervals of ten years?—I think so. As it at present stands, the first increase of pay for an assistant surgeon is after ten years service, when he receives an additional 2s. 6d., making his pay 10s.; but if he has become surgeon his pay is 13s. or 15s., if he has already served two years on 13s. There is no further increase of pay in this rank till after 20 years service. Practically there are no regular intervals for increase of pay.

8047. Where there is the difference of pay between the ranks, that cannot be helped?—At present it is impossible to say how the pay runs. As I said before, I got promotion without any increase of pay.

8048. You do not get an increase of pay now the first year that you serve?—Not for the first two years. I came home from India as the surgeon of the regiment, and I was promoted on my way home. I saw the Gazette, but when I came home I got no increase of pay as staff-surgeon of the first class. I got exactly the same as when I was regimental surgeon. During the whole time that I was staff-surgeon of the first class I had no increase of pay. Then when I was promoted to the rank of deputy-inspector I was serving on the pay of a deputy-inspector under 20 years' service, when I was actually over 20 years' service. I served three years over 20 at the pay of my rank under 20 years.

8049. Does not the variation of pay in the rank of deputy inspector depend upon the length of service in the rank, or upon length of service from the date of first entry?—The date of the first entry as well as in the rank. When I came home I wrote to Sir John Kirkland—I did not think that he was right in giving me the same pay after promotion, and he explained the regulation,—the regulation was that you must complete two years on the minimum rate of pay in that rank if you have not had two years of that pay in your former rank. The evil and the injustice of that is marked in this way: When I was promoted to staff-surgeon of the first class there were two officers in the same Gazette, one senior and one junior; the junior surgeon being on 15s. a day, and being promoted to staff-surgeon of the first class, he, with the promotion, got an increase of pay of 4s. per day, whilst I, with nearly two years longer service, got no increase.

8050. Promoted to the same rank?—Yes; and the promotion gave him an increase of pay of 4s. a day.

8051. Why?—Because he was a regimental surgeon on 15s. a day, whilst I being a regimental surgeon from length of service on the 19s., promotion gave me nothing.

8052. On the other hand, you had been better off before than he, you had come to the same rate of pay, but it was a greater rise to him than to you?—Yes; but that favoured the junior; whereas the man who has been unfortunate in his promotion, does not get an increase till late, while another gets an increase of pay very early.

8053. You had the advantage of him in the previous rank?—I had been longer in the service and I was entitled to it.

8054. (*Sir T. Phillips.*) It is not the grade that gives an increase of pay, but it is the length of service?—It is both.

8055. (*President.*) The amount of pay depends upon the rank, but the increases of pay within the rank depend upon the length of service?—The amount of pay does not depend upon the rank altogether. I was serving in the Crimea with a staff-surgeon of the first class in a rank junior to me getting the same pay as I did, 24s. a day.

8056. He was junior to you?—No; he was many years senior in the service, but junior in rank, and getting the same pay. It told in one way, and not in another; here was a staff surgeon serving with me—he was senior in the service, and perhaps on that ground it was fair that he should have an equal rate of pay, though I was senior in rank. We each got 24s. But then I turn round and see a junior man in the service of the same rank getting the same pay.

8057. With regard to half-pay, is the amount that you propose governed by any relative proportion to the full-pay in the different ranks?—No; it is not.

8058. What is the principle upon which you propose that?—There is no regular principle—it is arbitrary, but it is arranged so that a man shall

have an increase according to service, and according to rank.

8059. Does the seniority of service interfere with the seniority within the ranks as regards half pay as well as full-pay, and is the half-pay adjusted upon a mixture of both principles?—I am not sure.

8060. If the whole cost of the changes which you propose appear to be a very large annual increase of charge, do you attach as much importance to the increase of half-pay as you do to that of full-pay?—It depends upon the rule of being put upon half-pay very much. I think it hard for a man on reduction to be reduced to the present half-pay.

8061. Reduction only occurs at the termination of a war, and it is, therefore, an event of very rare occurrence. When did you enter the service?—In the year 1833.

8062. You have seen but one case of reduction?—No; now and then a man is put on half-pay on account of sickness, it would be a hard case then.

8063. If only a certain sum can be awarded in augmentation of the emoluments generally of the army medical department, would you not sooner take the whole of it for a full-pay than meddle with the half-pay at all?—Yes, if coupled with a compulsory retirement.

8064. Supposing you can have but a half loaf, which half would you have, the full-pay or half-pay?—I would improve the full-pay on the above specified condition.

8065. Have you any other observation to make on the subject of pay?—I think that where a man in a particular rank falls into the charge of a superior, he should get something for that charge. For instance, when I was staff-surgeon of the first-class at Chatham, on 19s., I was doing the same duty a great part of the time as I do now, but I got nothing extra for it.

8066. You were acting deputy-inspector?—I was doing the duty of that rank.

8067. (*Sir H. K. Storks.*) Were you the principal medical officer?—Yes, and I had all the trouble of the reception of the first wounded. I was there for three months or more as principal medical officer, but I got not one shilling as such. Any military officer, a colonel of a regiment who is made a brigadier gets something very considerable extra.

8068. Would you extend that to all first-class staff surgeons on the different stations where they perform inspectorial duties?—I would give every man a charge allowance.

8069. But there is a charge allowance for performing inspectorial duties on foreign stations?—Yes; that does not apply to Chatham, which is the most onerous station. My predecessor had an allowance of 10s. a day. I do not know why it was not given to me.

8070. There is a note at the bottom of page 46 of the "War Office Regulations":—"In addition to the pay of their ranks, the officers at the head of the medical department on foreign stations shall receive allowances at the under-mentioned rates, when serving under the following circumstances, viz.:—If with an army in the field of 10,000 men, or upwards, 20s. per day. If with an army in the field of 5,000 men or upwards, 15s. per day. If with an army in the field of any less number, 10s. per day. If serving in a colony where the forces consist of 1,500 men or upwards, 5s. a day?"—Yes; but that does not apply to Chatham.

8071. (*President.*) What excess of pay does your scale give over the existing pay in the different ranks?—It would vary in the different ranks.

8072. What increase do you give to an assistant-surgeon?—We make his pay from 7s. 6d. to 10s. on first entry.

8073. (*Sir T. Phillips.*) Has he any rise at five years?—Yes; by the scale proposed he would receive 11s. 6d. at the end of five years, and 13s. at the end of ten years. At present the first pay of a surgeon is 13s., it is proposed to make it 17s. 6d., with an increase every three years up to 24s.

8074. (*President.*) Instead of what?—I cannot say what it is instead of; it would depend upon length of service and other circumstances.

8075. (*Sir H. K. Storks.*) What does he get under similar circumstances according to the existing warrant?—He must commence and serve two years on 13s., he then gets 15s. if over ten years total service. There is then no increase till after twenty years total service, when, if he has served two years on the 15s. he gets 19s. Then after twenty-five years' total service he receives 22s., provided he has completed two years on the 19s. There is no further increase in this rank.

8076. (*President.*) Do you propose to do away with everything but length of service in the rank in adjusting the increases of pay?—I propose that the increase of pay shall follow the order laid down in these tables; it is a gradual rise of pay with rank; the rates do not run into one another as they do at present.

8077. Do you intend that increase of pay to be after so many years service within the rank?—Yes.

8078. (*Sir T. Phillips.*) Do you say that you propose an advance in the pay of a surgeon at the end of three years?—Yes.

8079. Why do you depart from the quinquennial period for advancing the pay in the case of the surgeon?—The surgeon has the greater increase; it is the more important office.

8080. Why select three years there?—There has been no system adopted; it has been an arbitrary increase; it seemed to satisfy most parties.

8081. (*President.*) In the pay of the first class staff surgeon, what difference do you make?—The first-class staff surgeon commences on 25s.; he may have commenced at present on 19s., and there is a difference of 6s.

8082. (*Sir T. Phillips.*) You say there is no principle in the selection of the scale of three years in one instance and five in the other?—No regular system.

8083. (*President.*) Do you give a similar increase to the deputy inspector?—He commences according to this on 32s., or 2s. more than a staff surgeon of the first class. When he is promoted he gets an increase of 3s. at three years, and 2s. 6d. at the end of six years.

8084. What does he get now?—That depends upon his previous service. I am getting 28s.

8085. Have you any other observation to make on the pay?—No; this table contains my ideas as to pay.

8086. Have you likewise put on that paper your ideas as to half-pay?—The only alteration in the paper that strikes me as necessary is applying the quinquennial period throughout the scale of half-pay.

8087. As to retirement have you included in that scale retirement?—Yes, on reduction and on retirement; the half-pay table contains two lines in one page, one for retirement and one for reduction.

8088. Which is the highest?—The reduction.

8089. Do you propose any compulsory retirement?—Yes.

8090. In what rank?—We propose a compulsory retirement at 35 years service irrespective of rank.

8091. At rates varying in each rank?—Rates varying with the rank according to the scale.

8092. Have you optional retirement besides?—Yes, at 20 years and 25 years and 30 years; there is no increase of retirement after 30 years; it is compulsory at 35. That is what is proposed in this paper.

8093. Do you make the retirements which are not compulsory optional with the officer, or only permissive?—Optional.

8094. An absolute right in all those cases?—Yes, to retire at those different intervals.

8095. At present retirements are not optional?—So far retirements are not optional, that they require the recommendation of the director-general.

8096. And the assent of the director-general?—The recommendation of the director-general.

John Robert
Taylor, Esq.
C.B.

10 July 1857.

8097. With regard to the first-class staff surgeon, do you hold that that should be an executive or an administrative rank?—An executive rank; it will in some cases be administrative, but as a general rule I hold that it is an executive rank.

8098. If only to be an executive rank, what is the advantage of having the rank at all, since the duties would become the same as those performed by a regimental surgeon, and a second-class staff surgeon?—The duties are different. At Chatham there are two first class staff surgeons, and each has charge of a division.

8099. Are they executive?—Yes, and in some measure administrative; they have a charge, and they have a special duty as to invaliding.

8100. They are sub-inspectors to you?—Yes, they are.

8101. They have professional charge of the wards, have they not?—Yes; and they are responsible for the due treatment of all the cases in their division.

8102. Have they practically the treatment of patients?—Yes; they have, and they perform operations. If you placed their duties in the hands of surgeons, there are a great many more of the rank of surgeon at Chatham, than of the rank of staff surgeon of the first class—and those charges would be perpetually changing with the changes of the surgeons, and cause a great deal of inconvenience. The charge would fall always to the hands of the senior surgeon in his rank, in which the changes at Chatham are very much more numerous than in the first class. I look upon first-class staff surgeons sent to Chatham, as fixed there for two or three years.

8103. There being fewer stations at which a first-class staff surgeon can be appointed, his roster of service comes round less frequently?—Yes.

8104. (*Mr. J. R. Martin.*) Are his services attended with the same conveniences at other stations?—I can hardly speak for other stations.

8105. (*Sir T. Phillips.*) What is the advantage of maintaining so many grades in the Army Medical Department as contrasted with the navy, where you have only the assistant surgeon and the surgeon?—I think a true series of gradations is very essential to discipline and the systematic working of the department.

8106. What is the advantage of having more than two grades, that of surgeon and assistant-surgeon, for executive duty?—I explained that at Chatham if you had not staff surgeons of the first-class in charge of the divisions, or a rank senior to that of regimental surgeon, the shifting of the charge would be so frequent as to cause great inconvenience.

8107. That is because the staff surgeon performs there certain administrative duties?—He has certain special duties not exactly administrative.

8108. What are they if not administrative?—He examines men particularly with reference to their fitness or unfitness for service; he has them under observation in his division, he forms an opinion upon them, and writes it in a book. When a man comes before me my decision is final. I refer to the staff surgeon's account of him while under his observation.

8109. Is there any other reason than that at Chatham?—There is a large number of young men entering the service, and he has to teach them their duties.

8110. Leaving Chatham as a special case, is there in the general administration of the Medical Department in the army any advantage in having more than two grades, namely, the surgeon and the assistant-surgeon?—As regards the medical treatment of cases I do not think so; but as to the system of working a hospital I rather think there is.

8111. In what way does the division into the existing grades enable you to conduct the business of your profession better in the field or at home?—Take a very large hospital with 500 or 600 men, and place a deputy-inspector at the head of it, you must sub-

divide it, before the deputy-inspector can have any system of inspection at all. Then I say, if you give a division to the senior surgeon, you must either give him double duties, or relieve him from one duty to do the other; in that way you make the first class staff surgeon.

8112. Why in military life does it seem to you necessary to have for the treatment of disease those different grades?—It is not for the treatment of disease, it is for the military duties of the hospital. He has at Chatham professional duties. He is held responsible for the treatment of all cases that he has under him.

8113. (*Mr. J. R. Martin.*) He performs medical duties administrative and executive at Chatham?—Yes.

8114. (*Dr. A. Smith.*) Have you any staff surgeons of the first class as executive officers anywhere else but at Chatham?—I am not aware how you employ them.

8115. (*President.*) What duties did they perform at Scutari?—I was not there; I cannot say. I fancy that staff surgeons of the first class performed operations in their divisions.

8116. (*Mr. J. R. Martin.*) Besides the duties of inspection?—I did not think that their duties were inspectorial.

8117. (*Dr. A. Smith.*) Are you not aware that every staff surgeon of the first class at the present moment, save the two at Chatham, are performing administrative duties?—No, I am not aware of that.

8118. Is not it your belief from what you know of the service?—I should not call it their duties in any recruiting district, for instance.

8119. In all stations where a staff surgeon of the first class is placed, except at Chatham, do you believe that they are doing executive duties?—I do not know where they are employed. I thought that they were principally on recruiting districts.

8120. (*Sir T. Phillips.*) Supposing the staff surgeon of the first class to be really and ordinarily limited to administrative duties, would not it be better that some other distinction should be given to him than the name of staff-surgeon?—I disapprove of the present names and styles of our ranks.

8121. (*Mr. J. R. Martin.*) You would call him a deputy inspector?—I would call the staff surgeon of the first class a brigade surgeon. I look upon that as the extent of his charge.

8122. (*Sir T. Phillips.*) What you want to show is that his duties are not so much those of a surgeon as of an administrator in the medical service?—I think he is a sort of consulting surgeon in his division; there is one below him. We look to him at Chatham to regulate the diet rolls, and not to allow the old soldiers to persuade the young officers to give them anything they may fancy.

8123. What is the advantage of having regimental surgeons and staff surgeons of the second class rather than calling them surgeons?—I do not know.

8124. Why not call them surgeons and appoint them either to regiments or appoint them to the staff service as may be needed either for the one or the other?—A man is a regimental surgeon or a staff surgeon.

8125. Is there any distinction except in the words used between a regimental surgeon and staff surgeon of the second class?—No, they are exactly the same in every respect.

8126. (*Sir H. K. Storks.*) In fact, the second-class staff surgeons are supernumeraries on the station, and available for any duty that they are required for?—I should imagine that they have the staff duties of the station.

8127. Suppose a regimental surgeon is sick, you would put a staff surgeon of the second class in charge of the regiment, would you not?—You may.

8128. (*President.*) If the rank of first-class staff surgeon was done away with, you would require a

larger number of deputy-inspectors to be appointed throughout the different stations?—I should say so.

8129. At present, do you understand that it is a mixed grade, partly executive and partly administrative?—Yes.

8130. That is the advantage you see in its retention?—I think it is a sort of transition grade—he is available either way.

8131. If it could be shown that they are purely inspectorial, you would not attach the same importance to the rank?—No.

8132. In the naval service there are four ranks, are there not?—I am not aware.

8133. In the Indian service there are four ranks, are there not?—Yes.

8134. In our service we have director-general, inspector-general, deputy-inspector-general, first-class staff surgeon, surgeon, and assistant-surgeon; six ranks?—Yes.

8135. (*Sir T. Phillips.*) In civil life, take the civil hospitals, we only know of three grades, which unite the consulting officer, the surgeon or the physician, as the case may be, and the assistant-surgeon or assistant-physician?—I think it is entirely a matter of military economy. If you do away with staff-surgeons of the first class there are many stations where you would not employ a deputy-inspector. You would take the senior surgeon, and the surgeon of one regiment interfering with the duties of another is disagreeable, yet it would be necessary.

8136. (*Mr. J. R. Martin.*) Would there not be a disadvantage in so many of the inspector's class being relieved from executive duties?—I think that the staff surgeon of the first class should be employed as an executive principally.

8137. Would it not be an advantage to have a deputy-inspector occasionally employed in the treatment of the sick?—I think it would.

8138. (*President.*) There is very great difficulty in making promotions from one rank to another in a way that satisfies the officer of the department?—Very great difficulty.

8139. Is not every increase in the numbers of the ranks an augmentation, by the more frequent recurrence, of that difficulty?—Yes; on the other hand, a man remaining on the same rank long gets discontented.

8140. But he does not get discontented with an equal prospect of promotion to rank and pay?—He gets discontented at remaining very long in the same rank; he finds men in other departments stepping over his head, and occupying higher positions, which is unpleasant. If a man remains long as the surgeon of his regiment he will find a boy ensign become his commanding officer.

8141. If you made this regulation, that after 12 years' service, a regimental surgeon should have a small increase of pay, with the title of surgeon-major, would that meet the difficulty?—I do not think it would.

8142. Not so far as the inspectorial duties were concerned, but it would as far as the executive duties were concerned?—I do not think it would. A man would still be a regimental officer.

8143. Admitting that it would operate prejudicially so far as inspectorial duties are concerned, so far as the executive duties are concerned it would make no difference, would it?—No; not as regards the regiment; as surgeon-major he would do the same professional duties.

8144. Is there not this disadvantage at present in the maintenance of the rank of first-class staff surgeon, that the director-general in selecting for deputy-inspectors has a very limited field to select from, not above 40, whereas if he selects from the whole rank of regimental second-class surgeons he has a wider field from which to choose?—Yes, I do not deny that, but it would alter the whole principle of promotion.

8145. Why so; the principle of promotion is to promote from the rank of surgeon to first-class staff surgeon by selection; and again from first-class staff

surgeon to the rank of deputy inspector and inspector the principle would remain the same?—It would enlarge the field of selection.

8146. How would it alter the principle?—It would make such an extensive alteration that I can hardly see the bearing of it.

8147. (*Mr. J. R. Martin.*) Would it not be an advantage to enlarge the field of selection?—I am not sure.

8148. (*Sir T. Phillips.*) Those from whom the selection was to be made would think so?—I think it would open the door to increased discontent.

8149. (*President.*) Are not the first-class staff surgeons now taken by selection?—I am not aware how they are taken. I can detect no system. That is a cause of discontent, that no man can detect any regulated system.

8150. Is it not professedly by selection?—I am not aware. I cannot answer that question.

8151. From the next rank from the first-class staff surgeon to that of deputy-inspector, is not that by selection?—I cannot say whether it is or is not.

8152. (*Sir H. K. Storks.*) If it is not by seniority it must be by selection?—No, that does not follow. I can find other reasons. Dr. Smith may say,—Here is a man, he is at hand, I want a deputy-inspector, therefore I take him. You may say, that you select a man on account of seniority, but that is not selection. What I understand by selection is superior merit.

8153. (*President.*) Making this distinction that selection is selection for merit, or for the convenience of the service, irrespective of seniority, then should you not say that in the two inspectorial ranks, promotion goes by selection?—I do not understand selection for the convenience of the service; I would limit selection to merit.

8154. You may have circumstances in which it is necessary to send officers with superior rank, say to the Crimea, immediately, and you would take a man under your hand, rather than wait for another?—I should say that he was promoted as a matter of convenience, there is no selection. You take him because he is at hand.

8155. (*Sir T. Phillips.*) But there may be ten men at hand?—Yes; then it is a mixed case.

8156. (*Mr J. R. Martin.*) Does the doubt on your mind as to the ground of promotion arise from the absence of the publication of the rules of the service?—Partly that, and partly because I have never been able to detect any system.

8157. (*President.*) There is no promotion warrant, is there, for the army medical service, as there is for the combatant officers?—I am not aware of any.

8158. (*Sir T. Phillips.*) Would it be satisfactory if the reasons were made public, upon which any appointment other than that by seniority is made?—I think any defined system would satisfy the medical officers, so that a man could see his way in the service.

8159. Supposing a departure from the rule, if a record of the grounds of that departure were made at the time, would that be an advantage?—I think it would satisfy us.

8160. (*Dr. A. Smith.*) You complained just now that there was no rule that enabled any one to judge how promotion was carried on. I think that you were principal medical officer at Chatham when the last general promotion took place in reference to the inspector-general, two or three of whom, who had served the period of three years, were necessarily to be placed on half-pay; there was a paper on that occasion sent up from Chatham to a gentleman in my office who brought it to me as an amusing thing, to show that the arrangements in reference to what the promotions would be were all laid down by the medical department at Chatham. That paper was shown to me. I had not given the subject the slightest consideration at that time, and I did go into it, still there was only one error in the statement that came from Chatham. The promotions took place according to the statement that came from Chatham without my having had any

10 July 1857.

reference to that, yet there must have been some good rule to enable the officers there to point out the succession in nine promotions?—I am not acquainted with that. I have been trying lately to discover what are the various circumstances that govern promotion. I have made a memorandum here of what are the different circumstances affecting promotion. I collect from Dr. Smith's evidence before Mr. Stafford's committee that the various circumstances are, seniority in the service, seniority in the rank, next seniority on the station. Then there is a circumstance affecting promotion, namely, taking a cavalry regiment, that is a bar. Then there is merit and there is selection. Then there is the regulated period of service in one rank before promotion to the higher. Then there was a rule adopted by Dr. Smith as to promotions in the Crimea which is given in Appendix 4, page 320 of the Report of Mr. Stafford's committee. Then Dr. Smith also promoted because men were at hand; sickness is a circumstance obstructing promotion. Then there were promotions with which he had nothing to do; then there are various combinations of those circumstances; and with all those circumstances it is impossible for a man to trace any regulated system among so many reasons for promoting.

8161. (*Mr. J. R. Martin.*) They are well calculated to conceal the reason for promotion?—I think that a man may be promoted and a reason be found afterwards.

8162. (*Dr. A. Smith.*) Will you state the reason why you were promoted, as a junior assistant, over the heads of a great number of seniors?—I was promoted as a matter of interest. Lord Hill did it to oblige Mr. Guthrie. I forgot to include interest in my detail of circumstances affecting promotion.

8163. Was it done in opposition to the head of a department?—I am not aware. Sir James Macgrigor must have sanctioned it.

8164. (*President.*) That does not follow?—I understood it was so.

8165. You find all these various elements in the promotion of the medical department referred to in the evidence of Dr. Smith?—Yes, I find all of them there.

8166. Then there is promotion by stations, the stations consisting of groups of stations formed for the purpose of promotion by the director general, but they are not promulgated, and therefore, officers of the department however fairly promoted according to those rules, are not aware of the rules which have governed the selection or promotion?—Precisely.

8167. Therefore, if the rules were simplified and published, and every man knew the exact reasons for the promotions that took place, though the regulations might press hard upon individuals, there would be greater satisfaction than now?—Quite so.

8168. In the particular case of districts of promotion, they are generally aware of the fact of there being districts of promotion, and the limits of the districts?—I do not think that they are aware of the limits. I could not define them myself.

8169. (*Sir H. K. Storks.*) Are there no written regulations on the subject?—None that I know of.

8170. (*President.*) You do not think that men are promoted except according to those regulations, which, though they exist, are not promulgated, for instance, in a district the senior within it is the person who gets the promotion on a death vacancy?—There is great discontent on the subject, that is all I can say.

8171. There is discontent on the subject. Is not that founded on their not being aware of the extent of those districts, or of the rules applying to them?—Yes.

8172. (*Mr J. R. Martin.*) Have you any reason to suppose generally, that the discontent of which you speak is well grounded?—Yes; I have reason to suppose so. There was a principle of promotion which I find Dr. Smith notices

in his examination, and which I should like to refer to. There are three places in this book where he lays particular stress on the fact that if a medical officer was especially recommended by the head of his department, and by the general commanding-in-chief of the army, that that promotion was carried out as a matter of course. I have good reason to believe, for I was told so by Sir John Hall, that my promotion was so specially recommended; but it did not take place. When I returned home, I asked Dr. Smith the reason why it had not taken place, and Dr. Smith first told me, that the special recommendation had never reached his office. I believe it did. I think that Dr. Smith found it afterwards.

8173. (*Dr. A. Smith.*) If that recommendation never reached me, do you consider that I did you any act of injustice?—I was in the office when you rang the bell, and asked if it ever did reach you, and a man brought it to you.

8174. You were not recommended for promotion, but with a great number of other officers as deserving of consideration?—Sir John Hall told me that he recommended me for promotion.

8175. (*Sir H. K. Storks.*) Promotion to what grade?—Promotion to the higher grade of inspector-general. The local rank of inspector general was what I understood I was to get.

8176. (*Dr. A. Smith.*) Are you aware that I made an effort at the termination of the war to get three officers of each grade advanced a grade as a reward for service generally in the medical department of the army in the Crimea, but I was refused it; and that it was given only to one of each grade?—I was not aware before of that. You told me that you would ask for two promotions and that promotions had been made without your mentioning the names.

8177. (*President.*) As you understand the theory of foreign service, does it go by roster?—I am not aware of any roster.

8178. As Dr. Smith states, you were recommended for consideration; favourable consideration meant a good station or any advantage of any kind, that would be incompatible with the existence of a roster by which each officer should go to foreign stations in his turn?—I understood Sir John Hall to say that I was recommended for promotion, not for anything else.

8179. You were speaking of a case before this in which a surgeon had been appointed over the head of a senior assistant-surgeon coming from another station: what case was that?—Mr. Murphy's case.

8180. What was that case?—Mr. Murphy was assistant-surgeon in the 80th regiment, in which I served as surgeon in Burmah. Mr. Murphy accompanied Sir John Cheape on an expedition to Donabew, where there was an immense deal of sickness, and some smart fighting. Sir John was highly gratified by the way in which Mr. Murphy performed his duties, and he mentioned him in his despatch. Mr. Murphy was recommended afterwards for promotion, and, I believe, the reply from Dr. Smith was, that he was quite aware of Mr. Murphy's merits, and that when his promotion could take place without injustice to officers who were senior to him it would. I think nothing more transpired till Mr. Murphy was coming home, when he found that a junior assistant staff surgeon was promoted over his head, in his own regiment.

8181. Into his own regiment?—Yes.

8182. Was he on the same station?—I should imagine so; he was on the same station as his regiment. I have Mr. Murphy's complaint in his own words:—"Since I wrote to you last I had a reply from Dr. Smith to my application to have my commission antedated, he says he regrets that it is out of his power to comply with my request. The promotions on the 24th February and 3rd March, were consequent on the outbreak of the war with Russia, and, as you were, until your arrival in this country,

"considered on the Indian establishment, and eligible for promotion in that command, you had no claim to advancement at home on the score of seniority until you landed." I have sent him a reply to this, and stated that the promotion of which I complained, and by which I considered myself slighted, was that of one officer, six months my junior, who was put over me in the regiment in which I was serving, this being, as far as I knew, a singular instance of such a promotion, namely,—an assistant-surgeon, junior to one of the assistants of the regiment, being promoted to the surgeoncy of that regiment in which the senior was serving. Further, the 80th regiment being on its return from India was not likely to be sent immediately to the seat of war, and therefore the outbreak of war could not have necessitated such a step. If I was considered on the Indian establishment I should suppose that the regiment which I was serving in and accompanying would also be in the same roster, and when a vacancy occurred in it, that if not given to the senior assistant-surgeon in India, I was entitled to it, being senior to all the assistant-surgeons at home. I also added that the promotion of assistant-surgeon Irwin into the 80th regiment caused much surprise at the time and inferences unfavourable to me were made from it, which I submit is a hardship independently of the loss of time and of having so many juniors passed over my head."

8183. (*President.*) That being a rank in which the rule is that promotion goes by seniority on the station?—Yes, that is one rule. There are several rules.

8184. (*Sir T. Phillips.*) By the Indian establishment is the Indian station meant there?—Yes, it means the Indian command.

8185. So that it forms a station for the purposes of medical promotion?—I think it is all on the other side of the Cape. Mr. Murphy felt it very bitterly and does to this day feel it very bitterly. He had been specially recommended.

8186. (*President.*) I understand that your view is that in the ranks in which promotion goes by seniority it should be seniority in the army list without any reference to any other circumstances except unfitness?—Yes, strict seniority in the service.

8187. (*Sir H. K. Storks.*) In promotion generally seniority in rank or seniority in service?—Strict seniority would imply both.

8188. (*President.*) In the first rank from assistant-surgeon to surgeon you would have it by seniority in the service?—Yes.

8189. Then they would stand in the rank of surgeon; seniority in the rank and seniority in the service would be identical in the surgeons' rank?—Yes.

8190. When you pass from surgeon to first-class staff surgeon, or supposing that rank did not exist to deputy-inspector, how then?—I would carry seniority through all the ranks.

8191. To what would you trust to render the rank sufficiently youthful for the discharge of their duties in the upper classes?—I think that compulsory retirement would have that effect.

8192. It would have that effect if you could carry it to such an extent as to reduce the number in the upper ranks, but that would lead to such an increase of expense as the Chancellor of the Exchequer never would allow?—I would not do away with selection altogether; but selection should never lead to promotion in the department, not regimental promotion.

8193. Would this meet your view that there should be strict seniority up to the rank of surgeon in all the executive ranks, but that the promotion to inspectorial rank should be by selection, with reasons assigned, as in the case of a colonel made out of his turn a major-general?—I do not think that many could complain of that system. I do not know how it would work.

8194. You would like to do away with all the intricacy of the double way of reckoning seniority by rank, and by service; and do away with all the separate stations within which seniority alone should count?—Yes. I am an advocate for seniority; not

that I think it an unobjectionable rule, but it is the least objectionable.

8195. If you had strict seniority, how would you reward distinguished merit?—By various methods, such as local rank, with the pay of that rank, or good conduct pay.

8196. That would only be a temporary advantage?—You may transfer a man to a good conduct pension, as is granted in the military department.

8197. As to local rank, is it not found that in the combatant ranks of the army, local rank is given for the convenience of the service, and not as a reward to the individual?—I think it is given very often as a reward.

8198. You employ a colonel in the rank of major-general, as he is the man for the objects of the service that you want to employ?—But the major-general commanding my division had local rank given him, and he still remained in command of that division.

8199. (*Sir H. K. Storks.*) But it was only temporary?—But he drew double pay and allowances during the whole time he was there.

8200. (*Mr. J. R. Martin.*) How do you think that an absolute rule of seniority will answer for the advancement of medical science, and for the good of the soldier?—I do not say that the seniority rule is unobjectionable.

8201. (*President.*) It is unobjectionable to individuals, but not unobjectionable with regard to the service if you get by seniority some of the least efficient men at the top of the promotion? A man may be a good surgeon, because he understands the treatment of disease, but will that make him a good deputy-inspector; are those the grounds on which you would choose him?—I think the duties of administration are not so difficult that seniority will not produce men that will perform them.

8202. If you select out of 100 men it is 99 to 1 against the seniority falling upon the best man, is it not?—Yes.

8203. If it is selection, supposing a man makes nine mistakes before he gets to the right one, it is only 10 to 1 against his getting the best man?—If you have 100 men to select out of you might just as likely be wrong.

8204. Not so likely to be wrong as when you take seniority?—Unless you give me the grounds on which you would select I cannot say.

8205. You may say that in the whole rank, take deputy-inspectors for instance, there are some men superior to others; a man may be a good surgeon, if he can treat and cure disease well, but you may think that he would not be a good administrative officer?—Then his merit in one rank is a disqualification in the other.

8206. If that has been the rule in the service there is nothing unjust in it?—I think a man should advance gradually.

8207. Whether he is right or not?—No.

8208. (*Sir H. K. Storks.*) Do not you think that public opinion stamps a superior man and marks him out?—I do not think that public opinion reaches us.

8209. I mean public opinion in your own department as medical officers of the army, do not you think that A is known to be superior to B?—Yes.

8210. (*President.*) Do not you report to the director-general that such and such officers are superior men, that such and such officers are average men, and such and such are indifferent?—Yes.

8211. You have the means of knowing that, and could not you form a selection from those men on these grounds?—I think so.

8212. If you could, why could not another man, who has the advantages of the same observation?—If a man appears to be an indifferent medical officer I should report upon him as a medical man; I should not report upon him as to what sort of an administrative officer he would make.

8213. Could not you on the same ground tell which is the man who seems to have the most tact, the most power of command, and the most methodical habits of

John Robert
Taylor, Esq.

John Robert
Taylor, Esq.,
C.B.

10 July 1857.

business?—I know one instance of a man in the administrative department who did uncommonly well, and satisfied the government in a very onerous position, and to my certain knowledge he hated his profession.

8214. Have you not known instances of men taken by seniority who have been quite unfit for the position they occupied?—I admit it.

8215. (*Mr. J. R. Martin.*) Are you not aware that the most eminent medical officers who have ever served in the British army, Drs. Robert Jackson, William Fergusson, and Henry Marshall, most emphatically scouted the ground of promotion by seniority, and furnished reasons for that, in order that there should be no mistake?—But those were in the days when they continued as medical men in all ranks. I am a medical man, but I have very little to do now in the way of my profession.

8216. (*President.*) You would recommend for selection from the rank of assistant-surgeon to surgeon, but you would make the promotion to the inspectorial ranks by seniority?—Amongst assistant-surgeons, if a man is a good man, showing tact in the treatment of disease, I can see why he should be selected for a surgeon, but because he has that tact in the treatment of disease, and has acquaintance with anatomy, I do not see any reason in that why he should be made a deputy-inspector.

8217. If by changes made in the promotion, the administrative officers were relieved of a great deal of the drudgery of household details to which they now are subject, and their position, therefore, became much more purely professional than it is now, would not their medical and surgical skill become a greater element in the selection of officers to the upper ranks?—I think it would.

8218. Then selection would become more easy?—Selection would become far more easy.

8219. As a general rule, though occasionally men very eminent in their profession have not made good administrative officers, have not the best surgeons, taking them in the mass, been afterwards distinguished as administrative officers?—I could not answer that question.

8220. (*Mr. J. R. Martin.*) What are you afraid of in seeing the principle of selection applied to promotion in the medical department?—I am not afraid of it, but I do not see the ground on which you would select; you would say that a man is a good surgeon who is thoroughly acquainted with the various branches of his profession, but what have they to do with administration?

8221. (*Dr. A. Smith.*) Does not it often occur in the West Indies that a regiment is stationed where there is an epidemic, say of yellow fever, breaks out, and are there not opportunities to see what arrangements the surgeon makes, so as to enable the principal medical officer to discover if a man is fit for administrative as well as executive duties?—I cannot deny a case of that kind.

8222. As you well know, you send confidential reports to me, and so does every senior officer, and from them altogether I see which officers have been well spoken of, and which have not; and in that way there is a certain amount of facility afforded, so that I am enabled to say,—This man is recommended highly by ten principal medical officers; and this man is spoken of in a contrary way; there can be no question as to which of these men is the best?—I think it is possible that a man may be a very good surgeon, and a very bad administrative officer.

8223. (*President.*) Generally speaking, do you not find that the man who shows the greatest ability in one thing, shows the greatest ability in another?—You find in civil life that great surgeons do not become great politicians.

8224. (*Sir T. Phillips.*) What are the proper administrative powers that are required in an inspector that are so difficult for an intelligent man to display?—I do not say that they are difficult. Any man may grow up to them.

8225. What are the administrative duties that you perform, for instance?—I have the general charge and management of the hospitals at Chatham. I have the whole of the invaliding duties; and there are a variety of things to attend to.

8226. Do you regard it as desirable for the public service that medical men should be enabled to retire on half-pay at the age of 45?—I should not compel them to retire till about 57.

8227. Do you think it desirable that an individual should have the option of retiring at 45 as against the public on half-pay?—Yes.

8228. (*President.*) That he should after 20 years' service claim an annuity for life, doing nothing in return so soon as after 25 years of service?—I do not see any advantage to the service in that; there is an advantage to the individuals.

8229. Is that the only ground upon which it seems to you that an individual ought to have a right, as against the public, to half-pay after 20 years, to put him on a par with the combatant officer?—Yes.

8230. (*Mr. T. Alexander.*) You only mean it to be half pay, not full-pay at that period?—No; I mean that they should retire at the pay laid down in that table.

8231. (*President.*) Your scale of retirement, you think, is necessary, under the supposition that the whole service should be promoted by seniority, and that it is necessary to get rid of the men at the top to make a stream of promotion?—I think it is founded a little on that idea; not altogether.

8232. You stated that you were not aware whether there is any roster for service?—I am not aware of any.

8233. Is there not at Chatham a table on which the names of officers next for service are inscribed?—No.

8234. (*Dr. A. Smith.*) Do you not place in the clerks' office a list of the men who have been longest at Chatham, and who are therefore the persons to be sent on detached duties?—No.

8235. Are you not aware that that system existed during my time?—No; you name men yourself for foreign service.

8236. But for detached duties?—I select them myself.

8237. How do you select them?—Generally speaking, some men come forward and ask to have the duty.

8238. (*Sir H. K. Storks.*) Those are the detached duties of the Chatham command?—Yes; Dr. Smith himself names the men to go abroad.

8239. (*Dr. A. Smith.*) Do you think that the assistant-surgeons at Chatham, first for foreign service, are not aware of it, are they not informed by me?—I think they have been generally informed by you to prepare for foreign service.

8240. (*President.*) Are those the first at Chatham, or the first in England?—I cannot answer that question. They are appointed to those duties from Dr. Smith. I cannot tell who is first for foreign service.

8241. Do you think it possible to make a roster for every officer to go upon foreign service by turn?—Yes.

8242. Would not that leave no option with regard to particular places for which some officers might be better calculated than others?—It would leave no option. It would be a strict roster, of course.

8243. Would it be the same in peace and in war?—War must admit of exceptions. For general service during peace time I mean.

8244. You do not mean that for chief commands, for example, if an expeditionary force was sent out, you would not take the men first by roster?—I think that that is a case for selection with local rank.

8245. (*Mr. J. R. Martin.*) Generally you would have a roster for the different commands?—For routine service.

8246. (*Dr. A. Smith.*) If such a roster existed, and were uniformly observed, would it not subject a number of officers to great hardships. If an assistant-

John Robert
Taylor, Esq.,
C.B.
10 July 1587.]

surgeon served five years in the West Indies with serious diseases occurring, and he comes home not in good health, but good enough to go to Chatham, and he remains at Chatham until all the assistants are sent off, and then comes to the top of the list on the roster for foreign service, and a vacancy arises again in the West Indies, do you consider that I should be justified in sending that man back to the West Indies?—I think with a fixed roster every man would take his chance.

8247. (*Mr. J. R. Martin.*) Would not the result of the roster be merely to regulate the course of tropical service, and service in temperate climates?—I mean a roster the same as they have in the Ordnance Department, which I believe has satisfied them all.

8248. (*President.*) In the artillery they go from station to station in turn?—Yes, I believe they do; they are not more than three years at the station.

8249. Have you formed any opinion on the subject of confidential reports?—I think that they are useful.

8250. Do you make them yourself?—Yes.

8251. Supposing it is your duty to report against an officer, do you inform him that you have done so?—If I make any special report against an officer I should inform him that I had done so.

8252. (*Mr. A. S. Stafford.*) But take the case of a general report?—A general report is never against him; it may be unfavourable. I might say that an officer at Chatham was neglectful or not of temperate habits, or I might consider that he was neglectful of his duties, or that he was particularly versed in some particular duty.

8253. (*Sir T. Phillips.*) Which is the special report, and which is the general report in that case?—If it were drunkenness I should specially report it, and in that case the man would know it.

8254. (*President.*) If you reported that so and so was a good and well conducted man, and was a very intelligent man, you would not communicate it to him?—No, that is a general report; it helps to give the director-general an idea of the particular sort of men that there are at Chatham; if I thought a man was ungentlemanly in his conduct, I should not communicate the report upon it to him.

8255. But if you reported an officer for intemperance you would communicate it to him?—Yes.

8256. (*Sir H. K. Storks.*) Would you not report it to your own commanding officer?—No, I would report it to Dr. Smith; if I made any distinct charge against him, I should report it to the commandant. If I put an officer under arrest for any breach of discipline, I must report it to the commandant immediately.

8257. (*Sir T. Phillips.*) Do you report upon professional deficiencies?—Yes; I may report that a man is specially versed in operative surgery, or that he appears rather deficient on that head, or that he shows himself an expert operator, or inept, but I do not acquaint him with that.

8258. You do not enable the man to ascertain that there are deficiencies which it is highly desirable he should try to correct?—I think he is generally made tolerably well aware of his deficiencies.

8259. Do you apprise him of them?—There is no regular official information given to the man.

8260. (*Dr. A. Smith.*) Do not you require him to operate in that case, so as to improve his knowledge of operative surgery?—Yes.

8261. (*Mr. A. S. Stafford.*) Do you report against him as entertaining different views of treatment from you?—Never.

8262. (*President.*) If you had an homœopathist, and you were an allopathist, would you mention that in your report?—I should mention that.

8263. So that a man would not have a report against him that would bar his promotion and be ignorant of it?—No.

8264. (*Mr. A. S. Stafford.*) How can you call it a confidential report if you communicate it?—It is no longer confidential if the man becomes acquainted with

it; it is only confidential in little matters which inform the director-general what a man is, and generally speaking, they are matters which the director-general could not discover unless the man was with him; they supply the place of personal acquaintance with a man.

8265. (*Dr. A. Smith.*) It is confidential in so far that the whole of the officers at the station are not made aware of it, but the individual is?—Yes.

8266. (*Sir T. Phillips.*) What is the practice with regard to the other departments of the army?—There is a confidential regimental report, and if I make a confidential report to Dr. Smith, accusing any man of anything, I think Dr. Smith generally writes to the man on the subject.

8267. (*Dr. A. Smith.*) If I do not I write to you to admonish him?—Yes.

8268. (*Mr. J. R. Martin.*) There is no standard rule of the service directing that such shall be done?—I am not aware of any.

8269. (*Dr. A. Smith.*) Would you say that it was not the practice of the service? Though there may not be any written rule, is it not the practice so far as you know?—Yes.

8270. (*President.*) Have you ever experienced any difficulty in establishing or in obtaining for yourself the advantages of the relative rank which your rank in the medical service gives you?—Very great.

8271. In what respect?—With respect to servants in the Crimea particularly, we suffered in that way; we could not obtain servants, and every military officer, no matter how junior he was, of any rank, got servants amongst the soldiers; no matter what our rank was, we could not get them.

8272. You had an allowance for one civil servant in lieu of the bātmān allowed from the ranks?—Yes; and though it was a liberal allowance, we could not get servants at all.

8273. Have you ever sat upon a court-martial?—No.

8274. Have you known instances of medical officers sitting on courts-martial?—No.

8275. On mixed boards?—Yes.

8276. Do you rank according to your relative rank?—No; as juniors.

8277. That is, the senior medical officer on the board ranks junior to the lowest combatant officer?—Yes; I crossed from Constantinople to Balaclava in one of the steamers that carried sick troops; there was a staff surgeon of the second-class ranking as captain on board, and there was an assistant-surgeon under him; the military officer in command was a young lieutenant in the Guards, and he, a man of not more than two years' service, had to report upon how this surgeon did his duty, which I considered was very offensive indeed; the man was old enough to be his father.

8278. (*Sir H. K. Storks.*) I suppose the instruction given to him to report upon the medical officer, was not as to how he treated the sick, but as to his general attention?—He was to report how he did his duty.

8279. (*President.*) You could not make the surgeon report upon himself?—No; but it was offensive to require this young lad to report how the surgeon did his duty. I think that the service would have been much more benefited if the surgeon had been called upon to report upon the other.

8280. The rule as to the seniority of combatant officers in charge of troops is, that the commanding officer reports upon every person; and it happened in this case that there was an officer very much junior to you?—Yes.

8281. Surely the rule is a sound one, that the officer in command should report?—He might report militarily.

8282. He would report militarily upon a medical officer; he could not report medically upon him?—He was to report how he did his duties.

John Robert
Taylor, Esq.,
C.B.

10 July 1857.

8283. The lieutenant-colonel reports upon a surgeon, though he has no more medical knowledge than an ensign?—Perhaps he has not; but it is not so offensive.

8284. Do you propose in your recommendations to make any difference in the relative rank?—Yes. I propose to give them a grade higher.

8285. You would make an assistant-surgeon upon entrance a lieutenant?—Yes.

8286. And after a certain number of years, a captain?—Yes.

8287. You would make a surgeon a major instead of a captain?—Yes.

8288. After any number of years would you alter his position?—Yes. I would put him on the same footing as a military officer.

8289. You might in that way have a surgeon ranking above the lieutenant-colonel commanding the regiment?—That would not signify, as it gives him no military command.

8290. But according to you, if he sat according to rank on mixed boards or courts-martial he would be president over the head of the lieutenant-colonel?—I would not put him on courts-martial, except where medical officers were to be tried.

8291. Is there not a flaw in your proposal, that a case might occur in which the relative rank of a surgeon in a regiment might be higher than that of the officer who was in command of the whole?—It is merely relative rank; it gives no military command.

The witness withdrew.

DR. FRANCIS SHORTT ARNOTT examined.

Dr Francis
S. Arnott.

8298. (*President.*) What is your rank in the Indian service?—Surgeon.

8299. Are you retired?—No.

8300. Are you on furlough?—Yes, on sick leave.

8301. Where have you served?—In the Bombay presidency.

8302. In the field?—Yes.

8303. In what campaign?—In the campaign of 1848 and 1849, at Mooltaun and Guzerat, and in the subsequent advance on Peshawur. I was in medical charge of the 1st Bombay fusiliers. I have a medal and two clasps for my services.

8304. Can you state the organization of the Bombay medical department?—It is composed of assistant surgeons, surgeons, superintending surgeons, and a medical board over the whole. These are all commissioned officers; but there is also a subordinate medical department, the seniors of which are warrant officers, of whom a few have got the rank of sub-assistant surgeon, with increased pay.

8305. Does the medical board answer to the department of the director-general in England?—Entirely.

8306. Does that apply to the Bombay army only?—There is one medical board for each presidency.

8307. How are the medical officers appointed, and what is the system of promotion?—They are appointed by competition in the first instance as assistant surgeons, they are then promoted by seniority to surgeoncies, and again to superintending surgeons generally by seniority, according to the orders they may be by selection; to the medical board by seniority and selection, but generally by seniority.

8308. Who are the authorities who promote them?—The government. It is by a government order.

8309. Not by the superintending board?—No.

8310. Where there is any selection made as to the rank of superintending surgeon, who makes that selection?—I believe the governor makes the selection, it may be on the recommendation of the medical board and Commander-in-Chief.

8311. It is done by the Governor-General?—Yes.

8312. (*Mr. J. R. Martin.*) Frequently it is done upon the recommendation of the Commander-in-Chief?

8292. (*Sir H. K. Storks.*) Would it not give the choice of quarters?—Always subordinate to the commanding officer. A captain in a regiment may be a lieutenant-colonel, but he only in his regiment is a captain. A captain in a regiment is often senior in the army to a lieutenant-colonel; and no inconvenience arises from it that I know of.

8293. (*President.*) Have you any other observation to make upon the relative rank and precedence of medical officers?—Nothing further; I should wish their relative rank to tell in all respects, except in command; the medical officer wishes for no command at all. He wishes to have substantive rank, whatever it may be.

8294. They stand in the "Army List" after the commissariat, for example, and that you object to, do you not?—I think they ought to stand before them.

8295. (*Mr. J. R. Martin.*) Has it not happened that medical officers have performed military duties efficiently and have fallen back subsequently to their proper duties, without a thought of what had passed?—Yes.

8296. (*Mr. T. Alexander.*) Have you any objections to the first-class staff-surgeon wearing a brass scabbard?—I think that there should be nothing in his uniform that would place his rank below that of a field officer; I think that his rank should tell either way.

8297. (*Mr. J. R. Martin.*) You think that consideration should be shown to his feelings?—Yes.

—Yes. Then I fancy he receives a recommendation from the medical board.

8313. (*Sir H. K. Storks.*) Is the medical board under the orders of the Commander-in-Chief of the Presidency?—He is over all.

8314. Are the advantages held out to the service sufficient to induce the best men to compete for your appointments?—I think so.

8315. Do medical men share in honorary distinctions with combatant officers in the field?—To a very small degree.

8316. Not so much, you think, as they are entitled to?—I think not.

8317. Were the duties of the medical officers during the campaign of 1848 and 1849 very arduous?—Yes, very.

8318. What was the number of medical officers with each regiment during that campaign?—For part of the campaign I had only two assistants, but for the greater part I had three. None of the native regiments had more than one medical officer.

8319. (*Mr. J. R. Martin.*) What was the strength of your battalion?—About 900.

8320. (*Sir H. K. Storks.*) Were you in a European regiment?—Yes.

8321. (*President.*) How comes it that the native regiments have so few medical officers?—I do not think the arrangement a good one. No regiment ought to go on field service with less than two medical officers; European regiments ought to have four.

8322. Have you known any inconveniences result from the present small number of medical officers?—Yes; even in the ordinary duties of a camp great inconvenience sometimes results from it.

8323. (*Sir T. Phillips.*) Is there less disease in the native regiments than in the European regiments?—Yes, less.

8324. (*President.*) You state, that you did not get your share in the distinctions of that campaign, you mean that you were not mentioned in the Gazette?—We were not mentioned in the Gazette. No medical

officer of the Bombay corps was mentioned in any despatch.

8325. Is that the practice?—I fancy it was an oversight, but the newspapers took it up.

8326. Was the omission rectified afterwards?—Never; some letters were circulated, but nothing was printed in orders or in a despatch.

8327. (*Sir H. K. Storks.*) No medical officer obtained the order of the Bath?—Yes, the senior medical officer did.

8328. How was that, if he was not mentioned in a despatch?—I fancy a recommendation was afterwards made by Lord Melville to the Commander-in-Chief.

8329. (*President.*) Are you certain that he was not originally mentioned in a despatch?—I am almost certain.

8330. (*Dr. A. Smith.*) What was the name of the senior medical officer?—Straker; he was made a C.B.

8331. (*President.*) Are the officers in the Bombay medical corps sufficiently numerous for their duties?—I do not think so, except for duties in the field; the duties almost always devolve upon the men who have just entered the service.

8332. In the camp you say that one medical officer alone is attached to a native regiment, but that is not the case with a European regiment?—I have very often been left with only one assistant-surgeon, and sometimes with none. It depends upon circumstances. I have generally had two, but they only remain a very short time, they are removed again.

8333. Are you, generally speaking, satisfied with the position held by medical officers in the army?—I am not. The position assigned to medical officers by the present regulations and usages of the service, is most unsatisfactory.

8334. In what respect?—I do not think that our relative rank is of any use to us.

8335. In what way?—When brought in contact with other officers on any duty, he has no rank whatever, he ranks junior to every other officer.

8336. You mean you do not rank according to the date of your commission?—Yes.

8337. What is the good, then, of giving you a commission?—No good at all; it makes me a commissioned officer, but I am the lowest grade of commissioned officer from the day I enter till I leave.

8338. (*Sir H. K. Storks.*) You take your choice of quarters according to your relative rank?—That I have had disputed. On one occasion, I was turned out of my quarters, against which I remonstrated, but all the authorities, from my immediate commanding officer to the Commander-in-Chief, decided against me. I then appealed to the Governor-General of India in Council, and got redress; but when the decision came I was about to leave the station.

8339. You share in the batta and in prize money?—In prize money we do not share according to our relative rank. Our superintending surgeon ranks as lieutenant-colonel, but in prize money he shares as major.

8340. (*Mr J. R. Martin.*) In practice, did it not happen to you that you were placed on committees without strict reference to your rank, through the kindness and consideration of your brother officers?—It has often occurred to me to be put on as president of committees by courtesy, which I ought not to have been.

8341. (*President.*) Is there any general rule laid down upon the subject?—Nothing is properly defined in regard to our rank.

8342. (*Sir H. K. Storks.*) Is there anything laid down to the contrary?—There is a written rule.

8343. Where is that?—In our regulations; the order was published by the President of the Council of India in Council, on the 25th November 1848.

8344. (*Mr. J. R. Martin.*) The revival of that rule was made to apply to you afterwards in your regiment, and then you fell to the bottom of the list?—Yes; in 1847 or 1848 it was re-issued, and

then on all committees I was junior, whoever were the members.

8345. (*President.*) When you sat as president, or according to the date of your commission, it was prior to the re-issue of this regulation; since then you have sat junior to the youngest combatant officer?—Yes.

8346. For what purpose do you consider that a commission is given to a medical officer?—I consider that it is given to a medical officer for the same reason that it is given to a military officer, namely, to give validity and force to his authority in the discharge of his duties.

8347. It does that, does it not, so far as his medical duties are concerned?—Scarcely that; I am not sure that I am justified in placing a man under arrest in my hospital.

8348. (*Sir H. K. Storks.*) You would feel no hesitation in placing a soldier in the guard-room?—I never put a soldier in the guard-room.

8349. There is no regulation forbidding that?—I can place him under arrest by directing my sergeant to make him a prisoner; but I am doubtful, whether, of my own authority, I could do it.

8350. (*Sir T. Phillips.*) How can you authorize a sergeant to do that which you believe you cannot do yourself?—I am not quite sure about it, but I believe I have that power.

8351. (*Sir H. K. Storks.*) To all intents and purposes the real order which places that man in confinement is the order of a superior officer?—Yes.

8352. Therefore, you, in your relative position, having given that order to the sergeant, are the person who gave the order?—I am not quite sure that I am justified in giving the order; my sergeant is responsible for the proper control of the hospital; I am not sure whether he does not do it of his own responsibility; I am not sure that I have any warrant for it, and that my authority might not be disputed.

8353. (*President.*) On the occasions when you sat as president, did the other members raise any objection?—I never heard of any; I was always looked upon as a most useful member on such committees, and I generally found that my opinions were adopted and acted upon, and the other members never grumbled.

8354. Since the issue of that order the authority which your commission gave you has been infringed by a subsequent order emanating from a less high authority than that which conferred the commission upon you?—That is entirely my opinion; my commission was given to me by the governor in council, but the commander-in-chief's orders infringed my commission. When a medical officer is placed on a committee by the orders of the government, he takes his proper place on that committee; it is only under orders issuing from the military authorities that he is deprived of his proper position on such duties.

8355. If the governor-general ordered a committee, and placed upon it a military officer of lower rank than yourself, would you take precedence of him?—Yes.

8356. (*Sir H. K. Storks.*) I suppose that is according to a local regulation?—I rather think it is a regulation in the royal army.

8357. Are the regulations for the Bombay presidency the same as those for the Bengal presidency?—Yes. I will put in the order.

[Order, dated Fort William, 25th November 1848.

12. Agreeably to the practice in Her Majesty's and the Company's service, when committees, composed of military and medical officers, are convened by the Commander-in-Chief, the president of such committees is invariably a military officer; and the members take precedence relatively to each other according to the succession in which they are named in the order convening the committee, viz: military officers first, and then medical officers.

13. In convening such committees, Commanders-in-Chief are especially careful that the members shall, as far as possible, be officers whose position relatively to

Dr. Francis S. Arnott.

10 July 1857.

*Dr. Francis
S. Arnott.*

10 July 1857.

each other, as members of the Committee, does not materially differ from that which is assigned to them for the purpose of regulating their claim to quarters, and prize money.

14. When committees are convened by government, composed of military and medical officers, or of these and civilians also, the relative precedence of the members should, as is the case with commissions appointed by Her Majesty's government, be that in which the members are specified in the orders convening the committee. In such cases, the president may belong to any branch of the service.]

8358. (*President.*) What you wish is that the relative rank should confer the same privileges that it did prior to the reissue of that order?—I think so; for the good of the service that ought to be the case.

8359. You do not mean that a medical officer should command on parade?—No.

8360. (*Dr. A. Smith.*) Supposing that you were present at mess with six or eight ensigns, you having the rank of captain; if any disturbance took place would you not consider that you were justified, as having the rank of captain, in putting the officer who was in the wrong under arrest?—I consider that I would not have the authority to do that.

8361. You admit that you are an officer?—Yes. I believe my duty there would be to point out to the senior officer present the irregularity that was going on. I think that my authority might be disputed on such an occasion.

8362. (*Mr. J. R. Martin.*) You have no certainty as to any power which may be attached to your commission in any way whatever?—None.

8363. (*President.*) Would you under the existing state of things make it a rule that no medical officer should sit on a mixed committee or a court-martial?—I prefer not sitting at all on mixed committees. I prefer being ordered to appear as a witness. I would relieve medical officers of all such duties rather than they should occupy the position which they now do.

8364. (*Mr. J. R. Martin.*) The position being hurtful to their feelings?—Yes.

8365. (*President.*) Are the emoluments of your service satisfactory?—I think they are.

8366. They are larger than in the Queen's service, are they not?—Yes, people out in India must be better paid. Officers of the royal army serving in India receive the same rates of pay as officers of the company's service.

8367. Is the mortality among medical men greater than among other officers in your service?—I believe it is.

8368. (*Mr. J. R. Martin.*) Is it generally throughout India the same?—Yes, I believe so.

8369. Are the superintending surgeons numerous enough to conduct the duties that are required of them?—I think not. I think we require more.

8370. They are the only officers having inspectors' duties to perform?—They are.

8371. Can you give the number in each rank in your presidency?—Three members of the medical board; five superintending surgeons; forty-five surgeons. The assistant-surgeons vary considerably; of these a number are generally absent in England, and the duties fall very heavy on the remainder, to which, indeed, they are barely equal.

8372. (*Sir T. Phillips.*) Have you an average term of years that an assistant-surgeon serves before he becomes a surgeon?—It varies; I was 16 years assistant.

8373. Within what limits would it fluctuate?—It fluctuates from 13 to 16 years.

8374. Is 13 years the shortest time that you have known?—I believe it is the shortest time that has occurred within my period of service. I know that men who were in the service when I entered were promoted in six years, but that was on account of the augmentation that took place in 1824.

8375. The shortest period that you have known men serve in that grade is 13 years?—Yes.

8376. The longest is how much?—16; promotion is getting slower every day.

8377. How many years have you been in the service?—I have been 25 years in India, and three years at home.

8378. You have a general experience of 28 years?—Yes.

8379. (*President.*) Do you find that the proportion of inspectors to the executive officers is not sufficient in your service?—I consider not.

8380. An augmentation has recently been made? I am not quite aware of that; I have heard that there has not been.

8381. The direction of the department rests entirely with the board, does it not?—Yes.

8382. How is that board constituted?—Generally the three senior members of the service.

8383. Lord Dalhousie recommended that instead of being the three senior members of the service they should be taken by selection?—I think that is a very good way. Incompetent men, I think, ought to be overlooked.

8384. Would you discontinue the board and appoint one man to be selected?—I should not approve of that at all.

8385. On what ground?—Because I consider the duties of our medical board sufficient for any three men.

8386. You think that the duties are too onerous to be discharged by one man?—Yes; we have military duties, civil duties, and naval duties to perform.

8387. How have you naval duties?—We have all the Indian navy.

8388. (*Sir H. K. Storks.*) That is only in the Bombay Presidency?—Yes, but it applies strongly to that Presidency.

8389. (*President.*) If you had staff enough given to one man to execute the duties performed by three, would not the concentration of the duties in one be an advantage as against a board?—Yes, but in that case I would have a director general over the board.

8390. (*Mr. J. R. Martin.*) The board being in the form of a scientific council?—Yes.

8391. (*President.*) Would you give them authority?—No, the director-general should be supreme.

8392. (*Sir T. Phillips.*) The council would simply be his advisers?—Yes.

8393. (*President.*) And to relieve him of detail and routine duties?—Yes, entirely; he could not get through them.

8394. You have mentioned that the duties are civil, military, and naval: what are the military duties of the board?—They have the supervision, control, and direction of the whole duties of the executive medical officers, and the selection, training, and education of a large subordinate establishment. They are, besides, very much engaged in details, for want of a due proportion of staff by which this part of the duty might be carried on.

8395. (*Sir T. Phillips.*) How do you mean that they have the control?—They examine their practice.

8396. In what shape?—They have the returns and they examine them; they have their cases and they examine them; they have all the documents.

8397. Do you mean, that practically, they can judge whether a particular soldier has been treated properly by a medical man?—It is supposed so; the cases are sent in periodically.

8398. Can there be any reality in it?—I think so. Every medical man can judge of the manner in which cases are kept.

8399. (*President.*) They exercise the same power in that respect as the director-general does in the Queen's service?—Yes, I fancy so.

8400. (*Sir H. K. Storks.*) Have they confidential reports to make to the Commander-in-Chief?—I believe they do, but I am not positive.

8401. (*President.*) They have the discipline and management of the whole medical department?—Yes; and the recommendations for vacancies for

appointment, which are very seldom made, except by seniority.

8402. Are not the stations given, some being much better than others, as rewards of superior merit?—Sometimes they are, but not by the medical board; generally by the government or the Commander-in-Chief.

8403. All the plums are in the hands of the Commander-in-Chief and the government?—Almost entirely, that is what I mean. Our medical board is inefficient, they have power, but they have no power directly to reward or punish.

8404. (*Mr. J. R. Martin.*) Has not this arisen from their being appointed on the seniority principle?—I cannot say the cause.

8405. (*President.*) Do you consider an alteration advisable in that respect?—Undoubtedly; if a director-general is appointed, he ought to have the whole power and authority.

8406. (*Mr. J. R. Martin.*) Power to recommend?—Yes.

8407. The real power being in the governor-general and the Commander-in-Chief?—Yes, power to confirm always rests with them.

8408. (*President.*) Do you think that the constitution of the medical board could be improved by introducing the civil element into it?—Certainly not.

8409. What are the duties of superintending surgeons?—They are very similar to those of deputy-inspector in the royal army. Their duties are chiefly paper work, checking, examining, and comparing returns, indents, and so on.

8410. (*Mr. J. R. Martin.*) And reporting?—Yes.

8411. (*President.*) Is there any statistical department under the medical board?—None distinct.

8412. Are there any army statistics published in the Indian army, with regard to the rates of mortality and the amount of sickness?—If at all, only through individuals, not by government.

8413. (*Mr. J. R. Martin.*) They are not made available for the purposes of European science?—No.

8414. Were there a sanitary department at the India House, would not that defect be remedied?—Yes.

8415. (*Sir T. Phillips.*) Does the superintending surgeon treat disease?—Never.

8416. (*President.*) Does he inspect hospitals?—Yes; but he very seldom interferes with the treatment.

8417. (*Sir T. Phillips.*) He never treats at all, does he?—No.

8418. (*Dr. A. Smith.*) He may be consulted by the surgeon, may he not?—Undoubtedly; I very often consulted my superintending surgeon.

8419. (*Sir T. Phillips.*) That would be a matter of option with you?—Yes; I fancy that every man does it; when a medical man comes into a hospital the regimental surgeon very likely points out difficult cases to him.

8420. Is the surgeon who has the treatment of disease, the person actually responsible for it?—Yes, of course.

8421. He is not required, unless he thinks fit, to consult the superintending surgeon?—No, I do not think he is; but I think every man would do it.

8422. (*Dr. A. Smith.*) Is it not generally understood that if a senior officer comes in, it is usual, when there is a bad case, to consult him?—It is the practice, and I think every man would do it.

8423. Is it not generally understood that he ought to do it?—I think so; I always made a point of doing it.

8424. What are the duties of a regimental medical officer for each day?—In India all duty must be done in the mornings and evenings. As soon as the patients had time to clean and dress themselves, and the ward could be swept out and arranged, I paid my visit. I saw the new admissions; then visited my former patients; I inspected the hospital, the diets, &c., signed

the reports, sent off letters, &c.; I next visited the cells, and perhaps the barracks, and then saw the sick officers, or any of their families who were sick; that was the general routine.

8425. (*Mr. J. R. Martin.*) And the same in the evening?—Yes.

8426. (*Sir T. Phillips.*) Is all disease treated in the hospital?—Yes, except officers.

8427. (*President.*) Have you any general hospitals as well as regimental hospitals?—There are general hospitals. There is a general hospital in Bombay for all sorts of Europeans.

8428. I mean an army general hospital, for the admission of all soldiers, irrespective of the regiments to which they belong?—No, every regiment has its own hospital; there is no other.

8429. Can you carry that out in the field?—Then we have general hospitals.

8430. (*Sir T. Phillips.*) Do you call it a field hospital?—Yes.

8431. (*Mr. J. R. Martin.*) Which is only kept up for the occasion?—Yes.

8432. (*President.*) What assistance has a regimental surgeon in the performance of his duty?—I generally had from one to three assistants.

8433. How are they employed when they are first appointed?—They are generally attached to European regiments, for the purpose of learning their duty and getting acquainted with the habits and so on of the soldiers.

8434. How long does he serve so before he practices?—It varies very much, according to the requirements of the service, I should say probably from four months to a year or a year and a half.

8435. During that time he is more in the position of a pupil?—Yes; after a time I always give them a share of the practice.

8436. Did you ever serve in the navy?—No.

8437. (*Sir James Clark.*) Is ever an assistant obliged to serve in the navy on your station?—According to the present rules he is obliged to serve in the navy.

8438. (*Mr. J. R. Martin.*) He commences his services in that way, does he not?—Yes.

8439. (*President.*) As I understand you all the sick are treated in the regimental hospital, except in the field?—Yes, and there they have a general hospital.

8440. Do the patients wear their own clothing in your hospital?—Never.

8441. Do you put them under stoppages?—Yes, always, except he is a wounded man.

8442. What amount of stoppages do you put them under as compared with their pay?—I think the amount is $3\frac{1}{2}$ annas a day, which is about sixpence.

8443. What proportion of their pay is that?—I think a quarter or a half.

8444. Is a man's pay 2s. a day?—Not so much; but I cannot at this moment speak exactly as to the amount.

8445. Are you speaking of a European regiment?—Yes.

8446. What does a sepoy receive?—A sepoy receives from eight rupees and upwards a month.

8447. Is the stoppage the same?—There is no stoppage in native regiments; they are not dieted in hospital, it is only the Europeans.

8448. (*Dr. A. Smith.*) If a man is wounded or injured so as to require to go into hospital do you make no stoppage?—No.

8449. If a man catches fever on sentry do you exact a stoppage?—Yes.

8450. Why is that, when you do not in the case of a wounded man?—It is an indulgence granted to a man who is wounded, or injured on duty.

8451. (*President.*) Your hospitals are supplied, I believe, by the commissariat?—Entirely, and very well.

8452. The hospital establishment is very good and efficient, is it not?—Yes.

8453. Will you state how it is divided; what is the first officer in it?—The apothecary.

Dr. Francis S. Arnott.

10 July 1857.

Dr. Francis
S. Arnott.

10 July 1857.

8454. What are his duties?—Generally to see the practice of the surgeon carried out; to see all his prescriptions made up and given; he also superintends the apprentices, and in the absence of the surgeon he can prescribe.

8455. Is that apothecary a part of the commissariat?—No.

8456. I thought the whole hospital establishment was a branch of the commissariat?—No.

8457. Is not the steward a part of the commissariat?—No; he conducts the commissariat duties; he is not part of the commissariat.

8458. The steward very much answers to the purveyor in this country, does he not?—Very much.

8459. (*Mr. J. R. Martin.*) Except that he is a trained officer for the duties from his boyhood?—He is a trained officer; he is entirely under the orders of the surgeon.

8460. (*President.*) Will you describe from what class he is taken?—He rises from the grade of apprentice; he begins as a probationer; he is afterwards promoted to an apprentice; he then becomes assistant-steward and assistant-apothecary; he is then made steward; his highest rank is apothecary.

8461. What medical education do they receive, if they are allowed to prescribe in the absence of the surgeon?—They are educated, generally speaking, in our large hospitals, and very well educated; they are afterwards promoted, after examinations, and by competition.

8462. (*Mr. J. R. Martin.*) They are educated in the medical colleges?—Yes.

8463. (*President.*) What age is a man generally when he becomes steward?—I should think probably 30.

8464. Are they generally half-caste?—Yes; but they may be Europeans or native Portuguese.

8465. And are they warrant officers?—Yes.

8466. (*Sir T. Phillips.*) What is the man apprenticed to?—To the hospital to learn all the duties. From apprentice he becomes assistant-apothecary and steward; next steward, and then apothecary.

8467. (*President.*) He probably serves for some years as steward?—Yes, probably from five to eight years.

8468. At the expiration of his service as steward, before he becomes apothecary, do you exact from him any fresh medical study?—There is no examination or anything of that kind; he is generally promoted by seniority unless there is some great objection to him.

8469. (*Sir T. Phillips.*) Is there any examination to ascertain that he has the requisite professional knowledge?—As apprentice, there is always; but the examination, I think, ceases after he is out of his apprenticeship.

8470. At what time is he examined, at the close of his apprenticeship?—He is examined first as a probationer, to see whether his English education fits him for the place he is put into.

8471. That is an examination in language only?—Yes; his knowledge of English writing and spelling; afterwards the examination is more extended, and he is then admitted as a second-class apprentice, if he gives satisfaction.

8472. Do you mean that he is examined on more subjects?—Yes, on medicine; a few questions are asked. He is then admitted as a second-class apprentice, and after a while, and further study on his part, and other examinations, he is promoted to be a first-class apprentice, he is then examined again.

8473. When the apprenticeship ceases?—Yes. He is not promoted to be assistant steward, or apothecary till he undergoes a satisfactory examination.

8474. (*President.*) Under whose orders does he act, the steward?—Entirely under the surgeon.

8475. (*Sir T. Phillips.*) Is the apprenticeship for a defined period?—No. It is more according to the talent of the boy. If he is a sharp boy he gets on quicker.

8476. (*President.*) Both apothecary and steward are entirely under the orders of the medical officer?—Entirely.

8477. Who manages the accounts, does he?—The steward manages all accounts with the commissariat.

8478. Are they audited by the medical officer?—Entirely.

8479. Does not that give a good deal of trouble to the medical officer?—Yes, at first, after a time it does not.

8480. It is a matter of routine?—The thing becomes simple when completely and thoroughly understood, but of course at all times requires time and attention.

8481. Does the steward purchase all supplies for the hospital?—None. He receives them from the commissariat, and issues them. He is not allowed to purchase any.

8482. Are all contracts made by the commissariat, whether for furniture for the hospital, or for food, clothing, and medicine?—Not medicine. That is distinct. We have a medical storekeeper.

8483. How are medical comforts supplied?—By the commissariat.

8484. And they are put into the hands of the steward as storekeeper to the hospital?—Yes.

8485. Then he issues them under the directions of the medical officer?—Yes.

8486. (*Mr. J. R. Martin.*) And he accounts to the commissariat officer?—He is not accountable to the commissariat for his expenditure.

8487. (*President.*) Do you not think that in all matters of account with the commissariat, the medical officer ought to be relieved of all responsibility?—Some people might like it. I think it might be an improvement.

8488. You cannot allow them to be performed without responsibility attaching to them?—No, but if that involved diminishing the surgeon's authority over the steward, I would certainly object to it.

8489. Do you think it important that the steward should understand he is the servant of the medical officer?—Yes, most certainly.

8490. (*Mr. J. R. Martin.*) When the surgeon may happen not to be a good man of business, would it not be wrong to embarrass him with those accounts?—It might be an advantage to relieve him then.

8491. (*Sir T. Phillips.*) To whom would you give the duty if you took it away from the surgeon?—I do not know that the steward ought to be held responsible; you could not put him under the quartermaster.

8492. Either the surgeon, or one of the assistant surgeons might always undertake the duty?—According to our system the surgeon always does.

8493. (*President.*) Suppose in your service the assistant-surgeon gave very extravagant orders, as to the quantity of diet to be issued, or the quality, would the steward make any remonstrance?—He would make no remonstrance, but would bring it to the notice of the surgeon. He has no right to remonstrate.

8494. To the notice of anybody else?—No; he would report to the surgeon only.

8495. He is not the servant of any other authority?—No. Generally speaking, he would do what was necessary.

8496. He would abate the quantity, but acquaint you with his opinion as to the unfitness of the supply ordered?—He would bring the matter to the notice of the surgeon; if he had not an opportunity of getting his orders he must obey the orders he has received.

8497. (*Sir T. Phillips.*) Would he ever report to the commissariat, that in his judgment there was an extravagant outlay?—Never.

8498. (*President.*) If repairs were required in a barrack, or the sewerage was defective, or any alteration were necessary in a building, by whose authority would it be done?—I generally apply to the engineer of the station.

Dr. Francis
S. Arnott.

10 July 1857.

8499. What does he do?—He either comes, or sends some of his people to examine it, and then it is done, or otherwise.

8500. Do you mean that he has a veto, and can say,—I do not think this is necessary?—Yes; he has a veto. I have often recommended repairs and alterations that have not been carried into effect.

8501. Does he object on the ground of the expense, or does he dispute your professional conviction?—No, I never had that disputed; it is generally on the score of expense, and the difficulty of getting the necessary sanction to the proposed alteration.

8502. You are naturally a good deal acquainted with the condition of the European soldier in India, has his diet been much improved of late years?—Yes; in every respect his diet and accommodation are much improved.

8503. In what respect is the diet improved?—A new scale was issued five or six years ago, which was considered a very great improvement; it allowed a better supply of vegetables.

8504. Had there been any scorbutic tendency before that among the men?—Yes.

8505. Have you ever compared the ration of the soldier in India with the ration of the Queen's troops in England?—No; but the ration in India is considered quite equal to the ration in this country, and probably superior.

8506. What quantity of meat is allowed?—A pound.

8507. With bone?—I think now the bone is to be taken out as much as possible. I have known a pound and a half given where it was bony.

8508. That was to compensate, probably, for the inferiority of the meat?—Yes. The accommodation for the men is very much improved.

8509. In barracks?—Yes. On the Bombay side they have been building new barracks, and they are of a very superior description. But at the old stations the barrack accommodation is still inferior.

8510. What space do you give to each man in a barrack?—I think about 1,400 feet; barracks and hospitals are very much alike.

8511. (*Sir T. Phillips.*) Is there as much space in a barrack as in a hospital?—I think so.

8512. (*Mr. A. S. Stafford.*) You stated that the amount of sickness was greater among the European troops than among the native troops?—I do not know that I stated that; it is the case.

8513. Do you attribute that to any other reason than the effect of climate upon foreigners?—I think that is one reason.

8514. Do you think that that one reason is sufficient to account for the larger amount of sickness among European troops?—There are other causes. Every body knows that a European soldier is a very imprudent man.

8515. (*Sir T. Phillips.*) In what respect?—In respect to drink and exposure.

8516. (*President.*) The mortality among the native troops, I believe, is very little in excess of the mortality among the native civil population?—I fancy not at all.

8517. Whereas the mortality among British soldiers in England is about double that of the civil population?—Yes.

8518. That shows a much greater degree of health in the sepoy?—Yes; I think the sepoy ought to be the healthiest man, and he always is selected as the healthiest man, but then he does duty only in his own country.

8519. So is the soldier here selected as the healthiest man?—Yes; but he does duty out of his own country.

8520. But the sepoy does not drink?—Very seldom; some of them very freely.

8521. But not like a European?—No.

8522. Is the sepoy accommodated in a barrack?—No, they are accommodated in huts.

8523. Do they build them themselves?—Yes, being allowed a certain sum for them.

8524. What sort of construction are they?—They are little places with walls about four feet high, and a thatched roof with corresponding height.

8525. Do they close them up completely?—I think so; no native can ever enter his house standing upright.

8526. How do they ventilate it at night?—I think by shutting up the door.

8527. It has been stated that one of the causes of the superior health of the sepoy, as compared with the European soldier, is that he does not sleep with numbers in an unventilated barrack-room, but that he is huted?—Two men cannot sleep in a hut unless they are of the same caste; the prejudices of caste would prevent a number of men sleeping together, but their huts are small and often crowded with their families.

8528. How many are there in a hut?—There may be several in a hut if they are of the same caste, and have not families.

8529. (*Sir T. Phillips.*) They sleep out of doors, do they not?—Yes.

8530. Is the sepoy soldier as much exposed, or is he more or less exposed in service than the European soldier?—Far more so.

8531. So that military service is not lighter, but heavier upon the sepoy than upon the European soldier?—Yes, in a camp where there are European troops and natives, the greater part of the guards are taken by the natives.

8532. They are exposed to night service?—Yes.

8533. (*President.*) Is there much night duty?—They take almost all the sentry duty.

8534. How many nights are they in bed, and how many nights on guard?—It varies. I believe about three nights in bed, but it varies much according to the exigencies of the service.

8535. (*Mr. J. R. Martin.*) Were the men much employed on night duty?—No; Europeans are very seldom employed on guards, and are not much exposed at night.

8536. At Aden were they employed on guards?—A treasury guard was on.

8537. On field service, of course?—Yes.

8538. Do they suffer from night duties in field service?—I do not know that they do.

8539. (*President.*) In your barracks in India where this large space is given, are there urinals separate from the rooms, or is there a large tub?—There is generally a separate room.

8540. With water turned on?—Yes, the men make their urine into a kind of channel, and it is carried off through pipes, by tiles into a cesspool.

8541. There is no stream of water running?—I never saw it; it is supposed to be washed every day, probably twice every day.

8542. The place is separate from the room?—Yes.

8543. Are the channels made of glazed tile to carry off the urine?—I have never seen that. It would be a great improvement.

8544. What do they use?—Generally granite.

8545. How are the men accommodated in the field?—In tents; we have excellent tents for European soldiers, with high walls and double flies, so that the men receive good protection in all weathers.

8546. In what other respects could the condition of the European troops, in your opinion, be still further improved?—Our barracks are very inferior; though some are very good. As to dress, I think there is great room for improvement; for soldiers in a hot climate the present dress is far too heavy.

8547. Are you speaking of the head dress?—The whole.

8548. What would you substitute for the present dress?—I would discontinue the full dress altogether. A man is never comfortable in it. I would discontinue the shako. My own regiment, under Lord Melville, marched to and from Mooltaun and Peshawur in undress and forage caps. I believe that is the best dress for any duty in India. A padded cover is made to come over the cap; it is quilted with cotton.

*Dr. Francis
S. Arnott.*

10 July 1857.

8549. Is there anything to hang down?—Yes; to protect the back of the neck.

8550. Is that as good as a turban, which protects the temples?—It is a substitute for the turban, and it is more easily put on, the turban takes time to put on and comes loose.

8551. You would do away with the coatee or tunic, and only retain the shell jacket?—Yes. The shell jacket is the best dress for any man to do duty in in India.

8552. What would you put next to a man's skin?—I am rather singular in that; I do not approve of flannel.

8553. Why?—I think that a man is too warm without it, and that it irritates the skin.

8554. What would you substitute?—A cotton shirt.

8555. (*Sir T. Phillips.*) Does flannel, in your opinion, increase the discharge from the skin?—I conceive that it does.

8556. (*Sir James Clark.*) Does it not protect a man from chills?—I do not know that it has that effect.

8557. (*Mr. J. R. Martin.*) In campaigning in the north of India, in cold weather, would not flannel be useful?—There might be a difference there.

8558. (*Sir James Clark.*) Are you speaking from your own experience upon a pretty large scale?—Yes, and from my own personal feelings.

8559. Is it the general opinion of medical officers in India that that is the case?—I am giving my own opinion.

8560. (*Mr. J. R. Martin.*) It has been stated before this commission, that when European troops take the field in India, the commissariat officer is very much disposed to favour the troops in front, and neglect the hospital supply, have you ever experienced such neglect?—Never; my supplies always gave me perfect satisfaction.

8561. Your hospital was as well supplied as the soldiers in front?—Quite so. Better most likely.

8562. Did you ever hear of this complaint before?—Never till this moment. It is an imputation on the commissariat that I never heard of before.

8563. (*President.*) What liquors are supplied to the European soldier in India?—Arrack is almost the only spirit.

8564. Is that given as a ration?—Yes; a man can have 2 drams daily, after 12 o'clock; none in the morning. Soldiers are very well off now, they get very liberal supplies of malt liquor, which, with tea and coffee, they are encouraged to take in lieu of the ardent spirits.

8565. In lieu of arrack?—Yes. They are encouraged to drink malt liquor instead.

8566. (*President.*) What is your experience of the sanitarium in India?—My experience is not very large, but I am not sure that anybody's experience is quite sufficient to enable him to form an opinion, what they are, or what they are not.

8567. (*Mr. J. R. Martin.*) They are found generally to be the best for the prevention of disease, rather than for the cure?—Yes. I do not think our sanitarium have had a fair trial, because they have generally put up temporary barracks, with anything but proper accommodation.

8568. (*President.*) Where are they situated?—Generally on the hills.

8569. (*Mr. J. R. Martin.*) The whole matter requires to be scientifically and properly examined?—Yes.

8570. (*President.*) What amusements has the European soldier in India?—They are encouraged to amuse themselves. Their favourite game is long bullets.

8571. A sort of bowls?—It is throwing an iron ball, a six pounder; each man showing his strength by throwing it.

8572. Is it possible to have very athletic games in so hot a climate?—They play cricket, quoits, fives, skittles, &c., but I would give them more opportuni-

ties for exercise and amusement in the shape of gardening, pioneers work, &c.

8573. I suppose very early in the morning?—Yes, in the mornings and evenings. They have for indoor recreation draught boards, billiard tables, and an excellent library.

8574. And baths?—Yes.

8575. Do they pursue their trades?—Yes.

8576. How do they pursue their trades?—In my regiment we had shoemakers, tailors, farriers, carpenters, bookbinders, and watchmakers. They are all encouraged, but sometimes they have not very much to do.

8577. (*Sir T. Phillips.*) For whose profit is this done?—Entirely their own.

8578. (*Mr. J. R. Martin.*) Is that privilege attended with any improvement in the conduct and health of the men?—I think so.

8579. In both?—I think that every man who enjoyed that privilege considered he was bound to be a good man. The privilege could be taken from him.

8580. It is no detriment to him as a soldier?—I do not think so.

8581. (*President.*) Is there any restriction as to number?—Yes. There would be necessarily.

8582. (*Sir T. Phillips.*) Is this a privilege not exercised without permission?—No. It may be done without permission being asked, though some men get permission. The tailors are regimental tailors, who are employed in making up the clothes of the soldier.

8583. (*Mr. J. R. Martin.*) The privilege, I suppose, is only given to steady men?—Certainly.

8584. (*President.*) What is the mortality in a European regiment in India?—I think in my regiment it was five per cent., including cholera.

8585. But exclusively of cholera?—One year when they had cholera my loss was 15 per cent.; and in another year when they had none my loss was down to 1½ per cent. I fancy my regiment was sometimes as healthy there as any regiment in this country.

8586. Do you know what the mortality is in the native regiments?—I do not know, but the mortality is less in them.

8587. (*Sir T. Phillips.*) With regard to the diet of native regiments, in what respect does it differ from the diet of the European?—It consists almost entirely of vegetables.

8588. What proportion is animal food?—Some of them never touch it.

8589. (*President.*) How is it supplied in the field? Where does the native get his diet?—He generally depends upon the supplies to each encampment. There are men who march along with the force.

8590. It is not bought by them of the commissariat?—They are entitled to it from the commissariat, if provisions are scarce or dear.

8591. Otherwise they trust to volunteer sutlers?—Yes.

8592. (*Sir T. Phillips.*) The ration consists of what he chooses to purchase?—Yes. The Mussulmans eat a good quantity of animal food, but not the Brahmins.

8593. Do the natives drink spirits?—Yes, but it is forbidden.

8594. Are they largely taken, or only as the exception?—The lower classes take spirits largely.

8595. Does the Hindoo soldier drink?—The high caste men very seldom, the low caste men more.

8596. Notwithstanding these low caste men drink, is their health good?—I have known low caste natives injure their health.

8597. (*President.*) Is the army to which you are attached high caste or low caste?—It is a mixed caste.

8598. There is drinking in it?—Yes.

8599. But not so much as in the Madras army?—I do not know that there is.

8600. (*Sir T. Phillips.*) The health of your army, though of mixed castes, is superior to that of Europeans?—Yes. The men are serving in their own country.

8601. Is a native soldier as long lived as a man who is not a soldier?—I fancy he is.

8602. (*Sir James Clark.*) You do not know anything to the contrary?—I know nothing to the contrary.

8603. (*President.*) Have you considered whether it would be advisable to appoint sanitary officers to an army in the field, or even in districts in times of peace?—I think it would be very desirable.

8604. What do you mean by a sanitary officer?—I mean a medical officer to select sites for hospitals, to look after drainage, to look after supplies of water, and all matters of that kind; and perhaps to advise on the nature of the duties, and so on.

8605. (*Mr. J. R. Martin.*) On everything relating to the health and comfort of the soldier?—Yes.

8606. (*President.*) Where would you take such an officer from,—from the medical officers of the Indian army?—Yes.

8607. Would you make him part of the medical department in the field?—Yes, but entirely independent of the chief medical officer of the army.

8608. Would they not clash?—I think their duties might be so defined that they would not clash.

8609. In the case of an army in the field, would you attach him to the quartermaster-general?—Yes, that would be a very good way, as that department would have to carry out his views.

8610. Do you think that this would not occur, that he might give some advice as to an encampment to the Commander-in Chief of the army, and that the chief medical officers might question his opinion, and give a contrary one?—I do not think he would do that, it may occur.

8611. (*Sir T. Phillips.*) If that happened, would you over-rule the authority of the man who was answerable for the proper treatment of disease by the opinion of the man who was not answerable for it?—Any man is liable to a mistake, and the health officer might select bad ground.

8612. Suppose the medical officer, who would have the treatment of the army when sick to attend to, to question the soundness of his judgment, would you still act upon the judgment of the sanitary officer?—I think so. If the sanitary officer found he had selected bad ground he would immediately correct it.

8613. (*Mr. J. R. Martin.*) You would give the two classes of officers credit for good feeling, and the same desire to forward the military service, that actuates all other officers?—I think so. We find that our opinions do not receive very much attention as it is, but I think the opinion of a man placed in that position would be much more regarded than our opinions.

8614. He ought to be an officer of rank, character, and trust?—He ought to be an officer of rank.

8615. (*Sir T. Phillips.*) As to the staff of the regimental hospital, as I understand, each regiment has a hospital?—Yes.

8616. And to that hospital is usually attached a surgeon, two assistants, an apothecary, a steward, an assistant-apothecary, and steward, and an apprentice?—It often happens that there is no assistant apothecary and steward; generally there are two apprentices and one or two probationers.

8617. Is there amongst those officers any one entrusted with the payment of money?—The steward has payments to make; in the field they are sometimes considerable.

8618. For all provisions supplied to the hospital when in the field?—I am talking of wages to the establishment. When I was in the field I drew 1,500 or 2,000 rupees a month which he had to disburse. He had nothing to do with paying for provisions.

8619. In the field does the steward pay for provisions?—Never. He pays wages.

8620. The commissariat supplies, and pays for everything required?—Yes.

8621. How is the hospital clothing provided?—By the commissariat.

8622. When not in the field does the steward pay anything?—Never.

8623. Who then pays the wages?—He pays them.

8624. You do not limit the payments he makes to the field, but the wages of the establishment he pays at all times?—Yes; certain of them.

8625. He receives from the commissariat moneys to make those payments, he disburses them, and accounts?—Yes. I am accountable for them.

8626. You would account to the commissariat, and get a discharge by showing that you had made those payments?—Yes.

8627. Who audits your accounts?—The commissariat.

8628. (*President.*) Who does the nursing?—We have a very good establishment for that; they are called ward boys.

8629. Where do they come from?—We pick them up anywhere; they are camp followers; they are generally low caste men.

8630. Are they chosen from the army?—Never; they are natives.

8631. What training do you give them?—They do not require much training, they are generally trained under the apothecary.

8632. Do they all speak English?—I believe so; they mostly speak broken English, and as the soldiers generally speak a little of their language, they understand each other.

8633. The ward boy understands enough to take the directions of the medical officer?—Yes. They receive their directions from the subordinate department, and they generally speak the native language very well.

8634. (*Sir T. Phillips.*) How many of these would be assigned to twenty sick people?—I think we give one ward man for ten.

8635. (*President.*) Have you formed any opinion upon the pay of medical men in the Queen's army, elsewhere, not in India?—I have. I think the medical department of the Royal army is very indifferently paid. I think that an assistant surgeon in the Royal service cannot keep up his studies nor the appearance of a gentleman under 10s. a day, at the very beginning.

8636. Do you think that you get the best men into the Queen's army?—I think so. The Queen's army contains the very best medical men.

8637. (*Sir T. Phillips.*) Is there any variation of the pay in the same grade in your service?—None. When a medical officer succeeds to the charge of a regiment, he is better paid than a young officer who is not entitled to that charge; he draws about 16l. a month. But unless he gets a charge there is no increase to his pay at any period of his service in the same rank.

8638. (*President.*) Are there different allowances in proportion to age, though no differences of pay?—Yes. Seniors generally get better appointments, and therefore are better paid; not otherwise, except by promotion to a superior rank.

8639. (*Sir T. Phillips.*) Does the difference in the allowance depend upon the length of the service, or upon appointment to a particular service?—A medical officer is promoted by length of service; he also succeeds to the charge of a regiment by seniority, that improves his pay.

8640. If he does not succeed to a regiment he does not get additional pay whatever his length of service may have been?—No.

8641. (*President.*) If a man has been with a regiment for a certain number of years, does he not get additional allowances?—Not unless he gets the charge of it.

8642. Does he get the medical charge of it on account of his seniority?—Generally he does.

8643. (*Mr. J. R. Martin.*) Are you aware that in recent orders sent to India to remodel the medical department, Lord Dalhousie recommends that the assistant-surgeon after 7 years service shall have the same rate of allowance when in charge of a regiment that a full surgeon has?—I have heard so, and I approve of that.

*Dr. Francis
S. Arnott.*

10 July 1857.

*Dr. Francis
S. Arnott.*

10 July 1857.

8644. (*Sir T. Phillips.*) You would make the actual appointment to the particular office, and not length of service the measure of the pay?—Yes; that is the rule.

8645. (*Dr. A. Smith.*) If it become necessary to erect a new barrack in the Bombay presidency, what steps are taken to select the site, and to devise a plan; who are consulted?—There is very often a committee appointed, an engineer officer, a military officer, a medical officer, and perhaps an officer from the quarter-master general's department to select the site.

8646. There is generally a medical officer appointed?—Very often; generally, I think.

8647. (*Mr. J. R. Martin.*) It is a sort of scientific council?—Yes.

8648. (*Dr. A. Smith.*) Who draws out the plan?—I think that is generally submitted by the engineer officer.

8649. (*President.*) The plan is submitted to a committee?—Yes.

8650. (*Dr. A. Smith.*) When you discover anything that is objectionable do you volunteer your opinion or are you required to state whether you approve of it or not?—I never found it otherwise than if I pointed out anything that I considered an improvement, it was immediately listened to. On a committee a man always states his opinion.

8651. Is a committee always appointed to draw up the plan?—I think they generally take into consideration the plan, at the same time they do the site.

The witness withdrew.

Adjourned.

Monday, 13th July 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

GEORGE RUSSELL DARTNELL, Esq., examined.

*George Russell
Dartnell, Esq.*

13 July 1857.

8652. (*President.*) Are you at present on half-pay or full-pay?—On retired half pay.

8653. What rank do you hold?—Deputy inspector-general of hospitals.

8654. Where have you served?—I have served in India, Ceylon, the Mediterranean, and North America.

8655. Have you formed any opinion with respect to the education of medical officers before being admitted into the service?—I have not given a great deal of attention to the subject.

8656. As to medical treatment, I think you have advocated some modes of dealing with soldiers with a view to the preservation of their health—as to the venereal disease?—Yes, I adopted a plan some years ago in the royal regiment, which I believe has since been adopted in some other corps, and which I found exceedingly effectual, at least in confining the disease within remediable limits, and preventing its after consequences. When I joined the regiment in America in 1839, I found the hospital crowded with cases of venereal disease, both primary and secondary. I found, also, that the practice in the regiment was that every man who went into hospital with a venereal complaint was obliged, when discharged to barracks, to bring up his duty; in fact, he was subjected to punishment. I represented to the commanding officer that this regulation had an injurious tendency, as it made the men conceal their disease. He said he would be happy to alter it, if I suggested another. I recommended that he should give very strict orders that every man, the moment he found himself affected with the most trifling venereal complaint, should report himself at the hospital; that I should report to him, on discharge from hospital, any soldier who I was satisfied had had the disease above three days; and that the man so reported should be sharply punished for disobedience of orders and concealment of his disease. Taking the disease thus in its earliest stage, it was very readily got rid of; and I scarcely ever after had a case of secondary syphilis.

8657. (*Mr. J. R. Martin.*) The early treatment of it, was the sanitary principle which you had in view?—Yes.

8658. (*President.*) When the men found that they were not visited after coming out of the hospital by any extra duty, they no longer concealed the fact of their disease?—No, they soon saw its good effects.

8659.—Was there no compulsory inspection?—No; there was the ordinary health inspection regularly every week.

8660. That is usual?—Yes. Every regimental medical officer is obliged to certify that he has performed this inspection, and has inspected the men for venereal disease. But my idea is, that any man almost who chooses may conceal his complaint in the early stage, even with the most careful inspection. By adopting this plan, I did not inspect the men for the venereal disease at all. I found that I had no necessity for it. Upon making the inspection for the general health, I always said to the men, I look to your honour to come forward if any man has got the venereal complaint, and they invariably did so. I found it to work extremely well.

8661. (*Mr. J. R. Martin.*) Where were you serving at the time?—In America, at Montreal, where there was a great deal of venereal disease.

8662. (*Dr. A. Smith.*) Had you the sanction of the head of the department to get rid of that weekly inspection?—I reported it to the heads of my department at home and abroad. I had the usual inspections for health. But I did not examine a man for venereal. It is a most odious and disgusting operation, and leads to very unpleasant consequences sometimes, and I do not believe that it is effective.

8663. (*Mr. J. R. Martin.*) Is it repugnant to their feelings?—Yes, very much so.

8664. (*President.*) Is there much small-pox in the army?—I believe there is; at Chatham I know there is, from time to time, a good deal of small-pox amongst the recruits and young soldiers.

8665. Is there any re-vaccination?—Not that I am aware of.

8666. Ought there to be?—Yes, I think every recruit, when he joins the service, when he is finally approved and attested, before he is handed over to the commanding officer for drill, should be vaccinated or

*George Russell
Dartnell, Esq.*

13 July 1857.

re-vaccinated by the surgeon. It would be a very excellent measure.

8667. (*Mr. T. Alexander.*) Is he not always vaccinated if they find no marks?—That is the rule and the practice too, I believe; nearly all the recruits bear marks of vaccination, but that is no proof that a man is protected against small-pox, as nine out of ten amongst those who contract the small-pox bear undeniable marks of vaccination. I would have the operation performed on every recruit, whether he had been previously vaccinated or not.

8668. (*President.*) Are you aware that in the Guards they re-vaccinate all the recruits?—No, I was not aware of it.

8669. What do you propose to do to enforce that regulation?—That every recruit should be re-vaccinated, by a compulsory order from the Commander-in-Chief.

8670. Did you practise that in the regiment that you were in?—No; the force of its necessity struck me while I was at Chatham some months ago.

8671. Could you do it without special medical sanction?—I presume not.

8672. (*Dr. A. Smith.*) Are you aware that an attempt has been made in several corps to do that, but the soldiers have stood up determinedly against it, exhibiting the mark on their arm, and saying that it was subjecting them to an unfair practice to re-vaccinate them?—No, I am not aware of it. I do not think that it would be a valid objection to the practice.

8673. (*President.*) There is no doubt that it is of value to prevent small pox?—Of very great value, because the mark of vaccination is no certain proof that the constitution is protected from it. Compulsory vaccination takes place with the public, why should there not be compulsory re-vaccination in the army?

8674. You are aware that the mortality in the army at home exceeds that of civil life, being nearly double?—I believe such is the fact.

8675. To what do you attribute the excessive mortality?—I should think, in a great measure, to the want of proper ventilation in barrack rooms, and inattention to other sanitary arrangements.

8676. Do you think that the ventilation is so bad as to produce a sensible effect upon the health of the soldiers?—Yes, I am sure it does at times.

8677. Have you been at night in the barrack rooms?—I have very frequently visited barrack rooms, as well as the between decks of troop ships at night, when the smell and oppression of the air were most offensive and distressing. The wards of hospitals, too, are often close and stifling at night, for soldiers have a propensity to shut up every aperture by which air can be admitted.

8678. (*Mr. J. R. Martin.*) You mentioned the between decks condition, was it by way of comparison with the barracks on shore?—Yes, in some measure.

8679. (*President.*) Do the men complain of the ventilation?—They complain of anything like draughts of air and do not appear sensible of the absence of ventilation.

8680. Non-commissioned officers and the men who go in in the morning complain of it, do they not?—They do. The sergeant-major of the invalid dépôt at Chatham has told me that when he goes to open the door of a full barrack room the first thing in the morning, he always stands on one side to let the "whiff of foul air" pass him; and that he has frequently seen men stagger and hold on by the rail of the verandah as they came out.

8681. Do you attribute at all the ophthalmia in the army to the want of ventilation?—It must have a considerable influence in propagating it.

8682. Have you ever had ophthalmia in your regiment?—Yes, in the royal regiment for nearly two years, in America.

8683. What did you do to get rid of it?—One measure adopted was the encamping of the regiment; the commanding officer, on my suggestion, encamped the regiment for a time, and from the first week of the

encampment until the week after the return of the regiment to barracks we had not a single fresh case of ophthalmia.

8684. (*Mr. J. R. Martin.*) It was the means of ventilation that produced so much good?—No doubt chiefly.

8685. (*President.*) When you returned to barracks did it break out again?—Yes, but not in so aggravated a form; the barracks in the interim had been purified and cleansed.

8686. Do you attribute any of the increased mortality to the want of sufficient exercise among the troops?—Yes, and I think if gymnastic exercises, and manly sports and games, were more encouraged, that they would be found a valuable means of improving the health and vigour of the soldier. His only exercise now almost is drill.

8687. Is not that good exercise?—I think too much of it is not.

8688. Why?—It is often harassing to the men from its monotony.

8689. There is very little variety afforded?—Very little variety is afforded; and there is little to develop the muscles, and rouse the nervous energy.

8690. (*Mr. J. R. Martin.*) Besides the absence of mental recreation and cheerfulness?—Yes; it is quite a mechanical sort of exercise, without exhilaration.

8691. (*President.*) Do you attribute the superior healthiness of the cavalry to the greater amount of exercise that they take?—No doubt much of their superior healthiness may be attributed to that. Their drill is much more exciting and less fatiguing, and their stable duties I believe to be very conducive to health.

8692. You are aware that in the French army they consider that dressing their horses twice in a day is a thing advantageous to the health of the men?—I think it is very likely to be so.

8693. You would recommend gymnastic exercises?—Yes; I would recommend games of all kinds to amuse and entertain the men, and to develop their muscles and physical powers.

8694. Have you had a great deal of experience in army hospitals?—Yes, I have been 36 years in the service.

8695. How long were you at Chatham?—The last time, I think, I was at Chatham 17 months as deputy-inspector, and principal medical officer.

8696. Before that time how long were you at Chatham?—I was nearly seven years there before, as a staff surgeon of the first class.

8697. Do you consider that there is more writing imposed upon a medical man than is necessary for the regularity of the service?—The great amount of writing has always been complained of by medical officers.

8698. (*Mr. J. R. Martin.*) Return making and reports?—Yes, and case taking; every case is required to be fully registered, except a case of itch.

8699. Are cases, whether important or unimportant, equally detailed?—They are all detailed, but not equally so.

8700. (*President.*) If you had not that medical register so kept, what record would you have of disease?—I should think it would be sufficient, as in the navy, for the chief medical officer of the hospital to point out the cases that should be detailed, and let them be taken at full length, and with considerable care, and kept as a record.

8701. You must have some record, besides the admission and discharge, of the cause of admission?—Yes, of course, the "admission and discharge book" gives the man's name, age, service, and disease, and you might add the cause of the disease, and where contracted, whether it was the recurrence of a disease or the first attack, and so on.

8702. Is it not necessary for the officer who invalids the troops, who adjudges the rate of pension according to the cause of disability, to refer to this book to show what the original cause of the man's disability was?—It is sometimes useful for this purpose.

George Russell
Dartnell, Esq.

13 July 1857.

pose. but it as often happens as not that the particular information required is not to be found in it.

8703. The admission book would answer that purpose?—It would give nearly all that is required in general.

8704. Could prizes be given for case books; the navy do, do they not?—It might be a very useful way of rewarding a zealous medical officer. In the navy they give a gold medal for the best kept medical register. It is called the "Blane medal."

8705. Were you, when principal medical officer at Chatham, required to refer to the medical registers of regiments, and to decide upon cases?—Frequently.

8706. There you found them useful?—Yes, but in common cases; they could have been done without.

8707. (*Mr. J. R. Martin.*) An admission and discharge register in place of the large case book, in fact?—The register is the case book, it is called the "medical register;" the other is the "admission and discharge register."

8708. (*Sir J. Clark.*) Have you ever been on ship board with a regiment when they have been transported from one place to another?—Yes, frequently.

8709. In what state was the regiment between decks?—In some ships very comfortable, in others quite the reverse. Latterly the ventilation and accommodation in troop ships have been much more attended to than formerly, and they are both much more perfect now than they used to be. I inspected a great many troop ships at Gravesend, when I was quartered at Chatham as a staff surgeon. There is a great difference between the East India Company's ships and the government transport ships.

8710. In what way?—The accommodation in the East India Company's ships is much better, and the provisions superior in every way.

8711. Trading ships, do you mean?—Yes, ships chartered for the conveyance of the troops.

8712. (*President.*) The soldiers on board ship are not berthed in the same way as the seamen are?—Not always, I believe.

8713. Do they give them hammocks?—In all the East India Company's ships they have hammocks. In some of our transports there are standing berths.

8714. Which are the best?—It is difficult to say; some prefer a standing berth and some a hammock.

8715. A hammock is much the best in rough weather to a landsman, is it not?—Yes; the chief objection to a hammock is, that you lie so close to the deck above you.

8716. (*Mr. J. R. Martin.*) The men breathe the consumed air more by being elevated than they would on deck?—Yes, possibly they do.

8717. (*President.*) You have some plan, have you not, for the organization of the medical staff corps?—Yes, I have a plan for the amalgamation of the medical department with the medical corps.

8718. Will you give an outline of it in a few words?—I have here the outline of a plan for improving the social position and status of medical officers of the army, which I beg permission to hand in.

It is as follows:—"The want of some substantive rank and improved social status has long been felt by officers of the medical department of the army, and an available opportunity for obtaining this object in a sufficient degree appears to present itself by effecting an absolute amalgamation of the officers of the department with the newly-formed medical staff corps. This corps, which has been raised for hospital purposes solely, is now an important body of 1,200 men, but very anomalously placed in relation to other sections of the army, from being without officers, except two staff captains at head quarters. This anomaly is much spoken of by the men, who complain that they have no officers whom they can really call their own, or look up to for protection and support. It is true, the warrant directs that they shall be under the control of the principal medical officer

when on hospital duty, and under that of the military authority wherever they may be stationed for discipline, &c. Now, as the hospital corps is not an armed one, the men require no drilling except to set them up, to teach them to salute as soldiers, and to march to time in bodies, &c., and this could always be done under the staff captains at the head quarter dépôt. Further, discipline under military authority means nothing more than punishment for crime, which could equally well be awarded by medical officers, were they permitted to exercise the privilege themselves, and to hold or assist in courts-martial on their own men. Did the officers of the department belong to the corps, they would naturally feel a much greater interest in it than they now do; the feeling would be reciprocal, and the men would act with more cheerfulness, and submit to their authority with more readiness and respect than they can otherwise be expected to do. To carry out these views, it is suggested that the officers of the medical department be placed in the same relation to the medical staff corps that the officers of the royal engineers are to the corps of sappers and miners (officers and men of this arm of the service have recently been embodied in one corps, "The Royal Engineer,") and that they should take rank from, and be gazetted to, the medical staff corps, under a new set of titles, which would be more plainly indicative of their profession, as well as their relative rank, than the present somewhat unmeaning ones are. For instance, the present titles of inspector, and deputy-inspector-general of hospitals, beside being cumbrously long, designate neither the rank nor the profession; for an inspector or deputy-inspector of hospitals may as well be supposed to be a civilian or a purely military officer as a medical officer. The division of staff surgeons also into first and second class is absurd, leads sometimes to very awkward and unpleasant mistakes, and does not indicate their rank, either relatively to the military officer, or to one another, the one rank of staff surgeon being neutralized by the other. And as to the title of assistant-surgeon, he, having once attained his diploma or degree from a constituted college, is as much a qualified surgeon as the senior inspector-general. It is further suggested, that the amalgamated corps should be styled, under authority, the "Royal Medical Staff Corps;" that the whole of the medical officers of the regular army should be gazetted to it, and that all should wear the same fixed uniform; that there should be no purely regimental officers, as at present, but that those intended for duty with regiments of cavalry, artillery, the line, &c. should be simply attached or posted. Medical officers would thus be more readily available for all the exigencies of the public service than they now are, and in any numbers that particular circumstances might call for, while the difficulty of obtaining leave of absence (so long complained of) might be considerably lessened. The saving to the country, too, would probably be considerable, as it certainly would be to the officers themselves, by relieving them from the heavy expense of frequent changes of uniform, as well as from mess, and band, and other regimental subscriptions. Unity being strength, the foregoing arrangement, it is believed, would give not only greater apparent, but greater real strength and visible importance to the department than it has ever yet had; give an *esprit du corps* to its members which they certainly do not now possess; and entitle them, as a distinct body of considerable magnitude and consequence to the state, to the well-merited designation of a "Scientific Corps."

8719. (*Mr. J. R. Martin.*) It has been complained of, that the present medical designations do not indicate the function performed by the officer?—No, the present titles of medical officers are not in the least understood by the public, and that is one reason why their relative army rank, and proper position in society are so rarely recognized. The titles I propose to substitute for those now in use are on this paper, which I beg leave to hand in.

The same was delivered in and is as follows :

“ TITLES OF MEDICAL OFFICERS.

Present Titles.	Proposed Titles.
Director-General - -	{ Surgeon-General-in Chief
Inspector-General of hospitals -	{ Surgeon-General.
Deputy - Inspector-General Hospitals -	{ Surgeon Brigadier.
Staff-Surgeon, first class -	Surgeon-Lt.-Colonel.
Staff-Surgeon, second class and regimental surgeon -	{ Surgeon-Major.
Assistant-surgeon (above five years service) -	{ Surgeon-Captain.
Assistant-surgeon (under five years service) -	{ Surgeon-Lieutenant.

“ The above proposed titles, it will be perceived, designate at once the relative rank and the profession, without the chance of mistake, or the necessity for explanation, while the present titles are in general wholly misunderstood by the public. It will also be perceived that the proposed titles give a step of relative rank throughout, which has been long looked for, and which, I think, will hardly be withheld if there be an intention of improving the position of the medical officers of the army. If the relative rank of captain be conceded to the assistant-surgeon after five or six years’ service, that of major will hardly be denied to the full surgeon, whose position, especially as chief medical officer of a regiment, is one of considerable importance and responsibility, second only to that of the commanding officer. If deemed advisable, however, the surgeon-major (if promoted early), might during the first three years, have the brevet rank only, convertible into substantive at the end of that time.

“ The foregoing proposed titles are nearly, if not precisely, the same as those given to the medical officers of the United States Army, and which are believed to give general satisfaction.”

8720. You have a proposal to make, have you not, as to retirement ?—I have drawn up on this paper a scale for the full pay of medical officers, which, with permission of the Commissioners I beg to hand in.

The same was handed in, and is as follows :—

“ FULL-PAY.—Proposed Scale.

	£	s.	d.	
Surgeon-General-in-Chief -				per annum.
Surgeon-General - -	2	10	0	per diem.
Surgeon-Brigadier - -	1	15	0	do.
Surgeon, Lieut.-Colonel -	1	8	0	do.
Surgeon-Major - -	1	2	6	do.
Surgeon-Captain - -	0	15	0	do.
Surgeon-Lieutenant - -	0	10	0	do.

“ These rates of pay, with an earlier right to retire-and a more liberal retiring allowance than at present, together with increased rank and improved social position, &c., would, it is believed, be sufficient to attract the most talented and highly educated young man into the ranks of the department.”

8721. At what ages do you propose that officers should retire ?—After 20 or 21, 25 and 30 years.

8722. Twenty-one years, in the case of a man who enters the service at 25, would bring him to 46. Has not a man still a number of years of good service left in him ?—Yes.

8723. Then why retire him at that time ?—I would not do so compulsorily.

8724. Why permit him to retire from the service, when he has acquired a good deal of experience, instead of giving it to the service ?—Military officers (at least a certain number annually) are permitted, after 21 years’ service, to retire on full pay.

8725. They are permitted to go on half-pay, after 21 years ; but I presume you contemplate, by retirement, something larger than half-pay ?—Yes, a retired allowance ; it seems to be the general wish ; I do not myself think it would be of any great use, that permission should be given them to retire at this period of service. I would not recommend it.

8726. (Mr. R. Martin.) That would be the usual principle with officers who were incompetent from sickness ?—Yes.

8727. (President.) Is it not wished very much on the ground, that at that age they would be more likely to get into private practice ?—Yes ; and as a means of inducing a better class of young men to enter the service.

8728. (Mr. T. Alexander.) Would many take advantage of it ?—I do not think that many would.

8729. (President.) Do you propose compulsory retirement at a more advanced age ?—I do not think that it should be compulsory ; it might be left to the consideration of the government to compel an officer to retire after 30 years’ service, if he was found to be incompetent for it ; but it might be injudicious to compel a man to retire, after 30 years, when he was perhaps most efficient in his duties, and it might be a hardship to the individual.

8730. Do you not think that things of that kind are better governed by some regulation ; you take the chance, every now and then, of losing an efficient man ; but the government could hardly exercise so invidious a power, as telling one man that he was competent, and another that he was not ?—Very true ; but a man might be of sound constitution at that period of service, and might be too valuable to lose.

8731. Take him at 35 years’ service, and 60 years of age ?—Then, I think he ought to go.

8732. Would you give any additional rank upon retirement ?—I think in some cases it would be desirable, but the present rank is so little known to the public that it is of comparatively little value as an honorary title.

8733. Would not any rank be comparatively little known to the public ; the designation of the medical officer is Dr. So-and-so ; people do not ask whether he is a deputy inspector ?—If such ranks or titles as I have proposed were given they would be better understood by the public, and appreciated.

8734. It will not be known as a prefix to his name ?—I do not see why it should not be.

8735. (Mr. J. R. Martin.) It would then become a habit so to designate him ?—Yes ; the prefix of staff-surgeon and surgeon-major—titles now in use—do not sound ill, neither would those of surgeon-general, surgeon-lieutenant-colonel, &c.

8736. (President.) As to half-pay, have you any proposal to make ?—I have drawn up a scale here which I will hand in to the Commissioners.

The same was delivered in, and is as follows :—

“ HALF-PAY.—PROPOSED SCALE.

Ranks.	After a Service of		
	20 yrs.	25 yrs.	30 yrs.
	s. d.	s. d.	s. d.
Surgeon-General-in-Chief - -	—	—	—
Surgeon-General - -	—	30 0	40 0
Surgeon-Brigadier - -	18 0	25 0	30 0
Surgeon-Lieut.-Colonel - -	14 0	20 0	25 0
Surgeon-Major - -	12 6	15 0	17 6
Surgeon-Captain - -	5 6	6 6	10 0

An additional shilling or two shillings a day might be given to officers of each rank if placed on half-pay by reduction of establishments. Every officer of the corps should have the unqualified (optional) right to retire on the authorized half-pay of his rank after a service on full-pay of 20 years. After 30 years’ service there should be no increase of either full or

George Russell Dartnell, Esq.

13 July 1857.

George Russell
Dartnell, Esq.

13 July 1857.

half-pay, but the latter should be so liberal, and the difference between the two so trifling, as to leave little inducement to an officer to continue longer on the active list. His retirement, however, on the completion of this period of service should not be compulsory, as such a rule might be unjust to the individual, or prejudicial to the service, but at the same time that it were competent to the government to permit an officer to serve a further period, if his services as a public servant were considered valuable; it should also be competent to the authorities, if deemed advisable, to place him on the retired list."

8737. Altering the present scale materially?—Increasing it rather.

8738. Do you make it bear any fixed proportion to the full-pay?—It is proportioned to the length of service.

8739. You do not take so many fifths or three-fourths?—I have taken it from other calculations, as a sort of mean.

8740. Upon what grounds do you augment the half-pay?—I think that it is generally felt by the department that the present half-pay retirement is insufficient for past services, or as an inducement to retire.

8741. You are speaking of it with regard to officers going on it permanently?—Yes, not temporary half-pay.

8742. Do you propose in your scheme to retain the rank of first-class staff-surgeon, or to alter its duties?—I should retain the rank, make it an administrative office, and change the title from staff surgeon of the first class, to surgeon lieutenant-colonel.

8743. What do you conceive it to be now, executive or administrative?—It is sometimes one and sometimes the other.

8744. What was it intended to be when first established?—I understand that it was intended to be executive, I think it ought to be administrative.

8745. Therefore you would have three administrative ranks to administer two executive ranks?—Yes, then the number of staff-surgeons of the first class might be reduced to a sufficient number to act as principal medical officers of small stations where you could not place a deputy inspector.

8746. There are not above 34 or 35 now?—I think not.

8747. Would you reduce them below that number? I cannot say whether it would be necessary or not.

8748. If you reduce them much lower than that, how will the director-general be able to select men for the rank of deputy-inspector; his field would be so narrow that it would be impossible for him to make a selection?—Yes, but I would not reduce them lower.

8749. You have a strong opinion in favour of the retention of the rank of first-class staff-surgeon?—Yes.

8750. You think that it ought not to be abolished?—Yes, I do.

8751. You think it is necessary as an administrative rank?—Yes, I do.

8752. Do you think that when changes are made in the organization of hospitals, by which the medical officer would be relieved of an immense deal of drudgery which now falls upon him, and which ought to be done by the steward, that you would still require so large a proportion of administrative officers as you do now?—I am not prepared to answer that question, as I know not what changes may be in contemplation.

8753. (*Mr. J. R. Martin.*) Would not the deputy-inspector answer all the purposes of a staff-surgeon of the first class?—Yes, of course he would.

8754. The number in any case is not very large, according to your statement?—No, it is not.

8755. (*President.*) Have you put in, with those rates of half-pay, any rates of full-pay?—I have.

8756. You do not know whether they agree with the rates which are mentioned in the Appendix to Mr. Stafford's committee?—I do not know. I have taken them as a sort of mean between the suggestions of others, and the present rates.

8757. You have taken them arbitrarily?—Yes, in some measure.

8758. Do you make larger increases to the upper or lower ranks,—where is the largest increase?—I think in the lower ranks, a proportionate increase in all.

8759. What do you give to an assistant-surgeon on joining?—Ten shillings a day.

8760. Will you state what is the present system of promotion from the rank of assistant-surgeon to surgeon?—Really I cannot say what the rule is.

8761. It is by seniority, is it not?—I believe so, but I really cannot tell.

8762. (*Mr. J. R. Martin.*) Have you any means of knowing whether that rule is departed from?—I have known men promoted over the heads of seniors. I do not know what the rule is.

8763. (*President.*) Are those the cases of men who were senior in certain stations and not senior on the army list?—I am not prepared to say.

8764. There is no warrant, is there, fixing the rule of promotion?—Not that I am aware of.

8765. There are no published regulations?—No, I am not aware of any.

8766. How do you consider that the promotion ought to be regulated from assistant-surgeon to surgeon?—I think it ought to be regulated by seniority.

8767. Do you mean seniority within certain districts, or seniority in the army list?—I think the facilities of communication are now so great that it might be regulated upon general seniority.

8768. If not carried so far as that, a very simple division, say east and west of the Cape, would be sufficient?—Yes, sections of command,—not individual commands, but large sections of command.

8769. Would you propose that the same rule should obtain from the rank of surgeon to first class staff surgeon as to seniority?—I think that, perhaps, might be a case for selection under proper regulation.

8770. Would you say the same as to selection to a deputy-inspectorship?—I think probably after that the promotion might go by seniority again.

8771. The only grade in which you would have selection would be, from surgeon to first-class staff surgeon?—Yes.

8772. If a man utterly failed in his administration when tried, you would not on that account leave him in his rank, but you would equally promote him?—Yes, when it came to his turn.

8773. Do you think that that acts as a wholesome stimulant in the rank?—I do not know that it does; but there might be other means of promoting an officer who distinguished himself,—by brevet rank, for instance,—by that means you would get the best men to the top of the list.

8774. (*Dr. A. Smith.*) If a man utterly failed after he was appointed to the first administrative rank, would you consider yourself justified in passing him over?—Yes, if he was inefficient, certainly.

8775. (*Mr. J. R. Martin.*) That would be not only justifiable but necessary?—Yes, unquestionably.

8776. (*President.*) You have said that you would not object to selection under proper regulation, what do you mean by that?—On fair and sufficient grounds being shown to the Commander-in-Chief for the superior claim of the man to be promoted.

8777. Like the warrant in which the Commander-in-Chief specifies the reasons for promoting a colonel to be a general; you would have the reasons always stated?—Yes, and the names of those given who were to be passed over, and why they were passed over.

8778. (*Mr. J. R. Martin.*) If reasons should be so stated publicly, you think it would do away with much of the discontent and misunderstanding which now exists?—Yes, I should think it would.

8779. (*President.*) There is a very little selection practically in the upper ranks, as the seniors, on the whole, get the best share of promotion?—I think they do.

8780. In the lower ranks you think it more doubtful?—I really am not prepared to say.

George Russell
Dartnell, Esq.

13 July 1857.

8781. (*Dr. A. Smith.*) You do not mean to say that you would make public the reasons why men are passed over and let the whole world know them?—I did not mean that. I meant that the names and claims of both parties should be fairly submitted to the Commander-in-Chief; and that the reasons why a man was promoted much out of his turn might be made public.

8782. To the whole world?—I should think so.

8783. (*Mr. A. S. Stafford.*) That would be analogous to the arrangement as to combatant officers?—Something upon the same principle, the grounds upon which it is done should be stated; I do not mean that the reasons for passing over a man should be made public; I might have said so, but I did not mean it.

8784. (*President.*) Will you explain exactly what you propose to do?—If an officer is proposed to be promoted out of his turn over another, I think that fair and sufficient reasons should be given for that promotion.

8785. To whom?—To the Commander-in-Chief; the names of those who are passed over should also be given to him.

8786. Do you propose afterwards to publish in any way, the reason why the promotion is made?—Not in simple selection for the first administrative rank; but in the case of an officer meriting special reward in the shape of promotion, the Gazette might state, in the same way that it does in the case of military officers,—"For distinguished conduct."

8787. But take the case of the navy, where selection is the rule, without reference to distinguished conduct; they select the men that they think most capable, but no reasons are publicly stated; those selections would have a certain analogy to them, would they not?—The cases for selection would; but the others, as a safeguard, should, I think, be in some way made public.

8788. Take the rank where you propose that the order of promotion should go by seniority, that of assistant-surgeon to surgeon, yet, for very special services in the field, you would, I suppose, allow exceptional cases?—Certainly, such special services should of course be rewarded.

8789. In those cases, you would have the reasons stated publicly?—Yes, I think so.

8790. Do you believe that if the rules were published much dissatisfaction in the profession would be removed, as they would then know under what system promotion was taking place?—Yes, I am sure it would be very satisfactory to the department.

8791. Do you think that brevet rank could be given as a temporary reward?—Yes, I think it might be very well given.

8792. Is local rank ever given?—Yes, local rank is given to nearly all inspector-generals.

8793. The local rank of inspector?—Yes; nearly all our inspector-generals have local rank. When first appointed to a station, they get the local rank only, in which they serve for three or five years; it is then made substantive, and they retire. It is only confirmed on retirement.

8794. What is the length of service of the deputy-inspector before he gets that, three years?—Generally three years, often much longer.

8795. At the expiration of that period he loses his station, does he?—He loses his station if promoted.

8796. And gets the local step of rank confirmed?—Yes, if he gets the local rank of inspector-general, he is moved to another station.

8797. You say the local rank of inspector-general?—Yes, I say the deputy inspector general gets the local rank of inspector-general, and is removed to another station.

8798. To a higher station?—Yes.

8799. When they are moved to another station with the local rank of inspector-general, do they get the pay and allowances of an inspector-general?—Yes, upon that station only.

8800. But the rank is not made substantive before the expiration of a further period?—The third year

abroad, the fifth year at home, and then they retire from the service.

8801. In the cases of reduction upon the termination of war, and restoration to full pay, does that go by seniority?—Reduction from full to half-pay should commence with the junior.

8802. But not the junior of each rank?—Yes, the junior of each rank.

8803. Without reference to his whole service?—I think so.

8804. With regard to restoration, how is that done?—I have no idea how it is done; but I think that every officer reduced should be restored to full pay as he had formerly stood on the list, commencing with the senior.

8805. In the rank or upon the whole service?—The senior in the rank.

8806. But the practice is to take the senior in the service, is it not?—I really cannot tell you.

8807. Have you known it done in both ways?—I cannot say.

8808. Do you hold that in all cases seniority should count by the senior within the rank, and not the senior from the first entry?—In promotion as well as restoration seniority I think, should count within the rank.

8809. Except when you come to retirement?—Yes, that I should count by length of service.

8810. Upon the ground that age operates upon all ages equally the same?—Yes.

8811. In case of a man being selected for merit and being promoted to a higher rank, do not you think that it operates unjustly on him to count his seniority not by his rank, but from his entrance into the service?—Yes; I think it does.

8812. In that way, you would say that all seniority should count within the rank in which the officer is?—Yes; I think so.

8813. Have you any opinion to offer on the subject of the turn of foreign service?—No; I have not given it much consideration.

8814. With regard to the publication of the roster?—No; I have not thought of it.

8815. You have been for some time deputy-inspector, and you have had a charge with inspectorial rank?—Yes, since November 1854.

8816. At Chatham, and formerly at Yarmouth?—At Chatham, and previously at Plymouth; my rank when at Yarmouth was that of staff-surgeon of the first-class.

8817. Did you make confidential reports?—From Chatham I did.

8818. (*Mr. A. S. Stafford.*) How often?—I was required to make confidential reports fortnightly; and, latterly I believe I did; but not always from pressure of duty.

8819. Were those reports upon the comparative abilities of the officers, or were they merely confined to any derelictions of duty or neglect?—They referred to their general capability, their general acquirements, attention, and so forth, the manner in which they performed their duties, and their moral character; my reports were confined to the junior officers.

8820. Had you any occasion to make reports against an individual for misconduct?—On two or three occasions only.

8821. (*M. J. R. Martin.*) Were you precluded by order from reporting upon a senior officer?—No; but the director-general was good enough not to press me on the subject.

8822. (*President.*) Did you when you made a report unfavourable to a man's character, not as to his abilities, but as to some dereliction of duty, communicate it to him?—Yes, invariably.

8823. Do you think that it ought always to be so communicated?—Yes, I do.

8824. By the officer who makes it?—Yes, by the officer who makes it.

George Russell
Dartnell, Esq.
13 July 1857.

8825. Has he then an opportunity of offering an explanation which goes up with your report?—Yes, certainly.

8826. It is not the practice now?—I do not know.

8827. He would have no means of making an explanation of his conduct to the director-general, unless the director-general communicated the report to him?—He could of course only know of his misconduct being so reported from one or other of the two sources.

8828. Do you think that confidential reports are necessary?—I think that they ought to be very valuable documents.

8829. (*Dr. A. Smith.*) So far as you know, is it not the practice, when an unfavourable report is made to the director-general, for him either to address a letter to the person complained of, or to write to the principal medical officer to say something to him?—I believe it is; but I have had no experience except in my own practice.

8830. But in the cases that you have referred to from Chatham, supposing that you did make reports did you receive no communication from me on the subject?—Yes; I know that I did.

8831. (*President.*) To what effect?—Requiring further explanation, I believe.

8832. (*Dr. A. Smith.*) Or to admonish him, or something to that effect?—Yes, in one case certainly.

8833. (*President.*) Desiring you to admonish the officer about whom the report was made?—Yes.

8834. Do you think it necessary for the conduct of the department that the director-general should be informed of the relative merits of the officers serving in the department?—Yes, I think he ought.

8835. At the same time you think that as an invariable rule any unfavourable report ought to be communicated to the officer who was affected by it?—I think so. It would be only fair and honourable.

8836. (*Mr. A. S. Stafford.*) Have you anything to alter or modify in the evidence which you gave before the army medical department committee in 1856?—No, I do not think I have.

8837. (*Mr. J. R. Martin.*) Do you think that something in the form of a good service pension ought to be given to meritorious officers in your department?—I think it would be a very great boon, and be very useful as a stimulus to exertion, as well as a graceful reward for faithful and meritorious service.

8838. Do you think that something analogous to the honorary distinction of aide-de-camp to the Queen might be conferred upon the surgeons in the army?—Yes; I think such an honorary title as “surgeon aide-de-camp to the Queen” would be very highly prized, and be a means of elevating the social position and importance of the military medical officer.

8839. (*Mr. T. Alexander.*) Do you think that the title of honorary surgeon or honorary physician to the Queen would not do equally well?—Yes, I suppose it would, but the other would better imply a military medical officer, and accord with the other titles I have proposed.

8840. (*President.*) Do you think that sufficient attention is paid to sanitary measures at present in the army?—I do not think there is sufficient attention paid to the subject.

8841. Would you recommend any change in that respect?—I would strongly recommend the appoint-

ment of local sanitary boards or committees in every large garrison and camp, with a central board in London to communicate with, and receive instructions from.

8842. (*President.*) As a part of the director-general's office?—Yes.

8843. How would you compose a board in the particular county?—The board in the country should be composed of two medical officers, an engineer officer, if possible, and perhaps a military officer.

8844. Who should examine into the whole locality?—Their duty should be to examine into everything connected with the hygiene, and sanitary condition of the station. The drainage, and state of ventilation of the barracks and hospitals; and to inquire into the causes of any particular local sickness or epidemic. They should also be invested with authority to call for plans of buildings and drainage, &c.

8845. Have you found that medical officers offering suggestions upon sanitary points are readily listened to by the officer in command?—In some cases they are, and in some cases they are not; a good deal depends upon the character of both officers.

8846. (*Mr. J. R. Martin.*) It depends upon chance, in fact?—Yes; commanding officers are often very slow in listening to anything of the kind.

8847. (*President.*) Should it be made a matter of regulation that the medical officer should be consulted, and that he should give his opinion in writing?—I think it very desirable that more importance should be attached to the opinion of medical officers in this respect; and in large garrisons and stations the formation of sanitary committees would, I am sure, be exceedingly useful.

8848. (*Mr. J. R. Martin.*) It has been suggested to the commissioners, that an individual officer of health should be attached for the sanitary service of the army in peace, and in war would that answer the object which you have in view in place of a board—a highly qualified medical officer?—Yes; I suppose it would at head quarters.

8849. For field service suppose he were attached to the quarter-master general's department, one person would suit best there?—Yes; probably, he would.

8850. (*Dr. A. Smith.*) Do you consider, if such an appointment was made of a principal sanitary officer for the whole army, that that officer would not be getting into constant collisions with the principal medical officer, the one being totally independent of the other?—It might be the case certainly, but with a committee, such as I have proposed, it could not well happen; the principal medical officer might, perhaps act as president of the board.

8851. Do you think that a sanitary officer attached to the army would ever do much good if he was entirely independent of the principal medical officer of the army?—I think that they would be very likely to come into collision, if the one was entirely independent of the other.

8852. (*Mr. J. R. Martin.*) That would not happen if he reported to the principal medical officer, and co-operated with him for the good of the service?—I suppose such an officer were appointed, he should not be independent of the principal medical officer; better perhaps, attach him to this department, than to the quarter-master general's.

The witness withdrew.

Henry Mortimer
Rowdon, Esq.

HENRY MORTIMER ROWDON, Esq., examined.

8853. (*President.*) In what capacity did you serve at Scutari?—As civil surgeon.

8854. From whom did you receive that appointment?—From the Secretary of State for war, on the nomination of the director-general.

8855. What position had you previously held in the medical profession?—I had been lecturer on anatomy,

at the Middlesex hospital, for nine years; and member of the Weekly Medical committee of the hospital, for six years; I had also been engaged in private practice, in London, for 15 years.

8856. In what military hospital in the East did you do duty, and from what dates?—In the barrack hospital, at Scutari, from March 28, 1855, to February 1, 1856.

8857. What was the nature of the duties that you had to perform there?—I had the entire charge of an average number of 100 beds; and by order of the director-general, I was subject to no other supervision than that of the inspector-general, the principal medical officer of the station. By the authority also of the director-general, an acting assistant-surgeon and an hospital dresser were placed under my direction, to carry out the proper attendance on the sick.

8858. How did such a novel expedient work in with the usual routine of the hospital?—Very simply and effectively. The barrack hospital consisted of four divisions, each division containing about 400 beds; in every division there was a separate administrative officer, namely, a first-class staff surgeon, and several executive officers, comprising, however, but *one* second-class staff surgeon, and a number of junior medical officers, the large majority of whom were acting assistant-surgeons, and hospital dressers. Above the first-class staff surgeons was the deputy inspector-general, and above him the inspector-general, who was the principal medical officer of the station. I was appointed to duty in the fourth division, a section of which, containing about 100 beds, was allotted to my entire charge and responsibility. The first class staff surgeon of that division had nothing further to do with my wards than to send in patients, and discharge them when convalescent, according to the usual rules of the service.

8859. From the opportunities for observation which you then had, did you consider the system of administration, and the general efficiency of the department, equal to what were required or expected?—No; I thought that there were very many defects; my evidence in explanation of that belief, may be referred to three principal heads, namely:—first, the general administration of the department; secondly, the distribution of professional duties among army surgeons; thirdly, the want of sufficient control and authority of the executive officers. The administration of the business of the hospital appeared to me to be greatly impeded, by the want of proper representation to the principal medical officer, by the executive medical officers, of the condition of the wards, and the wants of the patients.

8860. On what grounds did you form that opinion?—From the fact, that on my taking charge of the wards assigned to me I found a great deficiency of proper bedsteads, bedding, clothing, medicines, and other necessaries. All those articles were in the stores of the same building; and when I expressed to the acting assistant-surgeon, and dresser, previously in attendance upon the sick men, my surprise that they had not sooner obtained the different articles referred to, they told me that requisitions for them had been previously made, but without effect.

8861. What do you consider to have been the cause why those requisitions were not attended to?—The acting assistant-surgeon was a very young man, who had passed the College of Surgeons only just before his appointment to duty at Scutari, and the dresser had passed no examination whatever, not having nearly completed his medical education. As there was only one executive officer of higher rank throughout the whole division, these young gentlemen had treated the sick and prescribed for them conjointly for some time before my arrival: I concluded that they had not been considered sufficient authorities as to the necessity of the things applied for. It was, moreover, required by the rules of the service that requisitions made by any executive officer should be approved and countersigned by the first-class staff surgeon, though the latter, from not being in personal attendance upon the sick could hardly judge so well as to their necessity. In the event of any obstacle occurring through the circuitous form required, such as the absence of the first-class staff surgeon, or the document not passing through the proper channel, a great deal of confusion and suffering were occasioned. The executive officers had no power to make known their wants to the principal medical

officer; in fact, they were expressly forbidden to do so by an order that appeared in the departmental Order Book.

8862. Do you consider that that rule of the service was a useful or necessary one?—No; I believe that it operated practically as a discouragement to the medical officers in charge of wards from making known many facts that it was of the highest importance the principal medical officer should have been acquainted with, at the same time without securing any advantage either as to economy or convenience. But what was of still greater consequence, it acted obviously to the disadvantage of the sick men.

8863. Do you consider then that the present practice in regard to requisitions, reports, &c., might be simplified with benefit both to the service and the sick?—Yes, I consider that the executive officer in charge of wards should be responsible in his own department, and should possess the power to meet emergencies as they arise; for the judgment and discretion with which that power is exercised, he should be responsible to the principal medical officer. I also consider that the regulations of the service should not only permit but encourage direct communication between all executive officers and the principal medical officer, so that by providing for explicit representation to him, the ultimate responsibility should be limited as much as possible to the principal medical officer. This change would, however, require for its successful adoption other concurrent changes, to insure increased efficiency and professional ability on the part of all junior medical officers.

8864. Can you mention any facts to bear out the opinion which you have stated?—Yes; I am supported by the fact, that the very great deficiencies which existed in my wards when I took charge, were immediately remedied, to the great benefit of the sick, by the direct communication which I, as a civilian, was permitted to make to the principal medical officer, and by the power with which, as an independent executive officer, I was enabled by the directions of the director-general to give full effect to my opinion on professional and sanitary matters, without any interference, or any other supervision than that of the principal medical officer.

8865. Can you state any facts that occurred during your subsequent service in the barrack hospital to show the disadvantage to the soldiers, and to the service, of the present system, in the management of army hospitals?—Yes, especially in regard to the ill effects of withholding certain facilities from the executive army surgeons which were conceded to civilians. In my monthly report for July 1855, which I had the privilege of sending direct to the inspector-general, I felt it my duty to add a special letter (a copy of which I beg permission to hand in), calling his attention to the large numbers of broken windows in my wards, after repeated requisitions had been made for their repair. Many of the men had suffered severely from the cold and wet at night, blowing directly upon the heads of their beds, several beds having a window without a single pane of glass in it, within a few inches on either side of the bed. Although I had frequently shifted the men who suffered to other beds, the men newly exposed suffered in the same way. This will be more readily understood when I state that those patients were admitted into the hospital with rheumatism, ague, dysentery, pleurisy, pneumonia, &c. The stay of those patients in the hospital, at the time, too, when by all accounts they were much wanted at the front, was greatly prolonged by the exposure to which I have referred, and apparently on the ground of an expense not exceeding half the daily cost of the men so detained in the hospital. I therefore felt it my duty to represent the matter as emphatically as I could to the notice of the inspector-general, the result was that the inspector-general visited my wards in person, and, having ascertained by the condition of the men that my complaint was well-founded, the necessary directions were given, and within three days all the

Henry Mos timer
Rowdon, Esq.

13 July 1857.

windows were mended, to the infinite relief of the men. The state of the windows over the whole hospital was, however, pretty much the same: some better than in my wards, and some infinitely worse. Those in my wards were the only ones that were mended, even under the palpable evidence of the same want of repair. I was therefore forced to the conclusion that none of the executive army surgeons would have been allowed the same immunity in making the earnest representations that I had found imperative, or whose persistence even in such a matter of duty, would have been otherwise than to their disadvantage.

8866. Upon whom were the requisitions made which failed to obtain things before you applied directly to the principal medical officer?—To the purveyor, and they should have been forwarded by the purveyor to the engineer.

8867. Upon what grounds did he refuse them?—It would be hard for me to say what his reasons were; my belief was that the matter could not have been thoroughly brought to the notice of the principal medical officer, and without his express approval such requisitions would not be attended to.

8868. Also there was the difficulty that the requisitions required the counter-signature of the administrative officer?—Of the intermediate administrative officers, which were not in all cases given; it frequently happening that they were absent or ill or in passing through a number of upper grades before reaching that of principal medical officer, they were to a certain degree qualified or burked, so that they did not ultimately take effect.

8869. Can you state any further facts to show that the control of the intermediate administrative officers, that is, the first class staff surgeons, over those engaged in the actual treatment of disease, is prejudicial to the sick, and opposed to the true interests of the army medical department as a service?—Yes; the first-class staff surgeon of the division to which my wards belonged, among other regulations issued orders to the ward masters and orderlies to wash and scrub the floors of the wards on three fixed days in the week, and all the other woodwork on the alternate days, without reference to the opinion of the surgeon in attendance, to the nature of the cases in the wards, or to the state of the weather. My attention was first drawn to the subject on the day this washing commenced by finding the floor round the beds of the sick men perfectly wet at 8 o'clock p.m., when I paid my evening visit. A single glance at the nature of the cases might have convinced any one who really cared about the result of the medical treatment, that such a proceeding was most injurious to the patients. The unfavourable effects of washing the floors of wards containing sick men in bed, and the damp engendered by the slow process of drying where there no fires, especially in cases of fevers, rheumatism, erysipelas, and pulmonary diseases, are well known to all experienced medical officers. The practice is, moreover, expressly forbidden by the War Office regulations of 1854, page 24, article 50; I therefore wrote an official letter to the inspector-general (dated September 13, 1855), pointing out the ill consequences on some particular men, and requesting his further instructions on the subject. He at once concurred in the inexpediency of the practice, and it was discontinued in my wards only. The executive medical officers in the other wards of the division did not possess the same powers of appealing, without prejudice to themselves, to the principal medical officer, and they were by the same fact relieved from the responsibility which attached to the proceeding. I should state that from first to last no similar regulations were made in the three other divisions.

8870. Similar to what?—As to washing the wards. To express further my honest opinion on these matters, I must say that as far as my own observation extended, it always appeared to me that more care and anxiety were shown to exhibit a clean outside that to secure the most skilful treatment of

disease, or the most successful sanitary conditions. Even in regard to the inspections which I witnessed, with but a single exception, less examinations were made of the diseases in the ward, of the length of stay of men in hospital, and of the result of treatment in leading to recovery or the reverse, than of comparatively unimportant matters of routine.

8871. You have given it rather to be inferred by your answers to the previous questions that medical officers had abstained from representing the wants of their wards in the manner that you did, from the fear that a proceeding of the kind on their part would have operated injuriously to them?—Yes

8872. In what way would it have operated injuriously?—I could give one very distinct instance of the ill effects which did follow where such representations were made, if the Commission wish. It relates personally to myself. I beg that it may be distinctly understood, that I do not refer to it in any shape as a grievance, but I simply speak of it as a matter of fact, in answer to your questions. I was employed at the barrack hospital from the 28th of March 1855 to the 31st of January, or the 1st of February, 1856. During the whole of that time (and I speak of it now as a matter of fact, not claiming any merit for simply doing my duty) I never slept out of the hospital, neither did I omit one single visit, morning and evening, throughout the whole time of my service there. I fortunately never had an hour's illness, and I never applied for an hour's leave of absence, and no complaint was ever made of the way in which I performed my duties there. On the contrary, I had frequent expressions of thanks on the part of the principal medical officer latterly in charge there of the manner in which I performed my duties. When instructions were sent out to the commandant of the station that five of the civil surgeons might be relieved from duty, one of the five so selected was myself, who was well known from good health and other reasons to have never been absent from my post at the time of duty; it was also well known that of those who were left behind, that is to say, civil surgeons, one had been incapacitated for a period of eight consecutive months from illness, and who at that time was not attached to any duty, I being actually in charge and in daily attendance on upwards of 100 men; yet I was withdrawn from the service, and, if I had so regarded it, subjected to the consequent discouragement and loss of pay; but I did not so regard it. I speak it now simply as a matter of fact, and not as any hardship. But on my return to England (and the Director-General will, I have no doubt, permit me to state what took place) I naturally was anxious to obtain from him an expression of his approval of the way in which I had performed my duties, and which I trusted had been made known to himself. The Director-General, although extremely courteous to me on the occasion, distinctly withheld from me a single expression of thanks, for that reports had reached him of the trouble that I had given, and which I concluded was the trouble of having honestly and to the best of my ability done my duty in making representations which were proved to be for the benefit of the sick men, and Dr. Smith distinctly declined to give me any expression of his approval of the way in which I did my duties. Without troubling yourself or the members of this Commission with any further statement, I did think, from the very fact, which nobody could call in question, of my never having been absent from my post from any cause, and never having slept out of the hospital, that I was entitled to such approval for the way in which I did my duty. Without regarding it as a grievance to myself, I did feel that if such a system was taking effect in the army, it must be greatly to the disparagement of the medical officers, and to the infinite damage of the sick soldiers.

8873. You are arguing now from a single instance in which you must guess at the motive; did you ever know other cases, or did you see any alarm on the part of the junior army medical officers, that if they

made those representations as to their patients it would be held that they had been troublesome and making difficulties?—Yes, I did. It was most unequivocally expressed on their parts; it was not done in so many words, but when I frequently said, “How is it that you do not represent these things?” a shrug of the shoulders implied, more strongly than any words that they could have used, the real causes operating in their minds.

8874. (*Mr. J. R. Martin.*) Their dread of being considered troublesome men?—Yes, the remark of being troublesome was applied to me repeatedly by the Inspector-General, though my letters to him, which must be extant, were couched in the most courteous terms I could use.

8875. (*Dr. A. Smith.*) You have made some reference to my having refused you a certain document which you particularly desired. I do not exactly recollect the circumstances of that refusal; will you state a few circumstances connected with that interview, so as to enable me exactly to recollect what was the object of the interview, and what was the reply that I did give you?—I did not ask for any document, but simply for the verbal expression of your approval, that you declined to give me; it was a very short interview. I called at your office; you were standing at your desk. I called to report myself, and to state that I was ready to return to my own duties in London. I simply expressed my hope that you were satisfied with the way in which I had performed my duties, and you distinctly said, “No sir, I cannot say that I am, for reports have reached me stating that you have given a great deal of trouble, and if it is any document or any paper that you wish me to sign I shall decline it.” On hearing that, I expressed to you, that I was sorry to find that I had not been fairly represented to you. I further said that I had no doubt that if I had been indifferent to the wants of the sick, and only consulted my own pleasure by dining over at Pera every other day, and, as in a case in point, in getting tipsy every other day in the week, I should have been considered a very good fellow, and would have been left to the enjoyment of my appointment as long as I could have it; but because I had done otherwise, because I had done my duty, and endeavoured to induce those under me to do theirs, I had been held up to you as having been troublesome.

8876. (*Sir J. Clark.*) You are aware that your evidence is being taken down? Do you adhere to your statement as to tipsyness?—Yes, I am quite clear as to that.

8877. (*Dr. A. Smith.*) Do you mean to say that I said to you, “If it is any document or any paper that you wish me to sign I will not do it;” I did not volunteer that observation, did I?—Yes. You said that in reply to the expression of hope on my part that you were satisfied with the way in which I had done my duty; you said, No, you were not satisfied.

8878. Did I say directly to you, without your having asked me to give you some document, “If you want me to sign any document or any paper I cannot do it;” did I volunteer that?—Yes. Directly you volunteered that I said that my request was simply made to you for an expression of your private opinion. I had no desire whatever, as I was well known in London, for any document to go outside your room. I made that remark to you at the time.

8879. With reference to the grounds on which I formed my opinion, had you any reason to believe that when I formed my opinion and stated, if I did state, that I was not prepared to give any document of that kind, that I did so because I was dissatisfied with your having exerted yourself to effect improvements, which evidently you did with great advantage to the public service?—You did not state that, because I believe at that time you were not acquainted with it, but you did say that other reports had reached your ears. I asked you to let me know what they were, but you declined to do so.

8880. You are aware of the reports, are you not?—No.

8881. You are aware that General Storks was called in to settle the matter; there was something like a cabal; very high words were used by you and the officer who found fault with you, namely Dr. Macgregor, on the occasion of the squabble that took place in the wards, and it must have produced a very bad effect upon the soldiers in the wards to hear two gentlemen in altercation, and using very high words. That matter was settled by General Storks, and did not require me to interfere further?—That matter was settled chiefly by yourself. I have a letter from you exonerating me from blame on that occasion; and I can refer to a letter from General Storks to Lord Panmure referring to that subject, and which he read to me after he had sent it, in which he stated that Dr. Rowdon had behaved in the most becoming manner.

8882. On that occasion?—Yes; the date of that letter was Sept. 27th, 1855, and your letter bears date Sept. 11th, 1855.

8883. When I said that was my reason—not that I recollect it, but I do not doubt it, as you say I did so—for refusing any written document, are you not aware that the very first civil surgeon who came home, I think, asked me for some document of the kind, and I said, No, it is difficult; there have been different degrees of efficiency shown by different medical officers in the East; therefore if I were to give each man who asked me a document, I should find that I should have to give to some a much more satisfactory one than to others; and, therefore, I made up my mind to give none; but if any gentleman who served in the East made an application for a document and stated as his reason for making his application that he was an officer about to seek the charge of a civil hospital in this country, I would state what facilities he had had of making himself acquainted with hospital duties, and that I thought it must have been an advantage to him, but I gave no civil surgeon, or ever consented to give any civil surgeon, a general certificate; are you aware of that?—No, I was not aware of that. I hope I may say in very few words that I speak of this in answer to a question as to a matter of fact; I felt perfectly convinced at the time that I had not been fairly represented to Dr. Smith; but I did not regard it as a grievance from him; I felt that Dr. Smith was acting honestly, and to the best of his belief; and at the same time, as far as such a qualified opinion went, I met with the greatest possible courtesy to myself.

8884. (*President.*) You have stated what facilities you had for communicating with the principal medical officer, and the readiness with which he attended to your solicitations; but you were of opinion that the medical officers of the department durst not, for fear of the inconvenience and disadvantages that would result to themselves if they had proceeded in the way that you did. If you received thanks on account of the manner in which you discharged your duty, do you not think that that was an evidence that those who thanked you were prepared to encourage men to do their duty, and that they would also have thanked the officers of the department who had exerted themselves to do theirs, rather than treat them undeservedly because they had proceeded as you did?—The thanks which I received were not given by the Inspector-General, to whom my representation of defects had been made. He had returned to England and was succeeded by Dr. Linton. The principal medical officer expressed personally his sense (to use his own terms) of my services, and his great regret that I should have been called away so soon; for if it had been left to him to recommend, I was the last man that he would have parted with. That was Dr. Linton, and a written note was sent to me by Dr. Cruikshank, who was next in rank to him, to the same effect.

8885. You were thanked for the manner in which you had discharged your duties?—Yes.

8886. You were thanked on account of your having discharged your duties efficiently, I suppose?—Yes.

Henry Mortimer
Howdon, Esq.

13 July 1857.

8887. Then if that officer thanked you, do you think that it was natural that he would not have thanked an officer of his own department if he had done his duty efficiently?—Yes, but the officers of his department, from my experience, had not the same facilities for doing their duty by representing the wants of the men, and urging attention to those wants, because there was one between the principal medical officer, Doctor Linton, and a man like myself, namely, a first-class staff surgeon.

8888. (*Mr. J. R. Martin.*) Which acted as an impediment?—Yes.

8889. (*Dr. A. Smith.*) You have left it to be understood that those other officers did not make the proper representations, and they abstained from making them in consequence of the fear of the consequences if they had made them?—That was my belief.

8890. You were thanked for having done your duty, why should they not have expected to be thanked also?—I was thanked privately on the spot, but the approval which army surgeons most regard in connection with promotion, viz., that of the Director-General, was nevertheless withheld from me; and I conclude would have been similarly withheld from army surgeons under the same circumstances.

8891. (*President.*) You consider that you were independent and they were not?—Yes. If I had been in the service, there is great doubt whether I should have been thanked at all. Certain it is that it would have been to me a disadvantage. If such had not been the general belief how could such a condition of things have been permitted to exist as did exist at the time that I took charge?

8892. You had your wards put to rights, when officers of the same rank could not get similar advantages for the sick in their wards?—Yes.

8893. (*Dr. A. Smith.*) What right have you to say that it was fear on the part of those officers which prevented them from representing their wants?—There were many matters expressed personally and privately which, while they conveyed sufficiently the motives under which men acted, can hardly be made the subject of examination.

8894. (*Mr. A. S. Stafford.*) That was your impression from conversation?—Yes.

8895. (*President.*) With regard to professional treatment, by what means do you consider the professional treatment of the sick might be more efficiently carried out in the army hospitals?—By entirely changing the present distribution of duties among army surgeons, namely, to diminish the number of administrative or superintending surgeons, and to increase the number of executive surgeons. Also by abolishing the authority which medical officers of the different grades possess over those of an inferior grade, with the exception of the supreme authority which the principal medical officer should exercise over all medical officers acting under his inspection or supervision. At present there are no less than five different grades or ranks among army surgeons, namely:—Inspector-general, Deputy inspector-general, First-class staff surgeon, Second-class staff or regimental surgeon, and Assistant surgeon. To these, during the late war, were added, Acting assistant-surgeons, and Hospital dressers. As a general rule, to which there were but very few exceptions, the medical officers of the three higher grades were exclusively engaged, at Scutari, in administrative duties. So that the treatment of disease, and the management of the sick, devolved upon the two junior grades. Of these the second-class staff surgeons were so few in number, from the necessity that existed for the employment of all available men of that class for regimental duty, that in the barrack hospital only one was attached to each division of about 400 beds; a very large portion of the duty of prescribing for the sick fell on the youngest officers, most of whom were acting assistant-surgeons and hospital dressers. By that custom, in regard to professional duties, it will be seen that those medical officers who by their previous experience as regimental surgeons might reasonably be considered the best qualified to distinguish

and treat diseases, and especially to guard against the lingering or prolonged stay in hospital on other grounds, were the least available for those important objects. It always appeared to me, both from my own observation as well as from admissions that I have heard made, that strictly professional duties were rather held in disparagement by senior army surgeons, and that the great object of their ambition seemed to be to cut as short as possible the period for the performance of those duties, and to strive for promotion to the rank in which they would be engaged in superintending and directing others, perhaps scarcely at all, if in any degree, less qualified than themselves. In civil hospitals, as indeed universally in civil life, medical men of the very highest attainments, men of acknowledged pre-eminence and of world-wide reputation, such men as our Astley Coopers, our Brodies, our Brights, and our Watsons, to the most advanced period of their lives have regarded the treatment of disease, and the simple alleviation of human suffering, to be the highest prerogative of their art, and the greatest honour and object of their lives. As the medical department can never become other than an essentially civil department attached to the army, so it must always be subject to the same principles, for its regulation, as those which govern the same profession in civil life. It would, I believe, conduce immeasurably to the advantage of our sick soldiers, as it would undoubtedly to the credit and true interests of the medical department as a service, if the same rules for professional exertion were held in view in the army.

8896. What plan do you recommend for carrying out the changes you have alluded to?—The first and most essential step would be to give full effect to the principle of competitive examination for admission into the service, so as to secure a body of medical officers of high professional qualifications who would no longer require the same amount of direction and supervision that has hitherto been considered necessary for men of their class. The next step would be to appoint such men on their first admission into the service to do duty at Fort Pitt, or some other large military hospital or station, for two years in the rank of assistant-surgeons, with the view of their becoming acquainted with the peculiarities which are said to belong to medical duties as distinct from those of civil life. After having done duty as assistant-surgeons for two years, and if possible with attendance upon lectures on military surgery, I would recommend that such men should be promoted to the rank of surgeon, and be appointed from that rank by the selection of the director-general to regimental duty.

8897. In what period?—Two years.

8898. On what ground do you recommend such a short period of duty as assistant-surgeon, and such early promotion to the rank of regimental surgeon, as compared with past custom?—Because, in the first place, men who have proved their professional competence and, indeed, their superiority, by passing a severe *bonâ fide* competitive examination, would not for a longer period be content to be under the same control and authority, or to be engaged in the same course of duties, as assistant-surgeons are, by the present War Office regulations and by present usage. The control and authority of one grade or rank over another, to be useful, should always be derived from superior professional claims. On any other principle men will never be disposed to yield any useful or effectual deference, even though they may be compelled to make an outward show of it. They may be made to go through a certain form and routine of duty, but without admitted professional superiority on the part of those invested with power, and to whose orders and directions they are subject, the professional services of subordinate medical officers, as far as my experience has informed me, have always been less effective and less beneficial to the suffering men, than when free scope and independence have been given for the unfettered exercise of professional ability. In the second place it is well known that, according to present usage, if

the assistant surgeon of a regiment is a reasonably good man, it is frequently the custom for the surgeon to divide the patients equally between himself and the assistant-surgeon. Equal competence and equal share of duty might with great advantage be attended with equality of rank and of responsibility. If such a regulation were made, it would serve to infuse the true spirit of competition, which is found such a powerful inducement to exertion in civil life.

8899. Do you consider it desirable that all executive medical officers should be placed on the same footing? —Yes: in all professional matters they should have the same control, and, of course, with it the same degree of responsibility, subject, nevertheless, to the full authority and supervision of the principal medical officer, who would be either an inspector-general, or deputy-inspector-general, or in cases of emergency, the senior executive officer. I believe that if you place confidence in men so far entitled to it as those must be who have passed a strict competitive examination, and let them feel their full responsibility, they will labour with far greater zeal, and to much better purpose, than if they are compelled to linger on in a subordinate rank and sphere of duty during the best years of their lives, without any corresponding advantage.

8900. Do you mean to say that you would recommend no distinction to be made between executive officers of 15 years standing, and those of two years? —No, I would make considerable distinction, but not by placing the latter under the orders and directions of the former—or in other words by spoiling both, to the detriment of the sick publicly committed to their care. I would regulate the distinctions so as to raise the senior, without degrading or keeping down the junior, namely, by confining the distinctions to pay and professional standing—the latter having reference to personal reputation and status. In regard to pay, if an assistant surgeon commenced with 7s. 6d. per diem, to be increased on promotion to full surgeon after two years, to 10s. per diem, after 10 years' service I would suggest that it be increased to 15s., and after 15 years' service to 20s., with no further increase until promotion to the rank and administrative duty of deputy inspector-general; and half-pay to be according to the same proportion.

8901. What distinction would you recommend with regard to professional standing, and relative army rank? —All executive officers under 12 years' service to hold the relative rank of captain with the same allowances, and with the title of regimental or staff-surgeon; all executive officers above 12 years' service, to hold the relative rank of major with the same allowances, and with the title of senior staff-surgeon.

8902. How would you adapt those distinctions to the present state of the service? —Assuming that there are but few first-class staff surgeons under 15 years' standing, the changes referred to would admit of ready application. The titles of first and second class staff, which have always been found objectionable, would be abolished, and those officers at present holding the title of first class staff surgeon would hold instead that of senior staff-surgeon, with the same relative army rank as at present. The difference that the proposed changes would make in regard to officers of this grade would be a slight increase of pay and that their duties would be entirely executive and not administrative. In the case of the next grade, viz., the regimental or second-class staff surgeons, those officers under 12 years' service would retain their present relative army rank and allowances, namely, those of captain; and the officers above 12 years' service would hold higher relative rank and allowances, namely, those of major. In regard to pay, those above 10 years service would have an increase of 2s. per diem, and those above 15 years of 7s. per diem. The increase in the latter instance would be an equivalent for the increase of pay which officers above 15 years' service would receive on promotion to the rank of first-class staff surgeon now proposed to be abolished. Some few instances, no doubt, exist of full regimental

surgeons under 10 years' service, who at present receive 13s. per diem. In such cases as now exist, and which will shortly disappear, it would be desirable that their pay should be uninfluenced by the proposed changes. In respect to title, those officers attached to regiments under 12 years' service would hold the same title as at present, those above that service would be called senior surgeons. Those officers of that grade on the staff and under 12 years would be simply styled staff surgeons, and those above 12 years would drop their present somewhat disparaging prefix of second class, and become senior staff surgeons. With regard to the next rank, the present assistant-surgeons above one or two years' standing would have their pay increased by 2s. 6d. per diem and be promoted to the rank of full surgeon, with the relative army rank and allowances of captain. These rates of pay are based on the supposition that the increase of pay to army surgeons generally, which has been advocated on all hands, and which was specially recommended by the late select committee, is now about to be carried out, and the above-mentioned figures are recommended simply to carry out the object of providing due distinction and remuneration to medical officers in proportion to their length of service, without placing one grade under the authority of another.

8903. How do you consider these changes would lead to increased efficiency in the treatment of the sick? —The number of executive officers would be largely increased by the addition of the present first class staff surgeons, who from their mature years, and the experience they must have obtained as regimental surgeons, would be highly qualified for active professional duty. I also believe that great additional strength would result to the service by duly encouraging and raising to a position of greater professional independence and power the other medical officers of the service. For all purposes of discipline and supervision of professional conduct, I believe the authority of the principal medical officer in charge of hospitals and divisions would be amply sufficient.

8904. What other changes would you recommend with the same view? —A reduction and condensation of all accounts, returns, reports, and registers now required by the War Office regulations, page 36, to be kept by medical officers. Many of these, such as the 4th, 5th, 6th, 10th, and 11th, might be advantageously transferred to the stewards and wardmasters of the medical staff corps (1855), who hold respectively the rank of serjeant major and colour-serjeant. Others, such as the 2nd, 3rd, 7th, and 9th would naturally fall to the hospital registrars, the appointment of which officers has been previously recommended. In regard to No. 9 in these returns, my own experience would lead me to believe that it cannot be either necessary or useful to keep a detailed history of every case of disease, with the treatment employed, and a daily entry of diets and extras. I have frequently given up a great deal of time to writing out these registers, but with the full conviction at the time of doing so that they would never be looked at, and that it was lost labour. It would be unreasonable to suppose that any inspector could wade through a daily register of such a mass of cases, yet for want of a judicious selection a good deal of valuable matter has been allowed to run to waste. I would, therefore, recommend that only such cases should be minutely registered as the medical officer in charge should think expedient, subject to the approval of the principal medical officer. The cases so selected should be minutely registered by the hospital registrars, and would, together with the other returns and reports kept by him, prove of great value, with a view of supplying a continued series of army statistical records.

8905. What returns and reports would you still recommend to be kept by executive army surgeons? —First, a letter book for the purposes expressed at page 36 of the War Office regulations; secondly, a morning state of the sick in hospital, and death reports, to be written out by the wardmaster and signed by the

*Henry Mortimer
Rowdon, Esq.*

Henry Mortimer
Roudon Esq.
13 July 1857.

medical officer in attendance; thirdly, a weekly report of the condition of the wards, and the progress of cases, enumerating the admissions, discharges, the total number treated, and those remaining under treatment; this weekly report to be sent to the principal medical officer for his examination, and then to be forwarded to the hospital registrar; fourthly, daily diet rolls to be filled up in figures by the ward-master, and in words by the executive surgeon, and signed by him.

8906. Do you think it desirable that a daily record should be kept of the treatment of patients?—Yes; such a record might be readily made by having at the head of every bed, besides the admission card containing the name of the patient, &c., a long card on which all prescriptions should be written by the surgeon in attendance at the time of visiting the sick. Those cards would be used by the dispensers for making up the medicines, and would be replaced at the heads of the beds. They would thus at all times be ready for reference as to previous treatment, especially on the occurrence of a change of medical officers, and also for the examination of the principal medical officer. The fact of all treatment being so recorded and ready for reference at the head of the patient, would probably prove an incentive to the utmost zeal and exertion on the part of the medical officer. Those cards would also furnish the registrar with the necessary data as to treatment and its results, in such cases as may require to be fully detailed.

8907. What do you consider would be the chief advantage of the change which you have suggested in the mode of keeping returns and reports?—That medical officers would be spared a great deal of non-professional and unprofitable labour, by which means their exertions might be concentrated on the direct management and treatment of the sick. At the same time by providing for the due condensation, classification, and registration of hospital returns and reports, a large amount of information of an infinitely more reliable and useful nature than has hitherto existed, would become available for the construction of army hospital statistics.

8908. Is it your opinion that the changes you have mentioned would enable army surgeons to attend, with due regularity and efficiency, a greater number of sick than they can do under the present system?—Yes; on the principle of the proper division of labour, better results would be obtained, and the economy of the service in the end greatly promoted.

8909. During your residence in the barrack hospital at Scutari, did you observe any causes not yet mentioned which tended to frustrate medical treatment and retard the recovery of the sick?—Yes. The duties of the hospital sentries were very inadequately fulfilled in regard to the objects expressed in the War Office regulations, page 25, article 54. This was particularly observable in the want of proper regulation of the latrines. These latter were paved with stone, and were not only kept constantly wet by ablutions, but were also necessarily open to continuous currents of air at all seasons of the year. The men in hospital were, nevertheless, permitted to make them a lounge during several hours of the day for the greater convenience of smoking and other things forbidden in the wards; men becoming convalescent from diarrhoea, dysentery, fever, rheumatism, and pulmonary affections, frequently suffered relapses from the above-mentioned cause. I represented the evil more than once, but from some cause which I could not ascertain, the difficulty was never remedied.

8910. Did you consider that the medical department had sufficient independent authority in the and similar matters?—No; questions involving the sanitary condition of the troops, the preservation of health among the able-bodied, and the complete recovery of the convalescents, come as fairly under the consideration of the medical department as the mere treatment of disease. It will, therefore, be to little purpose that by aid of the improvements which are taking effect in other departments of the army, our

troops become the best trained, the best armed, the best clothed, and the best fed soldiers the world has yet seen, if greater effect is not secured to the knowledge and skill of the medical department in averting the outbreak and spread of disease as well as to the most ready and efficient treatment of the sick and wounded. These all-important objects can, I believe, be only carried out by the institution of an officer of health to the army, holding such rank as would enable him to secure the consideration and fulfilment of those objects. That point would, no doubt, be far more ably represented by other witnesses. I do not, therefore, think it becoming in me to trouble you with any further remarks on that head.

8911. You spoke of inspection; with regard to the frequency of inspection in the wards of hospitals, what should you say are the objects of it?—My experience is, that they did not take place more frequently than once in a month. I naturally witnessed many such inspections, and they were generally performed with great speed and haste. I should rather say, that the chief points that were brought to the attention of the officers who inspected were matters of ordinary routine, such as the cleanliness of the boards, the cleanliness of the eating utensils, and other utensils, the general appearance of order, the arrangement of the beds, &c. But it struck me that those inspections were not so strictly professional as they might be, that is to say, that although those above mentioned conditions were very necessary subjects of inspection and were examined into, they constituted the whole of the inspection, and were made to supersede the necessity for examining into the condition of the men, how long they had been there in their beds, why they were still kept in hospital, what treatment they received, and other matters of great consequence to the service, as well as to the economy of the hospital.

8912. You think that it was an inspection of the furniture and state of the ward rather than into the state of the patient?—Yes; my experience only gives one instance of one inspection being made, by Dr. Linton, into the state of the patients.

8913. If you were right in what you said before, then the inspecting officer cannot know as much about the sick as the man in the habitual treatment of them; do you think that that arrangement is a good one?—Except so far as this:—If a medical officer felt that his duties were estimated according to their worth, that is, if he did well it would be recorded to his advantage, and if he was slovenly it would be recorded to his disadvantage, I hold that you would apply, in the most efficient form, a stimulus to active exertion, and a due animadversion upon neglect.

8914. (*Mr. J. R. Martin.*) Such results do not flow from the present course of inspection, according to your view?—No; my experience would be decidedly contrary.

8915. (*Dr. A. Smith.*) You say that the inspections were about every month?—Yes.

8916. By whom?—Sometimes by the deputy inspector-general, and at other times by the inspector-general.

8917. You state that, so far as you know, such and such points were inquired into, but others were not?—They were not.

8918. In a former answer, you stated that I sent out an authority for them not to interfere with your cases, or the cases of the civil surgeons; that being the case, can you speak fairly as to what was the nature of the inspections with reference to cases where no such restriction existed?—Yes, because I frequently accompanied them to see how the inspections were done, and to learn something of the management of the hospital.

8919. You frequently accompanied the inspecting officer into the wards of others?—Yes, and also the executive officer.

8920. But do not you know that a kind of feeling exists that the officer of one division will not accompany the inspecting officer into another division, lest he should have some fault to find with the officer of that division?—It was obviously with the consent of the medical officer.

8921. The medical officer in charge of the sick in the division?—Of both.

8922. (*Mr. J. R. Martin.*) Would it not be an advantage that such a course of inspection should be as public as possible, and open to all medical officers?—Yes, I think so.

8923. (*President.*) Have you any remark to make on the mode in which the inspections are conducted, as to the tone in which the junior officers are addressed?—I think it is of the highest consequence for effective treatment of the sick that the sick themselves should place full confidence in the treating medical officer; and I frequently had occasion to notice, and to regret, the sharpness of tone with which remarks were made on questions which might fairly have been left to the judgment, from their previous knowledge of the cases, of the executive medical officers.

8924. Was that done in the presence of the patient?—Yes, of course; it was done in the presence of all the patients.

8925. (*Mr. A. S. Stafford.*) Do you think that the number of medical officers, on the whole, was sufficient?—I think quite sufficient. After the civilians had reached them they made a considerable addition of something like 18 or 20 acting surgeons of independent authority. I think, if the executive officers had received the large accession resulting from the 1st class staff surgeons undertaking professional duties; and if the junior officers had been given more power, so as to be more efficient, then there would have been an ample supply of army medical officers, and especially if the reports and returns had been delegated to proper officers.

8926. What is your opinion of the conduct of soldiers in hospital as to their patience and endurance?—I think that they were extremely patient, and their endurance was testified on all hands. I believe that latterly there was a great deal of malingering—in my time.

8927. (*President.*) Up to what date were you there?—The 1st of February 1856.

8928. (*Mr. J. R. Martin.*) Do you imagine that a strong tendency to malingering was produced by their privations?—By the reaction which followed the publication of their privations in England, men were becoming spoiled. I should say that the great business and duty of a hospital is, to take the men in and cure them as quickly as possible, and send them off to duty as quickly as possible; but if all kinds of appliances and indulgences are sent out for the amusement of the sick—chessboards, draughtmen, and such things, those men, especially cunning men, as many were, felt it too pleasant a place to abandon for the front, so long as they were allowed by a young medical officer, who hardly possessed sufficient power over them, to remain in hospital. Of that I can mention one particular instance. When the hospital at Kulali was broken up I received into my wards in one night 47 men, and it occupied me till about one in the morning to get them all into their beds, and properly attended to, and their diseases diagnosed; but I came to the conclusion, from a vast number of those cases, that they ought to be at the front, and the next morning I sent off many of them. One man in particular struck me as being a fine, tall, able-bodied serjeant, six feet two inches high, with obviously nothing the matter with him. This man had been drawing extras, half a fowl daily, eggs, and brandy, and had received a good deal of indulgence from the lady nurses at Kulali, but he was obviously being pampered and spoiled. I sent him off to duty. By a most excellent arrangement at that station no man was allowed to go back to another ward than the ward of the officer who had discharged the man. That man never came back, and of 24 other men discharged within a few days after none came back; they all went to their duty, and they were found fit for duty—

and most of them had been four months in hospital—there were none less than two months.

8929. You think that they went back to duty reluctantly?—They found that they had no chance where they were. Their cases were palpable cases of malingering, and when men are once detected at it they are very glad to get off to duty.

8930. But a long siege generally produces such results?—Yes, with other causes spoiling the men.

8931. (*President.*) This happened after the period of privation and hardship?—Yes.

8932. It was when the siege was over?—Yes, Sebastopol had fallen. This was in November, but we had still a larger army at the front, and it was fully expected that we should require every man that could be spared for the spring operations.

8933. (*Mr. A. S. Stafford.*) If the state of things which you have described was in some degree the effect of the system that does not throw blame on the medical officers who were in charge of those men?—No; certainly not.

8934. (*President.*) You stated that they were allowed indulgences, having deceived the younger officers who had not power enough over them?—Yes.

8935. Those are the officers over whom you wished to withdraw the power of inspection?—I do not propose to withdraw from them the power of inspection, but simply the supervision and control of the 1st class staff surgeons; leaving them still under the absolute control of the principal medical officer. They were generally acting assistant-surgeons and dressers, and were a very different sort of men from such as would pass a competitive examination in London. Very different from such men as those from whom promotion would take place, who must be at the least of two years' standing.

8936. (*Mr. J. R. Martin.*) Of an inferior class to those whom you would propose to send into the army?—Yes.

8937. (*President.*) Have you any cognizance of the methods in which confidential reports were made?—Yes, I think generally speaking the system was not understood; men, without being quite sure of their ground, were exceedingly unwilling to step at all out of the way of routine, so as to attract notice. I have often heard it said by men in the army that the best way to get on was to keep perfectly quiet, and never let your name be heard; but if you stir either one way or the other, either under a sense of duty or a love of meddling, the result will be the same.

8938. (*Mr. J. R. Martin.*) A state of listless quiescence?—Yes.

8939. (*President.*) Your opinion is only one gathered from the conversation of other persons?—I am obliged to shape my answer as distinctly as I can; but I should be sorry that it should appear as more than my own individual opinion.

8940. Supposing that war was to break out again, and that the number of officers commissioned in the army medical department were insufficient, would you recommend again the employment of civil surgeons?—Yes; but I would not recommend a civil hospital as distinct from a military hospital.

8941. Like the hospital at Smyrna?—I think that that is open to objection.

8942. Why?—Separate establishments, rival establishments, competing one with the other, lead to enormous increase of expense, and, among other things, the result is, I think, to spoil the men.

8943. How do you mean to spoil the men—do they get differently treated in different hospitals?—Yes, I think with one system of military hospitals, subject to some changes which are on the point of being carried into effect, that the way of meeting emergencies in the case of war bursting out with an insufficient number, would be by introducing the extraneous aid of the civil surgeons to do duty, either in those military hospitals or to go anywhere where their services may be needed, at the front, or elsewhere.

8944. (*Mr. J. R. Martin.*) But under strictly military rule?—Yes, that they should hold, in fact, the local

Henry Mortimer Rowdon, Esq.

13 July 1857.

Henry Mortimer
Rowdon, Esq.

13 July 1857.

rank of executive officers, subject in every way to the same degree and form of medical supervision.

8945. (*President.*) Do you think that civilians will attend to the rules of the military medical service, and submit to its discipline willingly?—Certainly.

8946. Taking your own case, an exception was made for you, you were not placed under the same discipline as an army medical officer of the same rank?—I was entirely subject to the supervision and control of the principal medical officer.

8947. Of him only; whereas an army surgeon would have been subject to the control of the principal medical officer, and would have been subject to the control of an intermediate inspecting officer?—Yes, which I hold to be a great evil.

8948. Would he submit to that willingly?—Yes.

8949. Would you have submitted willingly to be under an intermediate inspectorial officer?—No, I should not have done so, because I considered my standing in my profession justified me in expecting better things.

8950. Would you exclude from among the civil surgeons men of the same standing as yourself?—No, I would rather recommend in the event of a war the employment of civil surgeons to do duty in the military hospitals, and that they should be subject to the same control as that which I have recommended for all the executive army surgeons, namely, that of the principal medical officer.

8951. If the present system were not changed you think that there should be exceptional treatment for civilians?—Yes, I think so.

8952. (*Dr. A. Smith.*) Are you correct in stating that you were only under the superintendence of the principal medical officer; I think, if I recollect rightly, you were under the superintendence of the principal medical officer and of the deputy-inspector of the division?—No, I have a copy of your former letter in March and I have a copy of another which you wrote to inspector-general Dr. Cumming, repeating, as late as the 12th of September, the fact that in consequence of the position which those civil surgeons held in their profession and their standing in it, it was not possible for you to make other arrangements than that they should be subject solely to the supervision of the principal medical officer of the station.

8953. How was it, then, that when the disagreement took place between Dr. Macgregor, in the hospital in which you were serving, and yourself, you did not at once raise the question and say that you had nothing to do with him?—I did.

The witness withdrew.

T. Alexander,
Esq., C.B.

THOMAS ALEXANDER, Esq., C.B., examined.

8960. (*President.*) You have given a good deal of attention to the subject of the division of the different ranks of the medical department into executive and administrative?—Yes.

8961. What alterations would you recommend in the existing system?—I think the rank of first-class staff surgeons and senior surgeons of artillery might be done away with. I would have only two inspectorial ranks, viz., deputy-inspector and inspector-general; the ranks would then be, staff and regimental assistant-surgeons, staff and regimental surgeons (and all surgeons, after 20 years' service, should have the rank of surgeon-major), deputy inspector-general, inspector-general, director-general.

8962. You would propose two administrative, and two executive ranks?—Yes; only two administrative, and all others executive.

8963. You would not confine the director-general to the surgeon-majors, in making his selection for the administrative ranks?—No; this change would open the field of selection to the director-general, over all the surgeons, instead of at present only over a small number of first-class staff surgeons.

8954. But you recollect that you continued the alteration that took place between you and him, and you spoke of your reasons for doing this, as if you were recognizing his authority to question you, though you say no other person had authority to question you, except the principal medical officer?—The only point was this,—he wished to know the number of men who were obliged to keep their bed in that ward, and by an act of his own a case of typhus fever was put into the one only empty bed in that ward a few hours before without my knowledge. When I went in and found this man in this dreadful state, surrounded by men with wounds and bruises, I felt it necessary to put half the men out into the corridor at once. The next morning when the deputy inspector-general came to know the number of men who were required to keep their beds, I had no objection to give him the information, but I told him that as half the men were in the corridor, I could not tell him then, but would give him information within half an hour, which was done.

8955. (*Mr. J. R. Martin.*) On the whole, it would appear to be your impression that the hospital regulations as now enforced operate practically to discourage medical officers from reporting the deficiencies in their hospitals?—Yes, I have no doubt in my own mind about it.

8956. Therefore it appears to you that the effect of that course of inspectorial service is to diminish the amount of strictly professional knowledge possessed by that class of officers?—Yes. Professional matters were not likely to be inquired into; of course the executive officers, hearing that their wards were to be inspected, naturally directed their attention to the state of those things which they knew would be inquired into.

8957. (*Dr. A. Smith.*) On the occasions when those inspectorial officers were going round the wards, did you not frequently see that they would go and take the ticket from the bed head of a patient, look at it, and ask the officer under whose treatment the patient was, the circumstances of his case?—I never saw that done but once. Although I attended many other inspections, I never saw it done but in the single instance that I have above referred to.

8958. With respect to inspections, you limit your experience to the hospital at Scutari during a time of pressure?—No; not entirely to a time of pressure, for only occasional pressure existed there after June 1855.

8959. But during the time of war?—Yes.

8964. Would you make the relative rank carry any practical advantages with it, beyond what it does now?—I think the relative rank ought to carry all the advantages, as to pay and allowances, honorary distinctions, funeral honours, choice of quarters, &c.; and, when medical officers are members on boards regarding sites for barracks, hospitals, positions of camps, or anything connected with the sanitary arrangements of the troops, they should sit and sign, according to their rank, and dates of their commissions, but on no account ought a medical officer ever to assume any command. Staff and regimental assistant-surgeons on appointment should have the relative rank of lieutenant, according to the date of their commissions, and after 5 or 6 years' service the rank of captain with the attendant allowances, choice of quarters, &c. As an assistant-surgeon enters the service 5 or 6 years older than the military officer, when he has served 5 or 6 years he would then be equal in standing as regards age to the military officer of 10 or 12 years' service. Staff and regimental surgeons should have the relative rank of major on appointment, and after 20 years' full-pay service be styled surgeon-major,

with the relative rank of lieutenant-colonel. The surgeon, being in medical charge of a battalion, holds a most responsible position, certainly much more so than that of a captain commanding a company; higher relative rank would only give him the advantage of better quarters and other allowances, but he should never make choice before the commanding officer.

8965. Might it not happen that a surgeon-major would have the relative rank of lieutenant-colonel of prior date to that of the lieutenant-colonel commanding the regiment?—No medical officer ever takes rank above his commanding officer. In quarters wherever they are, it is always put up, "Commanding officers' quarters;" the best quarters are always told off for the commanding officer.

8966. (*Mr. J. R. Martin.*) You do not design that the medical officer should have a preference over the commanding officer?—Never.

8967. (*President.*) Would you allow him, in case the lieutenant-colonel of the regiment was junior, to rank before him?—No, certainly not. He must always be under him. The relative rank would only give him a prior choice of quarters over the other officers, extra fuel, and light, &c.

8968. (*Dr. A. Smith.*) Would it not create this difficulty:—Supposing the whole of the officers of the regiment were invited to the table of a general officer, the question would arise, who was to take out the wife of the general officer?—It might be arranged in such a way that the medical officer of equal relative rank, was invariably to rank after the commanding officer of his regiment; were the relative rank of major bestowed upon him, it would raise him in the estimation of his brother officers, and his opinion would, no doubt, with regard to sanitary and other matters, have greater weight with the commanding officer. The deputy inspector-general, on appointment, should have the relative rank of lieutenant-colonel, and after 3 years' service in that rank he should rank as colonel, as is now granted to military officers by a late warrant. As the deputy would generally speaking be the inspecting and highest medical officer on the station (with few exceptions), I am of opinion that the relative ranks now mentioned would not be considered too high. Inspector-general should rank as brigadier-general on appointment, and after 3 years' full-pay service in that rank he should have the relative rank of major-general. However, when in the field as principal medical officer of an army, he ought at once to have the rank of major-general.

8969. (*President.*) What would you propose as to promotion, which by seniority and which by selection?—All the executive ranks, in my opinion, should go by seniority; a standard being laid down, and admission into the service being by competitive examination, no medical officer ought to be allowed to hold the commission of assistant surgeon who is not fitted to be surgeon. The administrative ranks should be by selection, for merit, zeal, efficiency, duties or services performed, and also for administrative talent.

8970. Do you mean seniority in the whole army list, or within a certain group of stations?—I should much prefer the whole army list. There are such rapid communications now by steam, that I think it would be better than by stations.

8971. Or if you could divide the whole globe into two stations for promotion?—Yes, you might; but the same should be clearly laid down.

8972. Supposing the other was found too expensive?—Yes; you might carry out the recommendation of the director-general, viz., if an officer on one of the stations was passed over by a junior, by antedating the commission of the man who was passed over, the first opportunity. In the case of selection for the administrative ranks, were two candidates equal, the preference ought to be invariably given to the senior.

8973. When promotions are made by selection to the administrative ranks, would you recommend that to be done under any restrictions or regulations?—I think the director-general, on recommending these

promotions, should give his reasons in writing to the Commander-in-Chief; and if the latter deemed them sufficient, the promotions should take place.

8974. The Commander-in-Chief being the authority to give the promotion?—Yes; but the director-general ought to recommend; and, in the event of any future reference, the reasons assigned by the director-general for the recommendation might be noted in a book to be kept for future reference at the board.

8975. Do you propose any scale of retirement different from that which exists at present?—I think it would be looked upon as a great boon, if officers were allowed to retire after 20 years' service; they seem very desirous to have it; not that I think many of them would embrace it. Every officer ought also to have an unqualified right to retire after 25 years' service, as at present; and retirement ought to be compulsory at 30 years' service for executive officers, and at 35 years' service for administrative officers. If an officer were placed on half-pay by reduction or from ill health, I would recommend the same rate as the director-general, viz., 3-4ths of the amount that he is receiving at the time; but if he retired at his own request it should be only 5-10ths at 20 years' service, and 7-10ths at 25 years'. By doing away with the first-class staff surgeons you would require six or eight more deputies and two inspector generals; of the two latter, one as inspector-general for Great Britain, the other for Netley. (*See Appendix No. X., 2.*)

8976. Would you propose to give to any of the old officers full-pay retirement?—Yes, good service pension to a certain number. Full-pay retirement for a certain number of executive officers.

8977. (*Mr. J. R. Martin.*) And a step in brevet rank?—Yes, you might, but the pay of all ranks ought to be increased and commence at once, instead of serving two years on the minimum, as at present, the same charge allowances as at present for the principal medical officers at stations and in the field. Brevet rank should also be granted and carry 2s. pay per day with the attendant allowances of the rank; it might be given for special services in the field or otherwise, and the reasons might be given for promoting such officers; such would be attended with great advantages, as it would hold out a stimulus for exertion, and you need not remove the medical officer from his position, which might be one of great usefulness. The assistant-surgeon, when in charge of a battalion, ought to have some extra allowance, the same as is given to other military officers. More leave ought also to be granted, and a fair proportion of leave should be given to sick medical officers for the recovery of their health. A roster for all ranks should be kept and strictly adhered to. Certain fixed periods for service on the staff abroad, say for unhealthy stations three years, for healthy stations, five years. Regimental medical officers would take their chance with their regiments. No officer on leave ought to pay for the performance of his duties.

8978. (*President.*) Would you make any alterations with regard to forage?—Forage ought to be given to all surgeons without paying for the same. Servants and rations for the same ought to be given according to rank, if the former be not granted from the hospital staff corps, a certain allowance should be given with rations for each servant the officer is entitled to, provided he is kept. At present, whatever be a medical officer's rank, he only draws money allowance for one. Were a certain number of the most meritorious officers of the department styled honorary surgeons and honorary physicians to Her Majesty, the same would be looked upon as a boon.

8979. Would you make any alteration in the mode of conducting confidential reports?—I think it would be very desirable that they should be placed on the same footing as the military confidential reports. If any report is made against an officer, the specific cause of complaint should at once be made known to him, so that he might have an opportunity of clearing himself; if delayed, the opportunity may be lost. All the rules and regulations regarding promotions,

*T. Alexander,
Esq., C.B.*

13 July 1857.

reductions, retirements, leave, roster, and periods of service on stations should be clearly laid down and published, so that candidates might know what inducements were held out for them to enter Her Majesty's service, and such would give great satisfaction to the department.

8980. Would you extend that remark to other matters, to the regulations for hospital duties?—There ought also to be drawn up and published a new code of regulations, clearly and distinctly laying down the duties of the different ranks, the returns and reports called for; when they were due; the requisitions that ought to be made, how they were to be made, and upon whom; also a revised nosological table, so adapted that the Registrar-General could include the mortality of the army from the different diseases in his returns.

8981. Would not that be a very great advantage to the army if the amount of sickness and mortality were kept constantly before the public, so that they might take measures to improve the condition of the soldier?—Yes; it would bring prominently before them many facts which are too little attended to at present.

8982. That would act, would it not, as a spur to the authorities, and to the House of Commons?—Yes, by bringing before them prominently the data that would be observed.

8983. A good many of the existing regulations have now become obsolete, have they not?—Several of them.

8984. For example, it was stated by a witness that the duties laid down for an assistant surgeon are the duties of very little more than a dresser?—By the regulations the medical officer is desired "In order to insure the most effective aid to the surgeon, he should allot to the assistant surgeon specific duties."

8985. Is there not also a statement of the duties of the assistant surgeon himself?—Yes. "Making health inspections weekly, bandaging and dressing sores and ulcers, filling up the diet tables, preparing the medicines prescribed for the patients, and seeing the same invariably administered twice a day."

8986. Do those regulations require revision?—I think it would be advantageous if this book were brought up to the present day, and a copy of every return called for inserted in it, the duties distinctly laid down of all ranks, also a revised nosological table.

8987. Have you any suggestion to make as to the constitution of the medical board?—I think there ought to be a director-general, an inspector-general of hospitals, and two others. The director-general should be supreme. A board always delays and neutralizes responsibility, and can never act so energetically and decidedly as when the responsibility is lodged in one individual.

8988. (*Mr. J. R. Martin.*) The board would be a scientific board?—It would not be a board at all. The director-general would be supreme, but the inspector-general ought to have a separate office at the board. His duties would be principally those of inspecting officer in Great Britain, of all the various hospitals, barracks, and camps, in addition to examining into the treatment of the sick, and the state of the hospitals; he would also combine the duties of sanitary officer, and at his periodical inspections inquire and examine into all the sanitary arrangements of the different hospitals, and barracks, viz.: ventilation, accommodation, cubic space allowed for each man, drainage, sewerage, dieting, and clothing, pointing out to the various medical officers what measures he deemed necessary on those points, and holding them responsible for carrying out all sanitary measures connected with their battalions. This officer ought also to be invariably consulted on sites for hospitals, barracks, and camps, their ventilation, construction, and other sanitary arrangements of the army. He ought also to have it in his power to communicate directly on all such matters with the Minister-of-State for War, and furnish to him a report of

his inspection tour, with whatever suggestions and improvements he deemed necessary. A copy of the same report ought to be sent to the director-general.

8989. (*Dr. A. Smith.*) Do you mean that a report ought to be sent by this inspector-general, who is to be in the director-general's office, direct to the Secretary-at-War, instead of making the director-general the medium of communication and responsible for that report?—I think that this officer should be so far independent of the director-general, though subordinate to him, having the certain duties above-described particularly set apart for him; all correspondence on these matters should come to his office. It would relieve the director-general of a great deal of his present labours.

8990. (*President.*) Ought not the report which he makes to the Horse Guards to go through the director-general?—Yes, it might. I see no objection to that.

8991. (*Mr. J. R. Martin.*) The functions being correspondent and co-ordinate?—Yes, quite so, though under the director-general; nothing need go through his office without the director-general knowing it.

8992. (*Dr. A. Smith.*) Do not you conceive that the sanitary officer ought to be liable to be ordered to any place if the director-general received information from the surgeon of a regiment that any particular sickness prevailed?—Quite so; such would be one of his specific duties, to visit at once any regiment when sickness prevailed.

8993. Then he must be a subordinate officer to the director-general?—He should be so far under him, yet have a separate office and specific duties; I do not think that he ought to be removable at the will of the director-general. The director-general would have his own personal staff, but I think that an officer of this kind should be so far independent, though under the director-general.

8994. (*Mr. J. R. Martin.*) He should be nominated by the Minister for War?—Yes.

8995. (*Dr. A. Smith.*) Is it the practice in any office for the Minister for War to nominate any other officer to work with the head of another department without the concurrence of the head of that office?—You have the quartermaster-general and the adjutant-general so far distinct, and they are under the Commander-in-Chief.

8996. But they do nothing except with the concurrence of the Commander-in-Chief?—Nor need this officer do so, without communicating it to the director-general.

8997. (*Mr. J. R. Martin.*) In that case his independence is a necessity of his position?—Yes. Had such an officer been at hand during the Crimean war, it would and ought to have been his duty to have proceeded thither, and seen what was necessary as regarded sanitary measures; and having full powers in these matters, the same could have at once been carried out. All inspecting medical officers on stations ought at their inspections to point out to the various medical officers under them, what sanitary measures they deem necessary to be carried out, and desire them to attend to the same. Such, in my opinion, is the only true and practical working of sanitary measures in the army. There are at present in the army medical officers as well versed in sanitary matters as any in civil life, only, powers must be granted to them to have their recommendations on those matters carried out. There ought also to be another officer for statistics; a thoroughly practical man appointed expressly for receiving and examining into all reports from the different medical officers from all parts of the world, for culling out facts, data, statistics, and cases worthy of publication. Were such statistical returns, facts, and interesting cases published (with the names of the officers attached who had drawn them up), not only would a stimulus be held out to officers to exert themselves, but a mass of facts and data of much importance would be soon obtained, which might be of immense importance at some future period. These reports could be published annually at the expense of the government. There

ought to be, in addition to these two officers, a deputy-inspector as professional assistant to the director-general.

8998. (*President.*) You would make it a statistical department for the army within the medical board?—Yes; one officer expressly set apart for statistics would in my opinion be sufficient for these duties, a board for statistics not being required; but I would combine the sanitary officer and the inspecting officer, I think they would work better in one individual than separated.

8999. (*Dr. A. Smith.*) Do you see any objection to the sanitary officer being the president of the statistical board?—He would not have time, besides it would be better were the two duties separated.

9000. (*President.*) The statistical officer ought to be a man at his desk working figures, and the sanitary officer ought to be a man continually going about and inspecting?—Yes, such is my opinion.

9001. (*Dr. A. Smith.*) If there was a statistical board and a sanitary officer, he might be the inspector-general and president of that board; there are certain times when he must make his inspections of different barracks and hospitals. We cannot contemplate, with the small force that we have in this country, that as a sanitary officer he would be employed more than one half of the year; a case might arise in which it was necessary to send a sanitary officer to Colchester to ascertain what was deficient there, he would then immediately return to his duties in London, and he would have nothing to do unless he was president of this statistical board, to which he might at least give seven months of his attention; the other members of the board, if constituted of three, would work up all the points; what would there be objectionable to that?—This inspecting and sanitary officer might be called away on duty at any minute, and I consider that only one officer is required for statistics, not a board.

9002. (*President.*) Do not you think that, generally speaking, the same man who would have a talent for statistical inquiries would not be likely to have also the peculiar qualifications necessary for sanitary matters?—I think that they are two distinct duties, one may be a good pen-and-ink man and the other might not like it at all, in fact they are quite different.

9003. (*Mr. J. R. Martin.*) The other would be the medical topographer of the army?—Yes.

9004. Do you contemplate that he should also receive topographical reports and sanitary reports from various foreign possessions?—Yes.

9005. Sanitary reports and topographical reports?—Yes.

9006. (*Dr. Sutherland.*) From your experience in the Crimea you know the state of things which existed from troops arriving, from troops shifting ground, and fresh camps being occupied; would it be advantageous to the service, supposing a similar event to happen again, that there should be a sanitary officer attached to head quarters to look to that work from day to day?—Yes, such an officer would be decidedly necessary, and his duties would be most important.

9007. (*Sir J. Clark.*) To whom would you attach this general officer of health? to the chief medical officer?—He would be attached to the quartermaster-general's staff; but to make it work well, he ought to be subordinate to the principal medical officer, yet so far independent as to correspond directly with the Commander of the Forces, and Secretary-of-State for war, giving copies of the same to the principal medical officer for his information.

9008. (*Dr. Sutherland.*) Who would decide, supposing the sanitary officer was of one opinion and the principal medical officer was of another opinion?—The general officer commanding.

9009. (*President.*) Would not the general officer commanding-in-chief follow the opinion of the man who he thought was the better qualified to give an opinion?—Certainly, he would follow the opinion he considered best.

9010. (*Mr. J. R. Martin.*) The sanitary officer having a special function?—Yes. If the sanitary officer reported so and so, and the principal medical officer forwarded his opinions on that report to the commander of the forces, the latter would decide and order so and so to be carried out.

9011. Does not it accord with your experience that there is much good will and disposition to forward the general purposes of the army among all classes of officers, and that clashing is very rare?—Yes; the object with all is, or ought to be, to work for the good of the service.

9012. (*Dr. A. Smith.*) Is that practically the case?—I think so, only you will find that military officers do not always hold the same views with regard to sanitary or other matters as medical officers do.

9013. (*President.*) Do you contemplate making the staff of the department of the director-general removable after an interval of so many years?—I think it would be but fair that they should take their fair turn of foreign service; they might hold it for five years or so.

9014. You are aware that by regulation the quartermaster-general and the adjutant-general serve only for five years?—Yes, both at home and abroad now; they are removed every five years.

9015. Would you extend that? would you say that of all medical appointments, and that the director-general should only serve for a limited period?—No. I think that the director-general should remain for a longer period; but all other appointments should be for five years only.

9016. (*Dr. A. Smith.*) With reference to removing the staff of the director-general after a given time, do you think that, though that might be very agreeable and perhaps just to the officers of the department, it would not be highly detrimental to the service?—No. I am of opinion that in a couple of months, or less, any man could make himself conversant with the duties of any office.

9017. (*President.*) Do you not think that in other offices the introduction of new blood is very useful?—Yes, always, and I think it would be very advantageous for the medical department.

9018. Do not the same men get wedded to the same systems if they serve too long?—Yes, quite so; and if rules and regulations were published, as I have already suggested, and which are really necessary, it would be all plain sailing, and very satisfactory to the department.

9019. (*Mr. J. R. Martin.*) Every officer would be well informed as to what he might expect in the service?—Yes; I think if you published the regulations, clearly defining the duties, &c., required, you would not have one letter for 50 that you now receive.

9020. (*President.*) Do not you believe that every change almost, whether it is the Commander-in-Chief, the adjutant-general, or the quartermaster-general, has generally produced some improvement?—Yes, you get into an old routine system, and any change must be far preferable to such a state of things.

9021. (*Mr. J. R. Martin.*) But the change after five years you would not make imperative; you would allow the government to continue an officer for five years more?—Yes, he might be reappointed under particular circumstances; still, as a rule, I would hold to five years tenure of office.

9022. (*President.*) With power to re-appoint?—Yes, they can re-appoint if they choose, as at present in the military staff appointments.

9023. (*Dr. A. Smith.*) In one of your answers, with reference to the different ranks of the department, you mentioned that for getting rid of staff surgeons of the first class, it would probably be necessary to increase the number of deputy inspectors by six. As matters now exist, there are at all events Hong Kong, New South Wales, Bermuda, the Channel Islands, Portsmouth, Plymouth, Mauritius, the Ionian Islands, Malta, and Jamaica. Those are stations where deputy-inspectors are not quartered, but where

*T. Alexander,
Esq., C.B.*

13 July 1857.

T. Alexander,
Esq., C.B.
13 July 1857.

staff surgeons of the first class are stationed, as it is necessary to have officers of a certain standing to consult and advise the general officer commanding. It would be necessary to add to the deputy-inspectors at least six or eight?—I have counted them all up, and, excluding Bermuda, I do not think you require more than six or eight to embrace every station you have mentioned. If it is necessary for a small station like Bermuda, I do not see why a surgeon-major could not act, under peculiar circumstances, as an administrative officer. There are at present deputy-inspectors at Portsmouth, Corfu, and Jamaica.

9024. Are you aware, that such have been the necessities during the war on some stations, that we employed the surgeon of the regiment, whose length of time there had been so short when he was moved away and another came, that neither in this country nor in the command itself could matters be kept square. Bermuda was one?—Why not keep a sur-

geon-major at Bermuda or other small stations, and you remedy the evil.

9025. Then he becomes an administrative officer?—I would only make them so under peculiar circumstances. Occasionally a captain commands a regiment.

9026. You would get rid of 22 staff surgeons of the first class, and for them you would get six deputy-inspectors?—Yes, I think that there should be only two administrative ranks, Deputy-inspector and Inspector-General, unless, as I have stated, under peculiar circumstances.

9027. (*President.*) You think that a regimental surgeon is far more important to the public service than a first-class staff surgeon?—Yes, I do not see why a surgeon-major should not be sent to a recruiting district; have charge of dépôt battalions, and perform all the executive duties the first-class staff-surgeon does now.

Adjourned.

Wednesday, 15th July 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

Dr. James
Brown
Gibson, C.B.

Dr. JAMES BROWN GIBSON, C.B., examined.

9028. (*President.*) What rank do you hold in the service?—Deputy-inspector of hospitals. I am now at Aldershott. I am the principal medical officer there.

9029. Where have you served?—My first service was at Chatham for about six weeks, in the latter part of December 1826 and the beginning of 1827; I then went to the West Indies; I landed at Barbados, and proceeded immediately to Demerara; there I spent eight years continuously, in charge of my regiment the greater part of the time, and sometimes of another regiment, and of the whole civil and military staff at George Town, British Guiana.

9030. After that what did you do?—I returned to England and arrived at Cork. I found the dépôt of my regiment at Cork Barracks without a medical officer, and I served with it for two months. I was then appointed to the 17th Lancers as assistant-surgeon, with which I continued to serve as assistant-surgeon until the second-class staff surgeons were made in 1841; then I became a second-class staff surgeon, and then I went to Malta.

9031. (*Sir T. Phillips.*) Were you in Ireland and England at any time?—Yes, and in Scotland.

9032. (*President.*) Then where did you go?—I went to Malta, and remained there two years, and was brought back again to the 17th Lancers as its surgeon.

9033. How long did you remain with them?—Till I landed at Kulalce on the 19th of May 1854, when the expeditionary army went to Turkey. The following day H.R.H. the Duke of Cambridge informed me he wished me to live with him and showed me the room and the stables he had kindly reserved for me. Two days afterwards, on the arrival of the assistant-surgeon, I joined His Royal Highness, and was immediately attached to the Highland brigade. With it and the Duke of Cambridge, who commanded the first division, I proceeded to Bulgaria, and from thence to the Crimea.

9034. Till the Duke of Cambridge left, and then you went to Malta?—I accompanied His Royal Highness on the several stages of his journey back to England.

9035. (*Mr. T. Alexander.*) How long were you in England?—From 1st February to 19th May 1855.

9036. How long did you remain at Malta?—From the first of June 1855 to the 26th of May 1856. I arrived in England on the 2nd of June.

9037. (*President.*) When were you appointed to Aldershott?—Immediately after my return; I proceeded there on the following Monday.

9038. You had rather more than a year at Malta? Yes; I should say that on my return, some time after, to England, when the Duke of Cambridge's health was sufficiently recovered, I expressed to Dr. Smith my readiness to return again for service in the field; I will also say that I would not have returned; I doubt that I should even with the Duke of Cambridge if it had not been for other circumstances in connection with promotion.

9039. What number of staff officers are there under you at Aldershott?—One first-class staff surgeon and an assistant staff surgeon as at present; I have had two first-class staff surgeons.

9040. The regiments at home have now two assistant surgeons each?—Yes.

9041. Is the work better done in consequence of there being two?—Yes, unquestionably. The general duties of the regiment must be done with greater facility and less liability to interruption from sickness and pressure in the hospital. I think that the majority of the medical officers do their work well. When the regiment had only one assistant-surgeon, I think the duty in the hospital was as well done as at present.

9042. Is there enough work in the regiment to keep in full employment three officers, a surgeon and two assistants at home?—I think it would be advantageous to the service that it should be so; a medical officer may be sick and require leave of absence. At Aldershott

there is an orderly medical officer of each hospital, and three medical officers on duty every day as orderly medical officers, three assistant-surgeons. We have four hospital divisions, three in the south camp and one in the north camp, and in each of those hospitals there is an orderly medical officer, on for 24 hours, taking it by rotation from the different regiments.

9043. (*Sir T. Phillips.*) Would two officers constantly present be adequate to discharge the duties of the regiment?—If they were always with it and never sick—there are a great many duties to be done besides those of the hospital. At Aldersholt one assistant-surgeon is necessarily detailed to attend each brigade on general and brigade field days, at rifle practice and certain regimental parades.

9044. (*President.*) There is no general hospital at Aldersholt?—No.

9045. Have you a system like that which exists at Dublin and Portsmouth, a number of regimental hospitals being put together?—Yes; they are a congregation of regimental hospitals, partly on the regimental system, and partly on the general system—all on one system. There is one in each division cooking, which is very advantageous, I think.

9046. That is general?—There were three regiments usually—the 88th, the 2nd battalion of rifles, and part of the 82nd, in the new hospital huts; there is only now one regiment, but the sick of one regiment; there is usually the sick of three regiments in the old union workhouse; there are the sick of these regiments in block 3, in the south camp, and there are the sick of eight regiments in the camp. In each of those divisions there is one common kitchen.

9047. (*President.*) That is like a general hospital?—Yes, because the purveyor sees to the cooking for all the sick in each division.

9048. In what respect is the system regimental?—In every other respect with the exception of there being general pack-stores.

9049. Do you think it is a good system?—I think it is a very good system.

9050. Do you like it better than a general hospital?—Infinitely.

9051. Why?—Because the regimental system is very good.

9052. So is the general hospital for its purposes?—Yes, but in Aldersholt such is the state of things, that the medical officers are acquainted, both with the duties of a regimental hospital, and they become acquainted with the main workings of a general hospital.

9053. How do they become acquainted with the main workings of a general hospital, if there is none there except as to cooking?—There is one general pack store.

9054. So far as the treatment of the sick is concerned, each man is confined to those of his own regiment?—Yes.

9055. (*Mr. A. S. Stafford.*) Is that as a preparation for war, when there must be general hospitals, does it teach the army medical department anything—you said that there were some particulars in which it was a regimental hospital, and some in which it was a general hospital?—Yes; and a very good one. In a general hospital the sick of a number of corps are placed in a series of wards without any distinction, and are attended by medical staff officers instead of regimental medical officers, and they are cooked for in one common kitchen; but they do not apply to the barrack-master for the hospital accommodation; they do not take it from him when they come into quarters, and they do not give it over to him when they leave. In strictly regimental hospitals they have a pack-store of their own.

9056. Have you served in any general hospital of late years?—No.

9057. Not since you were at Chatham?—I have been in Dublin, where there was a general hospital.

9058. That is a rule of yours, is it not, at Aldersholt, an agglomeration of military hospitals?—Yes;

I prefer them much to a purely general hospital but the present assemblage of them existed in Aldersholt on my taking the medical supervision of the camp; when I was second-class staff surgeon at Malta I had the charge of two regiments, the hospitals of which were conducted on the regimental principle.

9059. There is no general hospital there?—No, a regimental one. Formerly it was a complete regimental hospital. Now I think the cooking is done differently.

9060. (*Sir T. Phillips.*) What were your duties at Malta?—First I was placed in charge of the 19th regiment in consequence of the absence of the surgeon. I was then in charge of the reserve battalion of the 42nd highlanders, which came from England and the other battalion from Corfu. I subsequently had the general duties of the staff, but specially I was physician to general Sir Patrick Stewart and his family, and had the general staff duties.

9061. You became a regimental officer when you began there?—I did not. I was not gazetted to the 17th lancers till about three weeks before I left Malta.

9062. And continued so for some time?—Yes; I continued to do the duties of general surgeon till I left for England to join my regiment.

9063. What were those duties at Malta?—The commissariat, head quarters staff, and all the civil officers.

9064. (*President.*) At Aldersholt you have endeavoured to establish a field hospital for the instruction of junior medical officers?—Yes.

9065. What course have you taken for that purpose?—I have directed that all the trivial sick who did not require hospital diet, such as slight contusions, boils, and sprains, and trivial affections, should be treated in a hospital marquee; and I made arrangements with the assistant quarter-master general that a hospital marquee should be sent out with each corps—12 sets of bedding, viz. palliasses with straw, and a bolster with the necessary blankets and rugs a couple of camp kettles for cooking, and a kettle to boil hot water &c.

9066. In short everything complete?—Not complete, but such things as I conceived were necessary to carry out my objects.

9067. Complete for a temporary field hospital?—Yes.

9068. Did you have any difficulty in carrying that out?—Yes; considerable difficulty, and the matter has been referred to the authorities in London.

9069. You cannot carry out your experiment, as the barrack-master would not give you the necessary materials?—I have got the beds and bedding on the responsibility of the lieutenant general, and the barrack-master issued them.

9070. In spite of the refusal of the authorities in London?—No, the authorities in London have not refused them.

9071. They have disapproved of them, but they have not withdrawn them?—No, but a verbal communication has been made to me about them.

9072. What was the communication?—That the barrack master's instructions did not allow him to issue the other articles required.

9073. Will that put an end to your experiment?—No, not until I receive an order for the withdrawal of the things. Had I not been here to-day I should have written to Dr. Smith that he might endeavour to get the things, supposing they had his approval.

9074. What is the health of the troops at Aldersholt as compared with their ordinary health in barracks in England?—They enjoy a better state of health.

9075. Do you know what the per-centage is—what rate per annum?—Per diem from 4 to 4½ per cent., taking the whole sick.

9076. What would it be in barracks?—About 6 per cent.; a very small proportion of the per-centage at Aldersholt is real sick—the greater proportion is syphilitic disease.

Dr. James
Brown
Gibson, C.B.

15 July 185

Dr. James
Brown
Gibson, C.B.
15 July 1857.

9077. That would be so elsewhere?—Yes, but not to the same extent as almost every unfortunate woman about Aldershott is, I fear, diseased.

9078. What would it be if the troops were quartered in barracks in Dublin or Manchester usually?—It varies. I believe it runs from 6 to 10 per cent.

9079. (*Mr. T. Alexander.*) Do you not include all the troops that pass through instead of remaining there for six or twelve months?—With the exception of the regiments from the Crimea, no troops pass through Aldershott—they have all remained there for long periods, none for short periods.

9080. (*Sir T. Phillips.*) What is the shortest period?—Of the regiments that came there from the Crimea a number passed through the camp and remained but a very short time. All the winter troops remained there—they came from the Crimea. I think in February of this year the first move took place; in fact there is one regiment still there, and that came about last July.

9081. (*President.*) I see that the average of sick, in the foot guards is a little over 4 per cent. in London; that is about the same as your rate at Aldershott?—It is rather less, according to my morning state that I give to the general; it was less in the beginning, in consequence of the regiments passing through.

9082. (*Mr. T. Alexander.*) Do not many regiments proceed there, and remain perhaps for a month or six weeks, and then pass on?—Only the Crimean regiments; I send a daily state to the general; there have been few changes in the Aldershott camp since; I think that the last regiment that came was last August, since February there have been some changes; I mean to say, that throughout the whole number the daily average in my morning state has been 4 to 4½ per cent., excepting when the regiments were passing through, then it was as low as 2 per cent.

9083. (*President.*) Now it is about the same as the average in other places?—Yes, if 4 per cent is the average; but my impression was it was higher, because the engineer department provide hospital accommodation for 10 per cent.

9084. (*Sir T. Phillips.*) What is the health of the cavalry?—Very healthy.

9085. How is it with regard to the 15th hussars?—Like the other troops, during the Crimean war, they gave a great many volunteers, effective men; there was a large augmentation of the cavalry, and they had to recruit; and they had to make up their number by men that would not have been taken at other times. When the war ceased they could not stand the drill, and they went into hospitals in large numbers; the surgeon wished to get rid of them, and took them into hospital. Under other circumstances this regiment would not have had so many sick. It is now as healthy as the other troops.

9086. What became of those men?—They were discharged.

9087. (*President.*) You say that many of the cases are not cases of sickness, that is, not of epidemic disease, but that they are venereal cases?—Yes; we have had a singular absence of real disease.

9088. With regard to venereal complaints, are they worse at Aldershott than elsewhere?—No, about the average severity.

9089. Is it true that the diseases are fewer, though individual cases are more severe?—No, less severe.

9090. (*Mr. A. S. Stafford.*) Is there less fever?—Certainly less fever; there are from 25 to 30 cases during the whole month, out of an average of 11,000 to 12,000 men; the monthly number of fever cases has been from 25 to 30.

9091. (*Mr. J. R. Martin.*) What type of fever?—Most trivial. We have only had one death from typhus fever since September last.

9092. (*Mr. T. Alexander.*) Have you rheumatism or diarrhoea?—Very little, and there are scarcely any severe pulmonary affections. I made up a return for

General Knollys, embracing the six months preceding the 21st of May. I think there were only fourteen cases of inflammation of the lungs.

9093. (*President.*) Upon the whole, you would say that Aldershott was a very healthy station?—Extremely so.

9094. (*Mr. T. Alexander.*) It is quite a bog, is it not?—Quite the reverse. It is a very dry sandy soil, that is the secret of it; it is an extremely deep sand, covered with light surface earth, and when rain falls it disappears to a great depth. There is but little evaporation, and we have a dry atmosphere; and the men being very much in the open air, inhaling a great deal of pure air, there is a freedom from disease.

9095. (*President.*) If fever is so much below the average, what are the diseases that bring the sickness up to the average of the army?—Various forms of syphilis.

9096. If the fever is less, the amount of syphilis must be greater?—Yes, perhaps in quantity, but not in kind; the cases are not unusually severe.

9097. (*Sir T. Phillips.*) What has been the mortality?—It is various in different months. In December, with the exception of a man who died in the military prison, there was only one death; in March there was only one death among the soldiers; in April there was only one death, and in May, one.

9098. In January and February what was the number?—I cannot tell you that. I remember these as being striking cases.

9099. (*President.*) Can you ascertain the average for twelve months?—I can get it.

9100. (*Mr. A. S. Stafford.*) You have nothing to do with the guards' hospital?—Nothing whatever, except that I receive a daily state of sick.

9101. (*President.*) Do you believe that a hospital in a hut is better or more or less favourable to the health of the patient than a hospital in a masonry building?—In a well-constructed stone building, well ventilated, and containing everything that can be made for the sick, I should prefer it. At the same time, I must say that cases have done extremely well in the hut accommodation of Aldershott, and even severe cases of disease.

9102. It has not come under your experience that men recover more rapidly in huts, from their being better ventilated, and less impervious to the air?—That is the cause that I assign for the cases doing so well in the huts, and also for the high state of health of the men; the latter also to the sanitary condition of the camp being well looked after.

9103. Do you remember the case of the huts near Dublin, in which the men were treated for fever?—I do. I was quartered in Ireland during the famine year, and during the famine fever that succeeded the famine I was quartered in Dublin; there was not sufficient accommodation in the permanent hospitals for fever cases, and huts were extensively erected in various places all round Dublin; they were very rude indeed, simply deal put up and covered with canvas. A great number even could not be admitted into those, and they were treated outside; and I was informed, and indeed I know, that the proportion of recoveries was greater than in the fever hospitals in the stone buildings of Dublin.

9104. In your experience of army hospitals, have you known much mischief to arise from the difficulty of getting repairs effected from the delays in the engineer's department or the barrack department?—There is a great deal of difficulty. At Aldershott I have had less of it than I have ever had in any other station. The duty there is so well conducted by the engineer's department, everything I must say is promptly done so far as in them lies.

9105. Can you suggest any way of simplifying the processes by which repairs may be effected at different stations in England?—Yes; at present the process is this:—I apply, for instance, or the commanding officer of the regiment or the surgeon applies to have a certain repair or a new work done. As regards new work, I should say that I wished to have blinds put up;

there were a number of cases of ophthalmia that were brought to the camp by a certain regiment from Portsmouth, and I wished for blinds to be put up, as I had those cases separate from the other sick. Before that could be done it was necessary to write to the quartermaster-general or to the general, and through him it was then sent to the Horse Guards, and then sent to the War Department, and from the War Department it went to the Horse Guards, and from there to Aldershot to the lieutenant general again; then it was sent to the commanding-engineer, and then it was done. I do not say that any bad results accrued.

9106. It was a long process in case of so small a thing as a new blind?—Yes, I have had a female hospital established in the camp, and I wished to have blinds put on the windows, principally for decency, but in order to obtain them the same process had to be gone through.

9107. How do you propose to simplify the mode of proceeding?—By the commanding engineer and the lieutenant-general commanding having authority to grant, on their own responsibility, repairs to a limited amount without reference to the central authorities, but obtaining their sanction afterwards.

9108. Have you the purveying system at Aldershot?—Yes.

9109. Does it work smoothly?—Yes, because the gentleman who is the purveyor there is a person of very considerable tact and good feeling, who wishes to carry on the duties efficiently to himself and others.

9110. Have you known it work ill elsewhere?—I am sure that it would work ill there if he was a person of a different disposition; if he chose he might, such is the nature of the purveying regulations, give me very much trouble.

9111. He might constantly make objections and difficulties, and refuse you the things you required?—I would not allow him to refuse, and I do not think he would refuse me anything that I required for the sick; I do not think that any purveyor would do that, I would not permit him to do it; but I think if he wishes to go away, or if he has any communication to make to the lieutenant-general, that should be done through me. I should know everything that occurs in my department, and no officer under me should leave the camp without my approval and knowledge. He does not do so, because he always mentions it to me, but I understand that he might do so if he saw fit. In a rough copy of the recent regulations that have been compiled for the purveying department, I have actually read that he is invested with authority to hold independent communication on various matters connected with the department with the higher authorities.

9112. Do you refer to some very lengthy instructions that are supposed to be in preparation?—Yes.

9113. Do you think that those instructions, if carried out, would not place the purveyor on a proper footing in relation to the medical officer?—Yes, I do; and I think they would be very mischievous to the general service.

9114. (*Dr. A. Smith.*) Who is responsible for the medical staff corps serving at Aldershot not attached to regiments?—I conceive that I am; the purveyor manages the accounts.

9115. Have you on any occasion known that the purveyor has recommended a man for furlough without your knowing anything about it?—It has occurred once.

9116. And did he not consider that he was justified and had a right to do that?—That was his feeling at the time, I think.

9117. Has the purveyor on any occasion given you any reason to believe that he could act independently of you?—He has.

9118. (*Sir T. Phillips.*) Whose control does he regard himself as being under?—Strictly under the War Department.

9119. To whom on the spot does he regard himself as answerable?—For certain duties to me, and for others to the lieutenant-general.

9120. To whom would he report his intended absence?—He has been led to understand by the War Department that there is no necessity for him to obtain my permission, except as a matter of courtesy.

9121. (*President.*) He does not understand that he is an officer subordinate to you?—In part he does as to the diet of the sick only, I think.

9122. Does he himself understand that, or is he instructed to consider himself in the same relation to you that a house steward would be in a civil hospital?—Not to that extent.

9123. Have you paid a good deal of attention to the subject of the entrance of medical officers into the profession; and are you in favour of competitive examination on first admission?—Yes, both practically and theoretically.

9124. Would you exact any medical as well as surgical diploma?—I think it would be desirable that the individual should have both a medical and surgical diploma; it would be satisfactory as a proof of his more liberal education, but I would not be satisfied with that alone.

9125. You would take an examination afterwards?—Yes.

9126. Would you include any test of a liberal general education?—I would.

9127. To what extent?—I would oblige a man to produce evidence of his having received a liberal education, and have him examined upon it by competent persons.

9128. Would you require anything like a bachelor's degree?—No; it would be very desirable, but is not essential, and there would be difficulty in obtaining it.

9129. (*Sir T. Phillips.*) What do you include in a liberal education?—Classics, literature, and composition, and, in fact, everything that would enable a physician to investigate disease and to write upon it.

9130. (*President.*) Would you after the examination at once give them an assistant-surgeon's commission?—No; I would send them to a large general hospital.

9131. To Fort Pitt?—Yes, for clinical observations, so that the principal medical officer there might satisfy himself that they were, as far as young professional men can be, competent to treat disease, and to perform surgical operations.

9132. Would you have any professorships for instruction in military hygiene and sanitary knowledge?—Yes.

9133. As is now done in Dublin and in Edinburgh?—Yes.

9134. Would you move those chairs into the hospital?—Yes, I would.

9135. Supposing that the invaliding was moved from Fort Pitt, you would I suppose move the whole of the establishment, the medical school of the army, from fort Pitt to whatever hospital takes its place?—Yes.

9136. That would be to Netley?—If there is no other large establishment, they must of necessity be moved to Netley; but I think it is essential for the medical department of the army, and for the interest of the sick soldiers in the country, that there should be a large military hospital in the vicinity of London.

9137. Why?—For several reasons; the first is, that medical officers would, if doing duty in that hospital, have the advantage after their own duty was over, which is always early, of attending the large hospitals of London, and hearing lectures upon professional and collateral sciences which it is necessary for them to know. They would have that advantage, and also the advantage of associating with the higher classes of our profession in London. I have always found the chief surgeons and physicians extremely glad to see medical officers of the army, and very kind to them in imparting information. It would also be a gain in having the assistance also of the eminent men of the kingdom

*Dr. James
Brown
Gibson, C.B.*

15 July 1857.

who are in London in any interesting or difficult cases either of surgery or medicine.

9138. Would you have a general hospital in or near London, in addition to the invaliding hospital at Netley, or do you think that the invaliding hospital at Netley should have been built in or near London?—Since I first heard that there was to be a hospital built at Netley, I thought that it was an unfortunate selection of a site for it.

9139. That it was removed too far from the great civil schools?—I think that the site is not a good one, it is on the bank of a large tidal river; there is a large surface of offensive mud exposed at low water, and on each side of it there is marshy ground.

9140. Are you acquainted personally with the site? Yes. I have visited it, and looked at it very particularly.

9141. (*Dr. A. Smith.*) Where is there marshy ground?—On both sides; there is a wet meadow between it and Lady Webster's grounds now being drained; it is intersected at this moment with trenches to drain it, and on the other side as we approach it from Southampton is all along at intervals on the right hand side with flags &c., growing in it.

9142. (*President.*) You do not apprehend that Netley, though in a relaxing climate, is more unwholesome than Southampton or the adjoining country?—I think that Southampton is not a good climate for the class of cases that would be in that hospital. The great majority of sick there, if it is to be as Chatham has been, would be invalids from the East Indies, Ceylon, and the Mauritius, and all our tropical possessions, and they want a dry, warm, bracing climate.

9143. Are they not almost contradictions—most bracing climates are cold?—No, I think not; it depends upon the extent to which you carry the term. I think you may in a modified form combine both. Among medical men we generally believe that the vicinity of a large river is a damp place. When I leave Aldershot in the winter it is beautifully clear, but when I come to London there is a dense fog. In Sydenham it is a dry soil, a dry gravelly chalky soil, highly situated, with a beautiful aspect, and it would afford the sick the immense advantage of the Crystal Palace.

9144. Are you aware that the site of Netley Hospital is on a bed of gravel?—Yes.

9145. Can you have a better or a drier foundation?—No, and if everything else was combined it would be better, but the bed of gravel I think is not more than a certain depth, and then it is thick clay underneath, which is the cause of the ground on each side of it being marshy.

9146. It has been stated before this Commission by an engineer officer that they have dug down as low as 30 feet without coming to the end of the gravel?—And without getting good water either, where they are now boring, which I was informed is about 130 feet deep. The gravel is on the surface, and then they come to clay, and then it is presumed that there is chalk under it.

9147. The fact, as stated by the engineer officers, that they have bored through to 30 feet without leaving the gravel, militates against your statement?—Yes, but I was there on Sunday last.

9148. You did not go down to 30 feet?—No, but I saw a bit in the cutting—it is exposed.

9149. Where the ground has been excavated for the building you saw clay under the gravel?—Yes, I saw the strata.

9150. (*Dr. A. Smith.*) Where did you find clay there below gravel?—In that cutting.

9151. Or sand?—Clay.

9152. Not the green sand?—My impression was that it was clay, and it was the impression of the men about that it was clay. My impression was that there was about five or six feet of gravel, and everything else below the surface was clay.

9153. After a probationer has passed a certain number of months in a large military hospital, do you contemplate giving him another examination to see

whether he has taken advantage of the lectures that had been offered him there?—Yes, I think so. On those things and the collateral branches of military hygiene. Personal observation alone is the only certain and safe test of clinical knowledge, that is the actual treatment of disease, and that cannot be obtained by any examination, I think.

9154. Then you would recommend that after that examination, if he passed it satisfactorily, he should have his commission as assistant-surgeon?—Yes.

9155. Would you give him any further examination in after life?—Yes; I think that at every stage that a medical officer passes through, up to that of deputy-inspector, he ought to undergo an examination.

9156. You contemplate that being a standard examination, not to affect the order in which a man should go up from one rank to another—you would not let a man who passes a higher examination pass more quickly into the rank above than the man who passes a medium examination?—Certainly not; I would have all properly qualified.

9157. Do you confine these remarks to the promotion to the rank of surgeon?—No; I would examine an assistant-surgeon before he became surgeon, and I would examine a surgeon before he became a first-class staff surgeon.

9158. What kind of examination would you give to a surgeon who would be a man of some standing, who had been practising his profession, and had acquired much experience?—A higher degree of knowledge is expected from a man who has been 10 or 20 years in practice.

9159. Though he might have much higher practical knowledge, might it not be of a character that would not show as well upon examination, as in the case of young men fresh from the schools?—Yes; but in this large hospital, if it were in the vicinity of London, there would be an opportunity of testing his positive clinical and practical knowledge; both in medicine and surgery.

9160. (*Sir T. Phillips.*) Would you send him back to his anatomy and physiology?—Yes, I would, and I think it would be a great advantage.

9161. (*President.*) Do you propose to give any leave for the purpose of studying in civil hospitals?—If it be impracticable to have a large hospital establishment in the vicinity of London, I think it would be very desirable to give leave of absence for such a purpose.

9162. (*Mr. J. R. Martin.*) Would you have a roster of duty for the colonies so that medical officers might come home periodically to enjoy the advantages of study?—Yes, every five years. I would have every medical officer return to England; he should not be absent longer than five years.

9163. (*President.*) Do you contemplate a roster for all foreign service?—Yes.

9164. Advertise so that the officers should know what their prospects are?—I do not know that the public press would be the right place, but I think there ought to be a code of regulations for the department, or it should be communicated to them by the director-general.

9165. Have you any suggestions to make on the subject of the rates of pay now received by the medical department?—I think that the rates of pay ought to be increased in all the grades.

9166. You have seen, I daresay, the different scales which have been put forward, one by some medical officers in the Crimea, and another by the director-general in the appendix to Mr. Stafford's committee?—I have not read it.

9167. Have you any scale of your own?—With the exception of that in a recent number of the Army and Navy Journal, the only scale that I have seen is one that was sent to me from Chatham, and printed. I do not think that I have read it through.

9168. Have you any written scale that you can put in?—The scale that approaches most to my own view, with some modifications with regard to the assistant-

surgeons, and to which I have referred, is the one that was published in a number of the Army and Navy Journal.

9169. The assistant-surgeon now has 7s. 6d., what would you give him?—Ten shillings.

9170. With any rates of increase after a certain period of service?—Yes, after ten years; my idea of an equitable scale is something comparatively with what an individual of the highest class would gain in civil life.

9171. A man in civil life, if a very clever man, sometimes gets 10,000*l.* a year?—Those are the exceptional cases; it is essential to provide a young medical man without income with money; they cannot commence in civil practice without money, and in the army it is essential to give him the means at first.

9172. Would you take into consideration the average number of young men in civil life who attempt to obtain practice and never succeed in getting any?—To a certain extent I would, but if we admit men of that grade into the military department in the army, which we ought to do, it is essential for their position as gentlemen that they should receive sufficient means to keep up their position.

9173. Do you take into consideration that in the army service an officer is lodged, and the civil practitioner has to lodge himself?—Yes.

9174. How do you ascertain the average of the civil profits?—Being in a cavalry regiment, I have moved throughout the towns of the kingdom in England, Ireland, and Scotland, and I generally became acquainted with the medical practitioners of the towns in which I have been quartered. And a medical man must have means in some way; he must either have an income, or have money to buy a practice; and if he has means, in the course of four or five years he will be earning an income of 200*l.* or 300*l.* a year at least.

9175. But you would give an assistant-surgeon 200*l.* or 300*l.* a year at once?—200*l.* a year is, I think, essential.

9176. You give him a little more at first entry to secure to him the means of maintaining himself respectably, and then you would give less in the other ranks?—I do not think it is possible for an assistant-surgeon to live in the army as a gentleman without always being in difficulties, and using the most rigid economy, upon less than 10*s.* a day.

9177. With 10*s.* a day, what do you consider an assistant-surgeon's position is worth to him?—Though his actual expenditure in barracks may not consume 10*s.* a day, his regiment may be on the march, and there is the wear and tear of clothes, &c., so that it would be a mere maintenance to him.

9178. What do you think it is worth to an assistant-surgeon?—The accommodation that an assistant-surgeon gets would not be worth more than 5*l.* or 10*l.* a year; he has only a single room.

9179. He has two, has he not?—No.

9180. You would take into consideration the prospective pension?—Yes; but if he were a civil practitioner, a gentleman of high education and competent to practise, and had spent his life up to 60 or 65 in his profession, I should expect from the time he had been 35 years in practice he would have accumulated a fortune, the interest of which would be much greater than any retiring allowance a medical officer is likely to receive; his practice would have been so great, I think he would have realized money.

9181. From your practical experience in country towns, do you think that many practitioners reach 1,000*l.* a year; I do not speak of towns like Birmingham?—I think Northampton is a fair average town, and I knew the late physicians Drs. Kerr and Robertson most intimately; Dr. Robertson is a man both in civil and professional life of the very highest standing and integrity, and he told me that some years ago, for many years, his practice had been worth 2,500*l.* a year, and one year it was 3,000*l.*

9182. Are there many other practitioners in Northampton?—Dr. Kerr also.

9183. And others?—Yes, and all realizing considerable incomes.

9184. Putting them all together, dividing the income among them, would they have as good an income as a deputy inspector, including his lodgings and including the prospect of a pension?—I do not think that is a fair case to put; we suppose that a medical officer has the highest attainments necessary for success, but there are a number of practitioners in every town who do not possess those attainments.

9185. You have, in considering the rates of pay in the army, the advantage of certainty?—Yes.

9186. Do you consider that your preliminary competitive examination would exclude from the army all those who were unfit to obtain practice if in civil life?—Yes; and I think that all the persons whom we would obtain under those circumstances would, other circumstances concurring, having an income, or money to purchase a practice, and would attain the highest practice.

9187. Can you put in your scale of pay which you propose for each rank?—I will do so.

9188. Does it include additional retirements or alterations in the present rates?—Increased retirements.

9189. After what periods of service?—After 25 years.

9190. Not 21 or 20 years?—No.

9191. You would think them too young to retire after that service?—I think that very few medical officers would avail themselves of it, and I think it would be disadvantageous to the service if they did, I think that the services of medical officers, after 20 years' service and upwards, are extremely valuable to the country. I think it would be a very great loss to the service, and not much gain to the medical officers. It is remarkable how few officers in health have availed themselves of the 25 years retirement.

9192. After 20 years' service, practically, most men in the service are engaged in administrative inspectional duties, not in the treatment of the sick?—Until very recently it was quite the reverse; it was not until they attained 30 years' service, or very nearly.

9193. (*Sir T. Phillips.*) How long have you been deputy inspector?—Two years.

9194. (*President.*) In what year did you enter the service?—The 14th December 1826.

9195. Do you propose that the retirement should be compulsory?—After 35 years.

9196. With regard to half pay, do you propose any alteration?—I do not think there is any such thing as half pay.

9197. But there are the rates which are given on reduction, or which are given when officers are on the sick list?—I think that if an officer is removed from the service from any cause, except reduction or disease, under 25 years' service, he should not receive so high a proportionate pay as the man who leaves after 25 years' or after 30 years' service. I think that those who serve up to 35 years' service should receive a proportionate allowance. If a man retires to suit his own convenience under 25 years, he should retire upon a very much less retirement in proportion than if he serves on for 25 years or 35 years. I think that his services are so valuable in proportion to the length of service up to 35 years, that he should have a proportionately large retirement.

9198. Will you include the rates of retirement in the paper which you will give in of the scale of full-pay and half-pay?—Yes, I will.

9199. With respect to promotion, what is the present rule as to promotion in the lower ranks from assistant-surgeon to surgeon; is it governed by seniority or selection?—I think on stations it is done by seniority; and not only the rule but the practice has been so on the stations; and assistant-surgeons, in consequence of one being in Canada and another in Ceylon, have been promoted over the heads of each other.

*Dr. James
Brown
Gibson, C.B.*

15 July 1857.

Dr. James
Brotten
Gibson. C.B.

15 July 1857.

9200. Is the practical result to give men pretty nearly their turn of seniority according to the Army List, or does it operate very unequally?—Promotion has been very slow in India; assistant-surgeons in India have been long in getting promotion, consequently those on other stations have gone considerably over their heads, I think—I cannot state to what extent.

9201. Some good officers get promoted from assistant-surgeon to surgeon after 6 or 7 years, and some are 10 or 11 years before they are promoted?—I should think that 10 or 11 years in India is very common for assistant-surgeons.

9202. With regard to the rank from surgeon to first-class staff surgeon is that by seniority or by selection?—According to the director-general's evidence in the committee of the House of Commons last year I see it is by both.

9203. Sometimes by seniority and sometimes by selection?—Yes.

9204. The fact of a senior being taken does not prove that it is not selection; you may select a senior as you might select a junior?—Yes, entirely so; the motive no one knows but the director-general.

9205. You are of opinion that seniority ought to be maintained in the rank from assistant-surgeon to surgeon?—In every grade throughout I do not think that it ever ought to be departed from, taking care, that medical officers are qualified for the respective ranks above them by oral and clinical examinations and by giving them an opportunity of cultivating their knowledge of the profession; whatever good men we may obtain, unless we give them an opportunity of cultivating their profession afterwards, which they have not now and have not hitherto had, they do not advance in knowledge to the desired extent.

9206. If you select an officer for administrative and inspectorial duties, duties which require great tact and command, gifts which some men have and some men have not, how would you get at that by any examination?—It could not be got at by an examination, but only by the observation and reports of the deputy inspectors of hospitals, who are men of ability, integrity, and knowledge; that is the reason that I would examine and have such a test of staff surgeons to see whether or not they have administrative qualities. I would expect that a regimental surgeon would be as competent to treat disease as a staff surgeon, if of equal standing, he being examined and having the opportunity of attending a large hospital, and of having access to the periodical and other press of the country; but he may have all that, and be a most excellent surgical and medical practitioner, and yet possibly be, as you have suggested, deficient in administrative capacity.

9207. How would you ascertain that?—By his being under an inspector or deputy inspector who could ascertain that.

9208. That comes to selection, does it not?—No.

9209. (*Mr. T. Alexander.*) If he did not possess the necessary qualifications, what then?—I would remove him.

9210. (*President.*) Is not that selection; you do not call it seniority?—Yes, I do. I think that the director-general, with regard to a staff surgeon or any administrative officer, has the means of knowing what he is as an administrative officer; I think, with regard to a regimental or assistant surgeon, he has not the means of knowing their merits, but as to administrative officers he has, particularly if they are serving in England at any station of importance, as they must be in constant communication with him, and he will find out very soon whether they possess those administrative qualities which they ought to possess.

9211. You having ascertained, that of two men who stand first and second on the Army List, No. 2 has got those qualities, and No. 1 has not, what would you do then?—I would remove No. 1.

9212. Where?—I would place him on half-pay.

9213. And take No. 2 and promote him to be a deputy inspector?—Yes.

9214. Is not that selection?—No, not strictly so.

9215. (*Sir T. Phillips.*) Would it be just to remove a very good executive officer because he does not happen to possess administrative qualities?—I think that the service requires it.

9216. The service requires that you should retain him in the executive rank?—I think that he would feel himself degraded, and that his usefulness would be taken away from him.

9217. (*Mr. T. Alexander.*) Then you ought to let him retire of his own accord?—Yes; I think it could be managed.

9218. (*Mr. J. R. Martin.*) Is not that done in all other promotions in the army; are not commands and staff appointments conferred upon the ground of character, rather than upon the ground of seniority?—In the two branches of the service which are the most accomplished, the members of which hold the highest rank in intellectual attainments and efficiency, who stand the highest in social and harmonious feeling to each other, the rule is promotion by seniority, and is never departed from,—in the artillery and engineers.

9219. Is it not very much complained of as constituting a dead sea of seniority, and does not that cause the officers to be too old by the time they arrive at a command?—No; I think that the new system of promoting officers to a higher grade, after three years' service, will remove in time that disadvantage to the service.

9220. (*President.*) Does not that system pass a lieutenant-colonel, who has the good luck to obtain a command over the heads of all the lieutenant-colonels who have not?—Yes.

9221. Is not that a way of getting some young men up into the senior ranks of the army while they have the vigour and energy of youth about them, and does not the service gain by that?—Yes; and I think for that very reason it should be carried out to its full extent.

9222. It is only by passing one man over the others that you can keep them young?—It is only a question of the country paying a little more to induce the older officers to retire.

9223. (*Sir T. Phillips.*) Would you choose the commander of an army by seniority?—I think that if the contemplated alteration in the education of officers is followed up, every officer who becomes a lieutenant-colonel will be fit for command, and I think that the exceptions will be few.

9224. You know that there are many men possessed of the very highest qualities, and others possessing them in an inferior degree—would you take the inferior man because he was senior?—I assume that if it is possible to educate the officers of the army so as to fit them for command, there are always means of finding out whether an officer is fit to command or not without doing injustice to an individual.

9225. (*President.*) If you took 50 young men by chance, and gave them all an excellent education, would it follow that the man who stood first in seniority would be the man who had taken the best advantage of the education and be the ablest man?—I think that it ought not to be discretionary with him to take advantage of it. I would force them to take it, and let them all pass through a compulsory education.

9226. Do you think that any amount of education can equalize the intellects of men?—Certainly not; but I do think that an individual who is so deficient in capacity as not to be able to take advantage of a proper system of education, should be removed from the service at an early period of his service. If having the capacity, he does not avail himself of it through idleness, I do not think it is any injustice to remove that man.

9227. (*Mr. T. Alexander.*) Are not some men not fitted for command, and others again who are afraid of responsibility?—They are quite unfit.

*Dr. James
Brown
Gibson, C.B.*

15 July 1857.

9228. Therefore should one of those men become a senior, would you place that man in a position for which you know he was not fitted? Supposing a lieutenant-colonel is unfit for the command of his regiment, is it right that that man should be allowed to continue in the command of his regiment?—I do not think that it would be right; that commanding officer might be placed in a most dangerous position, and the whole fate of an army might depend upon him.

9229. (*President.*) Is not that a reason for selecting the very best man for the post; take, for instance, the general commanding an army, everything may depend upon him?—If you remove incapable lieutenant-colonels you will have efficient general officers.

9230. Would you get in that way a body of men every one of whom would be equally fit for that which requires the highest civil and administrative qualities of any post in the world, that of a general commanding-in-chief a large army?—Yes, I would, if the thing is carried out in its integrity.

9231. How many commanders of military eminence should you say that this country has ever produced, would you say half a dozen?—I think that we have had a great many men who have never been tried.

9232. Do you think that there have been many men who were equal to the Duke of Wellington or the Duke of Marlborough?—Yes, I do.

9233. (*Mr. J. R. Martin.*) Are you aware that in the Indian army, where all the promotion is rigidly by seniority, the commanders are never appointed there upon the principle of seniority, but always on the principle of selection?—I am not aware of that.

9234. You are advocating what you consider to be the interests of your department in urging the seniority principle of promotion, are you not?—I am advocating what I think would benefit the department and the public service.

9235. Does not promotion by seniority lose all view of the welfare of the soldier?—I think not, if you take care that every surgeon of a regiment is an excellent surgical and medical practitioner.

9236. (*President.*) How would you supply the inducement to exertion which selection for merit gives if you adhere to the rule of seniority?—In the first place, by professorships in the military hospitals; I would have those only for five or ten years, so that it might embrace a large circle of usefulness. I would have appointments to staffs and to regiments in India for men who particularly showed conspicuous merit. I would have the surgeons of cavalry regiments in this country appointed in the same manner, and give all strictly government medical appointments to the most meritorious officers.

9237. Such as what?—Such as the appointments to the civil prisons under the patronage of the government; and officers of health, &c., I would have all the medical appointments under the patronage of the government—of course there is nothing that one has a right to—I mean that we have no claim for anything beyond the will of the government; but I do think that a military medical officer, if there is such a thing as right, is the person who has a right to all government appointments, and that civil medical men have a right to all corporation and county appointments.

9238. You would reward the military medical profession by giving them situations out of that profession in civil appointments. You would reward a man by taking him out of his profession?—No, you would keep him in it; if a man after 25 years' service has served the country with great advantage, he should be allowed to retire in that way, and would still continue in his profession and in usefulness to the public.

9239. You said that after 25 years' service a man is unfit for further service and must be retired?—I have not said that.

9240. I think you said that after 25 years' service you would give him optional retirement?—Still I would rather that he did not accept of it. I think that it would be a great loss if a good medical officer retired until after 35 years' service, unless from

damaged health. From the time that we embark in the medical profession until we die we are never perfect in it. If we live 100 lives the more we are engaged in duties the better we are.

9241. Would you put a man as a reward in a post where he has less to do, say in a cavalry regiment?—I would put a man who had shown a taste for his profession in a position where he might cultivate it still further; he should be a cavalry surgeon, as he is the only medical officer in the army who has a real opportunity of cultivating his profession.

9242. (*Sir T. Phillips.*) For what purpose should he cultivate his profession, to do less work, or to go back into an infantry regiment?—For further promotion in his turn.

9243. (*President.*) At present I understand that a cavalry medical officer does not receive promotion?—That has been the rule. Since the commencement of the war cavalry surgeons have.

9244. You received promotion direct from a cavalry regiment?—Yes, but not till I went to Turkey. When I returned to the 17th lancers that regulation was not in operation, or if it existed it was not acted upon. For some years cavalry surgeons were promoted from cavalry regiments. I was at Malta when I was gazetted to the 17th lancers. I did not apply for it, the regiment applied for it. I never entered into any arrangement to forego my promotion. I was offered promotion afterwards.

9245. (*Mr. T. Alexander.*) According to your statement of services you say that from 1826 to 1854 you had 18 years' home service?—From 1826 to 1835 I was in the unhealthy colony of Demerara, and the subsequent year in Barbados. In consequence of the frequent illness and removal of medical officers from disease, I was several years in charge not only of my own regiment, but of the whole of the civil and military staff, with 300 military labourers, a company of the 1st W. I. regiment, and a detachment of the royal artillery, as well as the 86th regiment for nearly a year, and I have received letters of thanks and approval from the medical board, and from all my medical and military superiors.

9246. (*President.*) As deputy-inspector at Aldershot do you make reports of the officers under you? Yes, in this way. My instructions are, in addition to my casual visits to the hospital, to make a formal monthly inspection of each hospital, and at the end of the inspection fill up a return for the director-general, stating the condition of the hospital, the condition of the books, and the condition of the kitchen.

9247. Do you make confidential reports of the characters of the officers under you?—Never.

9248. Not in case of misbehaviour?—Except any remarks in the return.

9249. Is that an open return?—Yes; I never made a confidential report of any man since I have been at Aldershot; there was an officer in the camp who set aside my authority, and I reported him to Dr Smith. I reported him to the lieutenant-general in the first instance.

9250. Did you communicate to him that you had made a report against him?—I told him that I would do so.

9251. (*Mr. Stafford.*) What is the matter with the water at Aldershot?—As to wholesomeness it is exceedingly good, but as it passes away through a stratum of clay and green sand, impregnated with iron, it tastes unpleasantly and smells unpleasantly. Several of the wells do, but it is very wholesome. Last year there were very few severe bowel complaints there, although they were very severe throughout England.

9252. Do you get your water from Cæsar's camp?—The south camp in part is supplied from Cæsar's camp.

9253. (*President.*) That is fine water, is it not?—Essentially fine, but often it is muddy and turbid.

9254. (*Mr. A. S. Stafford.*) Are the wells dry?—Not entirely dry; the north camp is entirely supplied by wells, for there are no tanks or reservoirs.

Dr. James
Brown
Gibson, C.B.
15 July 1857.

9255. (*President.*) Have you ever contemplated the necessity of appointing a sanitary officer to an army in the field?—Yes; I would have the principal medical officer of each division responsible for the sanitary condition of his camp; of course the inspector-general in charge of the medical department in the field is the responsible person, but under him I would have other officers.

9256. That is the present system?—Yes.

9257. You do not contemplate any change in that?—No, none can be better.

9258. Under the present system do medical officers consider that they are bound to look into all sanitary questions and give their advice to the commanding-

officer, and do commanding officers consider that they are bound to take it and to follow it?—I do consider that it is their duty; they are quite competent to do it and they do do it, but commanding officers do not always pay attention to them, and even higher authorities do not carry out their wishes and meet them with that promptitude that they should; I think that it would be attended with great inconvenience in England to have civil sanitary officers attached to the army. In the Crimea the army was placed under peculiar circumstances; but in the actual movement of an army in the field, I think that if there were one hundred sanitary officers, the chief officer of a division should have power to look to that.

The witness withdrew.

Francis G. P.
Neison, Esq.

FRANCIS G. P. NEISON, Esq., examined.

9259. (*President.*) I believe you have had great experience as an actuary?—Yes.

9260. Have you turned your attention very much to the subject of the comparative rates of mortality, in different occupations and classes?—Yes, I have given a very great deal of attention to it.

9261. Looking at the examination of recruits by the surgeons, who reject every man with any sign of infirmity or incipient disease, do you consider that the soldier is a picked life?—I think that they ought to be picked lives. There is a return of the recruiting department which bears very markedly upon that question. I find this very significant result in the return of the recruits examined in the years 1837 to 1842, five years, that out of 93,652 enlistments as many as 26,768 had been rejected in all as unfit by the district staff surgeons.

9262. (*Sir T. Phillips.*) Does it appear that they were rejected for physical unfitness?—Yes, the various causes are assigned in this return, and 25 per cent. of the whole rejections are from causes that may be assigned to chest affections.

9263. Does that at all represent the proportion of the population affected by chest disease, so far as there are any means of forming an estimate?—It is not so high a proportion as those that are found in the public generally at the same ages, and obviously it would be so, because the markedly diseased would not present themselves for enlistment.

9264. (*President.*) The rejections do not give the numbers of the population in proportion, as diseased men would not offer themselves at all as soldiers?—Certainly not; those are rejected by the district staff surgeons only, but they are provisionally inspected prior to appearing before the district staff surgeons; and having passed in the sub-districts they are sent to the district staff surgeons for examination and are rejected; more than this number might be rejected provisionally; for instance, in a small village, if an enlistment takes place, there is a medical officer there who provisionally inspects the recruit, and if not rejected he then goes to the district town, say to Bristol, to the district inspector and there he is enumerated, and is returned in the list I have referred to, but the provisional rejections are not noticed at all.

9265. They will be plus the number that you have given us?—Yes; it appears to me that there is a large amount of sifting in order to have men esteemed well fitted for the service.

9266. (*President.*) Is there not another process that ought to tell upon the rates of mortality of the soldier, which is the weeding out that takes place by invaliding weakly or sickly men?—Yes, that ought to tell on the residue.

9267. *Cæteris paribus* at first sight you would say that a soldier's life ought to compare more favourably with other classes and trades?—Yes, I should be prepared to expect that.

9268. What class is the soldier drawn from?—Chiefly from the agricultural labourers and the population of small towns—not of great towns.

9269. How do those classes from which he is drawn stand as compared with the rest of the population; are they a healthier or a less healthy class?—They are a healthier class; I now understand the question to be how do the districts out of which the soldier is selected stand to the average of the whole community. He is drawn from a class that is healthier undoubtedly.

9270. The soldier is provided by the government with food, with lodging, with clothing, and in case of sickness he is at once treated by the government, and therefore he is better off than the average of agricultural labourers?—Yes.

9271. He is in the same position as a labourer if he was a member of a friendly society?—Yes, as nearly resembling the conditions as possible.

9272. How will the soldier compare, judging by the rates of mortality, with an agricultural labourer being a member of a friendly society?—With regard to agricultural labourers members of a friendly society, there is one simple form of answering the question; for every death taking place among agricultural labourers who are members of a friendly society $2\frac{8}{10}$ would take place among the army generally. (*See App. No. LXXI.*)

9273. (*Sir T. Phillips.*) At what ages are you assuming?—I am taking the precise ages as given in page 31 of the blue book on the health of the troops, taking the precise distribution of ages as given there.

9274. (*President.*) You take males of the same age as those represented in the army statistics as being the ages of soldiers serving?—Precisely; there is another point of some importance to observe in making a comparison, that is it would not do to assume a period of life from 20 to 40 years of age, there are a few men below and a few above these ages, for you have an undue proportion of the whole number nearer 20 than 40, and the average mortality would not fairly apply. I have taken the precise distribution as it appears in the army returns; in fact, I have shown in detail how the results are affected at each term of life; it will be seen not only for the aggregate result but for each particular period of life; of the whole results—for each death taking place among agricultural labourers members of friendly societies $2\frac{8}{10}$ deaths will take place among the soldiers, or otherwise for six deaths in one thousand agricultural labourers there will take place amongst one thousand soldiers similarly distributed, in the infantry $17\frac{8}{10}$.

9275. The agricultural labourer who is a member of a friendly society must be a provident man, and being provident he is probably a sober and industrious man; his health would benefit by the moral quality that is wanting in the soldier who is put into an hospital when ill, and who is fed whether he is sober and industrious or not; can you show a comparison between soldiers and agricultural labourers, irrespective of their being members of friendly societies?—Yes

I think it would be right to explain that it is not the moral tone or quality of the agricultural labourer that affects his mortality, but it is the social conditions that flow out of that quality.

9276. It is his moral state which affects his physical condition?—He is uniformly sober and temperate, having a fair allowance of food, and being tolerably well clad; but it is easy to suppose a man of the highest possible moral tone, but not possessing those conditions, who is subject to a higher rate of mortality, but the conditions which are incidental to his moral status are no doubt those which favour the rate of mortality.

9277. How will that comparison come out?—The mortality would stand thus,—for every one death taking place among the rural labourers generally, not members of friendly societies, $2\frac{1}{10}$ deaths would take place among the army.

9278. Have you put together the household cavalry?—Yes. I can give it for each branch of the service.

9279. Will you give it for the infantry of the line?—That would be $2\frac{2}{10}$ in the infantry of the line. Another way of stating the same result is, that while eight deaths in 1,000 take place in the agricultural labourers, not being members of friendly societies, $17\frac{8}{10}$ take place in the infantry of the line.

9280. But then a soldier is generally quartered in towns, and his duty, though it is out of doors, does not occupy much of the day; how would he compare with the classes in towns whose occupations are out of doors?—Taking the same mode of comparison, still with those not members of friendly societies, and taking occupations generally, then for every death taking place amongst the out-of-door occupations generally in towns, there would take place in the infantry of the line, as that is the great body under inquiry, forming 60 per cent. of the whole army, two deaths as nearly as possible.

9281. When you say trades in towns, with outdoor occupations, what kind of trades do you mean?—A great variety; a full list is given in notes VII. and VIII. of "Contributions to Vital Statistics." There are butchers, coachmen, college porters, constables, costermongers, horse keepers, and parties in Her Majesty's Customs. Those are the people not requiring very much exercise. Then there are others requiring more physical exercise, such as boat builders, builders generally, brickmakers, bricklayers, carriers, and draymen. In the results that I have now given, all of the out-door occupations are taken, a few are not selected, but they are all towns in England having populations of more than 5,000.

9282. A soldier's time is mostly spent in barracks, and his drill is not above two hours in the day, therefore to get a fair comparison you should go to the trades whose business is carried out but very partially in the open air?—That shows more favourably for the soldier; the mortality is higher in that class. For every death taking place amongst those classes just mentioned, namely, those partially in-door occupations and partially out, still in some towns $2\frac{1}{10}$ th deaths would happen in the infantry. In other words, for every $8\frac{1}{2}$ deaths per 1,000 in those towns, you would have $17\frac{8}{10}$ ths, as before, in the infantry of the line.

9283. But a soldier is subjected to night duty, which those trades are not; will you compare them with printers, who work at night?—In that case for every single death taking place among the printers, not quite two deaths would happen in the infantry of the line, or about $1\frac{9}{10}$ ths.

9284. (*Sir T. Phillips.*) Does not that nearly represent the mortality of all England?—The printers are as nearly as possible the average, but still those figures are taken from independent results.

9285. By which I mean that the night occupation does not appear to have really affected the value of life?—I think that that might be shown.

9286. (*President.*) The printer works under cover, and is not exposed as the soldier is to the inclemency

of the weather. Take a policeman, who does eight hours' consecutive duty for seven nights in a week during eight months, and show what the comparison is with him?—As to policemen, for every two deaths taking place in the infantry of the line, it would be one for the policemen, but taking the average of the whole of the troops, it would be different.

9287. The deaths per 1,000 of policemen being how many?—About 9 in 1,000.

9288. As the policeman on the average serves but five years, and is then got rid of by invaliding and resignation, it is not a fair comparison with the soldier who serves for 14 years. Can you compare the policemen with the infantry of the line in the first five years of service, dating from the age of 20?—That can be done. It happens that the mortality of the infantry of the line at the time of life now alluded to, 20 to 25, is precisely the mortality of the average.

9289. Then there is the advantage to the soldier of his being younger by five years. How would it be if you compared the policeman with the soldier between 25 and 30?—There is also a somewhat unexpected answer to that. The data from which I have drawn these deductions refer to the experience of eight years, from 1830 to 1838 of the police, and then his average age at admission was $28\frac{1}{2}$ years, which is as nearly as possible the average age of the troops, so that so far the comparison was similar in that respect. But from a recent return for the last five years of the metropolitan police, I find that the average age on admission, from the year 1852 to 1856, has been about 24 years. Younger men are admitted than formerly, and coincident with that there has been a slight reduction in the mortality. The mortality during the last five years has not been quite so great as in the first eight years, and that difference is just about the difference that would, under a normal state of things, be due to the difference of age; but instituted as a comparison, in the manner suggested with the soldier, it does not alter the result.

9290. The soldier from 25 to 30 gives about the same rate as the policeman?—No, it is still double; the mortality at that period of life and the average of the whole is just the same.

9291. Will you compare the soldier with the miner working under ground by shifts day and night?—Then in that case, for every death taking place amongst the miners, $1\frac{7}{10}$ ths would happen amongst the infantry of the line, or in other words, $10\frac{3}{10}$ ths would be the mortality per 1,000 of the miners, whereas it is $17\frac{8}{10}$ ths in the infantry.

9292. You speak of the troops in Great Britain?—No, in Great Britain and Ireland.

9293. (*Sir T. Phillips.*) Does that apply to the mining population of Great Britain, or to the mining population of any particular districts of Great Britain?—I have excluded from it the Cornish miners. I have taken the collieries and lead mines worked by shifts.

9294. Have you taken the mining population of South Wales?—Yes.

9295. (*President.*) What trade will compare on an equality with the rates of soldiers?—The only rates that can be at all compared is the class I have denominated clerks, chiefly counting-house clerks.

9296. They are the worst of all?—Yes, the worst class, except the intemperate class of the community. They are the worst that I have found in connection with a friendly society—the worst mortality of that class I am aware of. These results and some physical conditions connected with them bear in a remarkable manner upon the health of the army. I think I can show that to a considerable extent at least, the high mortality of the troops is due to the want of the right sort of physical exercise. If you follow the element of physical exercise in any class of men, you will have a better index pointing to the rate of mortality than any other. If you take occupations, the mass of them, irrespective of the exercise which

Francis G. P. Neison, Esq.

15 July 1857.

Francis G. P.
Nelson, Esq.

15 July 1857.

those occupations call forth, you will find very contradictory results. For example, you will find this unexpected result, that in a great number of in-door occupations the health is much better than in out-door occupations. There is a very striking example of that, and I am not aware of anything that has appeared to contradict this view of the question not even among a very small number of observations. Take those occupations which require great physical exercise, and put them in one group and see the rate of mortality to which they are subject, and compare them with any other group requiring little physical exercise, and so far as I am aware you will invariably find that those occupations requiring a greater amount of exercise show a greater duration of life.

9297. (*Mr. J. R. Martin.*) Has not defective ventilation much to do with the mortality of which you speak?—I think not. I have materials illustrative of that very point. The average deaths among clerks are 18 in 1,000.

9298. (*President.*) Does not it go as far as this, that trades requiring great exercise in-doors will give better rates than trades requiring little exercise out of doors?—It will. The classes are enumerated in the notes I have already referred to. Notes V. to VIII. inclusive show the trades over which those observations extend. Suppose I take the expectation of life at the age of 30 as being something like a mean age for the soldier, and an in-door occupation requiring little exercise, the expectation of life at the age of 30 would be 35 years; but in an out-door occupation also having little exercise the expectation of life would be no more than 30 years. That would seem to have some bearing upon the question of mortality as a proof that good ventilation does not make up for some other quality which is possessed by an in-door occupation. But the striking difference is in the comparison at the same age with an in-door occupation requiring great exercise, in which the expectation of life is $34\frac{1}{2}$ years, and of an out-door occupation with great exercise, in which it is $36\frac{1}{2}$. It is somewhat remarkable here that the great exercise raises the value of life in an out door occupation $6\frac{1}{2}$ years, and if the trades be looked to over which those observations extend, the distinction between little and great exercise in an out-door occupation is a much greater distinction in regard of the exercise itself than it is in an in-door occupation. Hence you find that the little exercise in in-door occupation and the great exercise have very nearly the same result, or they do not differ widely. But if you take it at other ages it would be different. In the case of those more advanced in life invariably greater exercise shows greater duration of life; but the difference between little and great exercise always being less in in-door occupation than in out-door occupation, the out-door occupation is throughout less than either of the in-door occupations, if the out-door occupation is accompanied with a little exercise.

9299. This is how you account for the low rates of mortality among agricultural labourers, who are, you may say, compared with other classes, as ill fed, ill clothed, and ill housed as anybody?—Yes; I have not the least doubt that the real solution of the greater prolongation of life among agricultural labourers, consists in the healthful exercises to which they are subjected.

9300. And the varieties of them?—Yes; in fact, every muscle of the human frame must live, and it is one of the natural functions that the muscle is to be called into action, and if it is not so, it will assume the form of disease immediately.

9301. (*Sir T. Phillips.*) You have little exercise in in-door occupation at 35 years, and great exercise in in-door occupation at $34\frac{1}{2}$ years?—That is the only place you will find where it is so. Take the age of 21, it is 41 against 42; take the age of 50, it is 20 against 21, even in in-door trades.

9302. (*President.*) Is there any marked distinction in the mortality per cent. of agricultural labourers,

over the residue of the population in the same agricultural districts?—Yes; you will find, take the decennium 20 to 30 years of age, the mortality per 1,000 is 6 among the labourers in a rural district; but with regard to the residue of that district, the mortality is $8\frac{2}{10}$ per 1,000.

9303. (*Sir J. Clark.*) Including farmers?—Yes, and small tradesmen. Rural districts and villages, and places not villages, having a less population than 5,000; from ages 30 to 40 the results differ very little, the mortality being nearly in the same relation; it is as nearly as possible the same. But in the period of life 40 to 50 years of age, for 8·2 per 1,000 in the labourers of rural districts, there is 10·4 per 1,000 in the residue.

9304. What does the 8·2 become, from 30 to 40?—It becomes 6·04 per 1,000 for labourers and 8·02 for the residue, being nearly the same distinction as as for ages 20—30.

9305. It would seem, from the estimate which you have given of the expectation of life at 30, that in-door occupation is beneficial, and is an advantage. For instance, little exercise, in-door occupation, is 35; great exercise, in-door occupation, $34\frac{1}{2}$; little exercise, and out-door occupation, 30; great exercise, out-door occupation, $36\frac{1}{2}$; so that the great exercise out-door occupation is only a little more beneficial than the little exercise in-door occupation?—Yes, and there is a very evident answer to that; the way in which the comparison is made is to show the influence of one element, that is, exercise and fresh air; the generally received opinion being, fresh air is invaluable to health, and confinement within doors is very injurious. Now that opinion, which is very generally received, I do not believe will bear the test of a strict inquiry; and I believe, that exercise is really the ruling element throughout the whole of life. If you take the in-door occupation, though the particular quinquennium now cited shows disadvantageously for great exercise, still at all the other periods of life it is otherwise. It may be stated, as ruling throughout all those results, that great exercise, other conditions being the same, will show a prolonged duration of life.

9306. Take the cotton spinners; in what class do you put them?—I have got them, they will be found in page 454, of "Contributions to Vital Statistics."

9307. (*Mr. J. R. Martin.*) Does not great exercise imply also generally the presence of pure air for respiration?—It does not always do so.

9308. It implies out-door occupation, does it not?—Yes; for example, a cabinet-maker; some might question whether that exercise was great exercise, but I have taken pains to consult the workmen themselves, and have had their assistance in making a classification, but the cabinet-maker suffers a great deal from dust and the glass-paper with which he polishes his furniture, and his air is very objectionable. The cooper works in-doors chiefly, though there are out-door coopers of another kind, but he has great exercise, and I have no doubt his air is pretty good. The place is not heated as a rule, but then there are carriers, chair-makers, coach-builders, coach-smiths, engineers, and forgers; these are in-door occupations with great exercise.

9309. (*President.*) If you made this division, dividing all the men who take great exercise in-doors against all the men who take great exercise out of doors, the out-doors would enormously outnumber the in-doors?—Yes.

9310. Generally speaking, fresh air and exercise go together?—Yes; for example, the general mortality per 1,000, in the in-door occupations requiring little exercise, is 9·68, taking the soldiers' ages, and the corresponding mortality in the great exercise is 7·99 per 1,000.

9311. Take the class which have as much exercise as anybody, the out-door railway employes of all kinds, and porters, how do they stand, eliminating accidents?—The actual number of deaths in the

household cavalry was 134. If they had been according to the same mortality as railway employes the number of deaths would have been 99. In the dragoon guards the actual deaths amounted to 704; according to the rate of mortality among railway employes, of that number there would have been only 417. Taking the precise ages in the infantry of the line, the number of deaths was 2,823; the ratio according to the mortality of railway employes would have been 1,205. In the foot guards, the actual deaths were 820, the corresponding number according to the ratio of the railway employes would be 320.

9312. (*Mr. A. S. Stafford.*) Your statements with regard to the mortality of the army are totally independent of the number that are invalided?—Yes.

9313. They simply refer to those who have died in the service?—Yes.

9314. (*President.*) Do you know what length of time railway employes continue to serve?—Yes, I know it precisely, in this way; there is a large friendly society on the Great Western Railway, numbering about 2,000 employes; there is a friendly society on the South Western Railway, numbering about 800; there is one on the Brighton Railway that numbers about 400, and there is also a society on the North Western Railway, but the results are not known for that. On all these societies except the latter one I have been employed professionally during the last eight or nine years in re-organizing them, and one of the elements on which it is necessary to give proper advice is the rate of mortality and sickness which has happened in those societies; the societies all being instituted about 16 or 17 years ago, there is a very large amount of data collected.

9315. Do all the men on the Great Western Railway belong to a friendly society, or is it only a picked number?—Nine-tenths, but it is now made compulsory on all the employes entering the service of the South Western.

9316. (*Sir T. Phillips.*) As the result of these calculations, you would assign as one of the causes of the mortality in the infantry the want of exercise?—Yes; I think that can be clearly proved. That is my own opinion, and I have a document here which, to my mind, will conclusively show that. I was curious, in consequence of the remarks in the blue book by Colonel Tulloch and Dr. Balfour as to the presumed causes that might operate on mortality, to ascertain whether intemperance had much to do with it, and certainly I was prejudiced on the question from hearing every one say that there was a large amount of intemperance in the army, but it brings about other results as to want of the proper sort of exercise being the real cause of the high mortality. I have made an inquiry on the mortality of intemperate lives, and there are some curious results brought out, and it proves to my mind that if intemperance prevails in any large number of people you can detect it in the causes of death. In fact I consider it the best of all tests. I have been very much puzzled in taking the opinions of men of large experience in the army, some assigning one cause and some another, always differing very widely in their personal opinions as to there being intemperance or not; but I arrived at my own conclusion in this way:—Having instituted an inquiry into the mortality among people notably intemperate, I have found that two classes of diseases rank very high, diseases of the nervous system and of the digestive organs.

9317. (*Sir J. Clark.*) You mean intemperance in drink?—Yes; the proportion of deaths from these two causes, diseases of the nervous system and diseases of the digestive organs, at ages 20 and upwards, formed 50 per cent. of the whole mortality of the intemperate lives; but in the general community, that is, in England and Wales, they form a little under 16 per cent., The nosological arrangement of Dr. Farr is taken in both instances and as a consequence of the excess in intemperate lives the ratio of deaths from the

residue of causes is small; the diseases of the respiratory organs form among the intemperate group, only 23 per cent., but in the country generally the respiratory organs show 33 per cent. of all the causes of death; the number of deaths from diseases of the respiratory organs is a little more than double to deaths from diseases of the nervous system and the digestive organs in the country generally; but in the intemperate group the diseases of those organs form more than double those of the respiratory organs—exactly reversing the order. There is a curious series of results in illustration of this. The only group, in fact the only body of men with which a comparison of this kind can be instituted, are the army and the members of a few life offices, as well as the country generally, as to intemperate lives. There is a life office in Germany, the largest in the world, and they publish their experience annually, giving the causes of death. There have been an average of 20,000 lives on their books for the last 20 years. The company was formed in 1829, and grew very rapidly. There are only two other offices that publish their experience, the London offices do not do it; it is the Standard Office in Scotland, formed in 1825, but they have published their experience only since 1846, and the Scottish Widows' Fund Office, formed in 1815. The two medical men who reported are Dr. Christian for the Standard and Dr. Begbie for the Widows' Fund. In England and Wales the deaths from diseases of the nervous system and of the digestive organs, which are the types of intemperate life, is 16 per cent. of the deaths from all causes. In the Gotha Life Office, it is 23 per cent. of all the deaths. In the Standard Life Office it is 30 per cent. In the Scottish Widows' Fund Office 34 per cent.—the intemperate class being 50 per cent. It may not surprise those who are well acquainted with Scottish people a quarter of a century ago, but this shows as you leave the general community, and go into the higher classes of life which are insured in the Gotha Life Office, and as you approach to Scotland you get nearer to an intemperate type of life, and as a natural sequence you have the whole of the diseases of the nervous system and of the digestive organs increasing, and you have those of the respiratory organs decreasing in the same ratio. It appeared to me that if there really be intemperance prevailing in the army, it would be discovered in the results of those figures. I have referred to all ages of 20 and upwards, and consequently the ratios do not apply to the army, who are principally confined to the ages of 20 to 40. I have the ratios of death in the intemperate group for the soldiers' ages, and I have determined corresponding results for England and Wales, for the metropolis, and for the 24 towns which are referred to in the army report, and for the county of Kent, a rural district; and I have further found for each body of the army, the household cavalry, the dragoon guards, the infantry of the line, and the foot guards, a new ratio for the intemperate lives at the soldiers' ages which does not differ widely from the aggregate of all intemperate lives, the soldier's age being the intemperate period of life within which 50 per cent. of notably intemperate people die from these diseases. The ratio then for the whole army varies from 11.1 per cent. from the intemperate type of diseases to about 7 per cent. Whereas in England and Wales the ratio of deaths from those diseases is 13 per cent. at the same period of life, consequently the army is a little more favourable in this respect. In the metropolis the ratio is a little over 11 per cent., in the 24 towns 10 per cent., so that the ratio in the whole army is more favourable than either the metropolis or than England and Wales; in Kent it is higher, being 13 per cent.

9318. (*President.*) The difference is not great between Kent and the others?—No.

9319. You include the towns in Kent?—Yes, the whole; it is not possible to separate them, for the registrar general does not publish a return for the separated districts. In the army it will be found

Francis G. P.
Neison, Esq.

15 July 1857.

Francis G. P.
Neison, Esq.

15 July 1857.

that the deaths from diseases of the respiratory organs are very much augmented. The average of all England and Wales for the soldiers ages is 44 per cent., and the whole deaths attributable to the respiratory organs in the army vary from 54 per cent. in the dragoons to 67 per cent. in the foot guards.

9320. (*Sir T. Phillips.*) Does the 44 per cent. apply to the same ages?—Yes, all of the same ages.

9321. You give the army as varying from 11·1 to 7, what is the meaning of the variation?—It is a different description of force.

9322. What does the 11·1 represent?—Of all the deaths that take place in the army from every assignable cause, 11·1 are due to diseases of the nervous system and digestive organs.

9323. What you call the intemperate type?—Yes; and it is very remarkable that as you descend coming from the most healthy portion of the army to the least healthy, that is, as you approach from the household cavalry, the most healthy, to the least healthy, you have always an augmented proportion of diseases of the chest. For example, in the household cavalry, the deaths from diseases of the lungs of one kind and another are in excess 25 per cent. of what I would call the normal amount of deaths from these causes. But in the dragoon guards, which are next in the order of inferiority of health, the excess from diseases of the lungs has increased to 59 per cent. In the infantry, which are still less healthy than the others, the excess from diseases of the lungs is as much as 116 per cent. Then take the foot guards, which are the least healthy of all, and the increase of deaths, beyond the normal amount that ought to take place from diseases of the respiratory organs, according to the experience of England and Wales, is as much as 173 per cent. But these results are remarkable in showing that intemperance does not prevail to a serious extent, or it would show itself in a development of those diseases arising out of drinking habits. The least healthy branch of the service is that in which the least amount of diseases which I consider a type of intemperate conditions takes place, namely, the foot guards.

9324. (*Sir T. Phillips.*) The most unhealthy portion of the army presents the fewest cases of the intemperate type of diseases, and the largest number of cases of diseases of the respiratory organs?—Yes.

9325. (*President.*) Would you not say this, that the time for the intemperate type of diseases to develop itself has not arrived, from the rapidity with which pulmonary disease acts upon those men?—I should not think that, because you will observe there is an augmented amount of diseases of those organs; but there are two ways of viewing such a result. Whatever may be the remote cause, the immediate cause of death in the army is due to diseases of the respiratory organs; but you will always find, if there be any powerful element acting against the health of any body of men, not only will it show itself in maximum in its own peculiar form, but it will so weaken the constitution that diseases of all the other organs will be *pro ratâ* increased, but not in so intensified a degree. Suppose that 50 deaths take place in the intemperate type from diseases of the nervous system and of the digestive organs, that is half the deaths, from all causes, and 22 deaths only would take place from diseases of the respiratory organs; but although 22 deaths take place out of 100 deaths from all causes, that 22 might be more than the normal number of deaths to the number of people exposed to risk, but relatively not so many as take place from other classes of diseases; and so you will find in the army returns; for example, in the figures now before me, you have an excess over the whole army of 109 per cent. of the deaths from diseases of the respiratory organs, but an excess of diseases of the nervous system of only 50 per cent., that is 1,277 deaths would be the normal amount from diseases of the lungs in the army, if it had been the same as in England and Wales generally, but the actual number was 2,675. In diseases of the nervous system and digestive

organs the normal amount would have been 304, but you had actually 462; consequently you have an absolute increase of deaths in the army from diseases of the nervous system and the digestive organs. In order to see whether the army is intemperate or not, it is only necessary to show how many deaths have taken place from one cause relative to all the others, but it may happen that every one of the causes showed a maximum number of deaths; and this is accounted for by the fact that the one class of diseases, those of the respiratory organs, so weaken and deteriorate the constitution as not only to show a wonderful excess taking place from its own operation, but they so debilitate the constitution that other diseases also get intensified, but not to so great a degree as the diseases of the respiratory organs. It seems to me that this is really an important point, because this class of diseases carries away nearly the whole excess of mortality that has taken place. The actual number of deaths from diseases of the respiratory organs was 2,675 in the army altogether, in the whole ten years; the normal number of deaths would be 1,277, consequently there is an absolute increase from that cause of 1,397 deaths, or 109 per cent. by diseases of the respiratory organs only. The total number of deaths being 4,482, I have stated that of this there is an excess of 1,397 deaths, or 109 per cent. in the number of deaths from diseases of the respiratory organs; but take all other diseases in which the actual deaths was 1,807, the normal number being 1,212, leaving an excess of 595 or 49 per cent. from all other causes. Consequently, while every other cause contributed in the aggregate numerically to an excess of 595 deaths, you have an absolute augmentation from diseases of the respiratory organs of very nearly 1,400.

9326. (*Sir J. Clark.*) You seem to consider diseases of the nervous system and of the digestive organs only as a consequence of intemperance?—No, I do not mean that. If intemperance prevails in any marked degree in any body of men, it will immediately be discovered in the undue proportion of deaths from diseases of the nervous system and digestive organs the type of deaths amongst men notably intemperate, in which the average of 16 per cent. to the deaths from all causes in England and Wales is raised to 50 amongst intemperate men, but other diseases, although prevailing absolutely in an increased ratio, are relatively not increased.

9327. (*President.*) You do not deny that drink may kill a man by pulmonary disease, but you say that in a mass of men of intemperate lives you will always see this large number of deaths attributable to diseases of the digestive and nervous system?—Yes.

9328. Would your rule apply to all ages alike?—I have taken it both ways always—among intemperate lives there is a very large excess of deaths; the diseases of the pulmonary organs were 23 per cent. of the whole, taking all ages, 20 and upwards; but taking the army age that ratio is raised to 27 per cent.; there is no doubt that intemperance does tell upon the lungs as well as upon other parts of the constitution; but the marked way in which it manifests itself is upon the nervous system and the digestive organs.

9329. (*Sir T. Phillips.*) What class of out-door occupation is there in which death from pulmonary disease is largely in excess?—I do not know any out-door occupation in which it is really in excess at all.

9330. (*President.*) In what in-door occupation?—In in-door occupation it is considerably in excess, but not largely, nothing approaching the army; I do not know anything that approaches it; among clerks it is largely increased.

9331. (*Sir T. Phillips.*) With them it is in-door confinement?—Yes.

9332. But take little exercise and in-door occupation, or great exercise and in-door occupation, can you find any class to which either description applies in which the deaths from pulmonary disease approaches the number in the army?—Yes.

9333. To what cause do you attribute the large proportion of deaths in the army from pulmonary disease, to any peculiar influence which operates upon the soldier?—I have a strong conviction of my own, and the returns for the army give a complete solution to it.

9334. (*President.*) Your argument applies entirely to intemperance from drink, not to sexual intemperance or debauchery?—Certainly.

9335. The other cause may remain operative upon the soldier?—Yes; I have not given special attention to that cause. The foot guards are the least healthy of all, and there we find a very remarkable increase of diseases of the respiratory organs. The household cavalry are the most healthy branch of the service. There the increase is comparatively very small, 25 per cent. only, beyond the normal conditions. The dragoon guards stand next in order of health to the household cavalry, the increase being 59 per cent., the infantry of the line being between the dragoon guards and the foot guards, and showing an excess of deaths from diseases of the respiratory organs of 116 per cent., the foot guards being in excess 172 per cent.; and it appears to me that, combining those results with the observations made upon the essential nature of exercise best calculated to promote the healthy condition of the lungs, you have a clear solution of that question as to the army. In the household cavalry the soldier has a large amount of physical exercise which the foot soldier has not, and the thorax is exercised in a more beneficial manner—he has stabling to attend to. The dragoon guards are in the same position with the household cavalry, but as you approach to the infantry there is still less of exercise for the thorax, and it seems to me, as you come from due amount of proper exercise to the want of it, there is a large increase in the diseases in the chest. I do not consider that exercise of the legs would suffice for exercise of the chest.

9336. The cavalry also have horse exercise?—Yes.

9337. (*Sir T. Phillips.*) How do you reconcile that theory of yours with the fact, that with little exercise and in-door occupation, at the period of the soldier's life 30 the expectation of life is nearly as great as with great exercise and out-door occupation?—The comparison would be taken more fairly with out-door occupations and little exercise. If you take the whole of the soldier's period of life the statement given for the individual age of 30 would not apply; I think it would be unfair to consider the soldier's an in-door occupation.

9338. Take little exercise and out-door occupation, there the disparity is by no means considerable?—It is very large; it is six years upon age 30; it is, in fact, 20 per cent., which is not far from the proportion in the household cavalry.

9339. What is the proportion of the diminished value of life between those two classes, little exercise and out-door occupations, and great exercise and out-door occupation, which is due to pulmonary disease?—I should think a very small proportion of it. I consider that those classes are as near as possible to the normal condition as to pulmonary diseases; in fact, pulmonary diseases do not appear in any unusual development, and as to out-door occupations and in-door occupations I think it would be difficult to discover any group whatever in which the pulmonary affections are so much in excess as in the infantry of the line and foot guards. I have found classes in which the tendency approaches close to the household cavalry, but then that branch of the service is comparatively healthy.

9340. (*Sir James Clark.*) What is the difference between the infantry of the line and foot guards?—The excess is 115 per cent. in the infantry of the line, and 172 per cent. in the foot guards.

9341. Have the foot guards much less exercise?—Yes; but I think that the chief comparison should be between the infantry and cavalry regiments as a whole.

9342. (*President.*) Can you account for the difference in the mortality between the dragoon guards and the household cavalry?—No, unless it is attributable to the small number of the household cavalry, or that they are called upon for more exercise.

9343. Can you give the rates of mortality of the sepoy, who does not occupy a barrack, but is hutted?—Yes.

9344. (*Sir T. Phillips.*) How did you ascertain that?—From the returns of the East India Company. Dr. Balfour has also published a very good analysis for one of the presidencies.

9345. Are those reliable tables?—Yes.

9346. (*President.*) They have been published by Colonel Sykes?—Yes. Colonel Sykes got the ages for each regiment for four years, and showed the deaths at all ages, and the causes of death.

9347. The rates of mortality in the sepoy are not in excess of the rates of mortality among the civil native population from which he is recruited?—It is somewhat less.

9348. (*Sir T. Phillips.*) How do you know the rates of mortality among the civil population?—A census was taken for a large number of districts, not for the whole of India, but several were taken by medical boards in India.

9349. For particular localities?—Yes.

9350. (*President.*) Taking them as types of the whole, you have come to the conclusion that the rates of mortality among the native army are rather better than in the population from which it is drawn?—Yes.

9351. The sepoy is hutted, and leads a very temperate life; take the Ghoorka, who is in the same condition, as to being hutted, but who drinks strong drinks, have you any returns to show their comparative mortality?—Yes. One series of returns shows a very great increase, and the other shows a decrease in the Ghoorka, but I should doubt whether the average difference is a very material one; the difference is only about $\frac{2}{10}$ ths per cent. per annum in the deaths.

9352. Could you give the difference between the Madras and the Bengal army?—Yes, for the whole army. I have it for the whole native army, over a period of 20 years, beginning in 1825, and ending in 1844. For the whole of the Bombay army it would be 12.9 per 1,000, and for the Bengal army 17.9 per 1000.

9353. Upon what number of men?—The whole number of men in the three presidencies averaged during the 20 years about 200,000. The official returns contained some errors which were afterwards corrected for Colonel Sykes' paper.

9354. (*Sir T. Phillips.*) Can you account for the great difference between the two?—No, except that the armies are composed of different castes, and live differently; but you will find in Colonel Sykes' paper a good deal of information upon this subject.

9355. Have you examined the subject, so as to be able to confirm Colonel Sykes' conclusions?—As to officers in the army, I have thoroughly gone into the question; and in Madras it is 20 per 1,000.

9356. (*President.*) Do you mean European officers of native regiments?—Yes.

9357. (*Sir T. Phillips.*) Did you mean 20 per 1,000 of Europeans?—Yes.

9358. (*President.*) You mean the officers of native regiments, do you not?—These results refer to the officers of the whole native army of India.

9359. Can you show the rate of mortality among officers in the East India Company's service?—Yes.

9360. Can you compare them with the mortality among the officers in the Queen's regiments in India?—Yes; and the mortality shows a very remarkable difference.

9361. Are you speaking now of European officers in the East India Company's service?—Of both services.

Francis G. P.
Neison, Esq.

15 July 1857.

Francis G. P.
Nelson, Esq.

15 July 1857.

9362. Excluding native officers in the Company's service?—Yes. The data, in regard to the Company's service, are taken from the books in the India House, and are thoroughly reliable. There has been a great improvement recently in the health of the officers in India; but taking the first 47 years of this century, the mortality has been 23 per 1,000 over the term of life you may call the soldier's age; but in more recent years the health of the officers in the army has every much improved.

9363. What is the mortality now?—In the most recent period it is down to 21 per 1,000 and 20 per 1,000. In some districts, between the years 1820 and 1839, it was 20 in 1,000, exactly; whereas, in the Queen's troops, the mortality ranges in one district from about 48 per 1,000 to 51 per 1,000 in another.

9364. May not great objection be taken to that comparison, inasmuch as the officers in the Company's regiments are in very great numbers detached from their corps, and are employed in civil occupations, not living with the troops, and not sharing their hardships?—That may at first sight appear to be so, but I think I can show it is not a real objection. I have gone into the health of the civil service in India for the purposes of their various funds, which require most patient research, as they involve the consideration of enormous sums of money. I need not say that both the civil and military service in India contain a vast number of men, showing great intelligence and capability, for dealing with this very case. Not the least remarkable part of the literature of India is the correspondence that is kept up amongst the officers in relation to the various funds. If you exclude the deaths taking place in the military service, in the field or due to the field, and view only the deaths from natural causes, you will find the mortality is as nearly as possible the same that is taking place in the civil service in India. That you will find in the various reports that I have made on these funds—and being printed, may be easily consulted. The condition of one of the largest funds in India is such as to cause all eyes to be now fixed upon it, and in each of the reports they distinguish for a number of years the deaths that take place in the field from the deaths arising from natural causes. The elements are given to the world for a solution, and if you eliminate those extraordinary or violent causes of death from the natural causes you will find that it reduces the mortality in the military service, in recent years, to as nearly as possible that in the civil service. You must not go back to see what the mortality has been in the whole military service in India since 1760. Generally in the consideration of this subject the mortality of the last century has been mixed up with the mortality in India within recent years, and includes the excessive mortality which took place during the early period of the settlement in India.

9365. In which category have you counted officers belonging to the military service, but attached to the civil service; have you not counted them twice over?—No; those comparisons are made in respect to the individual funds. Take the Bengal civil fund, military officers though doing civil service cannot belong to the civil fund; it is a fund in one sense independent of government, but which it is still compulsory upon a large number of the civil servants to enter. After their death their widows and children receive pensions, consequently members of the civil service only enter into any inquiry respecting the health of the members of that fund; the military are not mixed up in the investigation into the rates of mortality.

9366. But in comparing civil with military, you come to a body of men of whom two out of ten may be with the army, and eight in civil life?—No; you investigate the whole of the military service, and you find that out of the deaths that take place from natural causes, when you eliminate the causes due to active service, the residue shows the normal state of the mor-

talities, consequently you see whether the normal rate of mortality is greater or less than that of the civil service.

9367. How do you account for the large rates of mortality among the Queen's officers in the same country with the Company's officers?—I have so little knowledge of the Queen's service that I cannot answer the question. I simply know the reputed fact, and I am not even responsible for the result.

9368. Have you heard this explanation of it, that the cadet going out to join his regiment in India finds society already formed in a climate and a country whose habits are regulated as precautionary against the dangers of the climate, whereas a Queen's regiment arrives in a body, the officers are unacquainted with the dangers of the climate, and do not believe in the necessity for precaution till they are sick in their beds?—I have no doubt that a good deal of the solution is offered in those remarks, and believe it would place officers of the Queen's service something in the position of officers in the Company's service who went out in the early periods of the settlement, and were unacquainted with the precautions necessary to be taken in that climate when the mortality was high. The army returns, if properly analyzed, would afford a proper answer to the question.

9369. (Sir T. Phillips.) Can you give the mortality amongst the officers in the Queen's service, as distinguished from the men?—Yes, it is very much less; it is about five per cent.

9370. What is the mortality for the whole of the Queen's service?—I have a very elaborate analysis of those results for the average of all the Queen's service for the years 1818 to 1837. It varies in the various presidencies from $7\frac{1}{2}$ per cent. in Bengal to $6\frac{1}{4}$ in Bombay, the average for the whole of India being 73 per 1,000 per annum.

9371. What was the case with the officers, separated from the men, at the same time?—The officers about 50 in 1,000.

9372. (Sir James Clark.) Can you account for the diminished mortality among the officers, in the last few years in India?—I have no doubt that they are more temperate, and understand the precautions demanded by the climate better; I am now investigating that question, having been furnished with the causes of death.

9373. (Sir T. Phillips.) With regard to the Indian army, do you know at all whether the recruiting for the three presidencies is from a different class of men, or, if not, in what way is the great difference in the mortality to be explained?—You will find that in different districts the army is composed of men of different castes, and that there are districts in India in which the mortality is under one per cent.

9374. Bombay is the largest, from what source is that army recruited?—It is very various. I believe they are, to a great extent, Hindoos.

9375. Take Madras?—The most favourable district in Madras is Coorg, which has a large proportion of troops, and it is not above eight in 1,000.

9376. (President.) Speaking of the Indian army, you have stated that the rates of mortality are not higher than among the native population, do the native populations of the three presidencies show some variations?—I cannot speak of the whole, but those I can speak to differ very little indeed, and there is still another consideration. The service among those troops includes active service, which I believe has been very fluctuating in its results. From 1842 to 1844 in Bombay there was a very large increase of mortality. If those three years were taken, you would find an increase in the Scinde district of two or nearly three times that in the rest of the presidency.

9377. If you could eliminate the troops on service, and the troops quartered in Scinde in very unhealthy districts, the difference in the mortality would be very much reduced?—Yes; if you compared the residue of the Bombay presidency, that is, the mortality amongst the troops that had not been in Scinde in the war, you would find that the health was exceedingly good.

9378. (*Sir T. Phillips.*) Do the actual deaths include the deaths from violence?—Yes.

9379. You cannot deal with the proportionate disparity which may be attributable to loss in the field?—Not at this moment, but that information could be easily given.

9380. Have you the means of showing whether there is a great disparity between the value of civil life in other European countries, and the value of the soldier's life?—Yes.

9381. Is that a subject you have paid attention to?—Yes.

9382. What is the result?—I think I can prove that in most European nations there is very little difference in the mortality as to the native civil population; very exact returns, more so than for this country, exist for the whole of Sweden, for upwards of a century, and there is very little variation in the value of life in the whole of that period.

9383. A variation between what?—From year to year in the rates of mortality; there are documents in the registrar general's reports on that very point, showing that in this country, since the time to which the data employed by Dr. Price, beginning in 1735, there can have been very little difference in the mortality among the whole population of this country. The general opinion has been formed on the results of an error in the use of the data employed by Dr. Price, but which Dr. Farr has rectified, showing that if Dr. Price had employed proper methods in his investigation, the results would have agreed as nearly as possible with those deduced by Dr. Farr for a period of seven years, of which 1841 was the centre in the same district. There is

the Carlisle table, which refers also to the middle of the last century, for another district of England, and the value of life according to that is as nearly as possible the same as the results now deduced from the registrar general's returns. The same thing will be found in other countries. In the blue book of the War Office, of 1853, will be found the mortality for the various armies in different parts of Europe and in America; and in those various armies, though showing different rates of mortality, they are all in excess of the ordinary population.

9384. (*President.*) In point of fact the Indian native army is the only one you know whose rates of mortality are not higher than the population from which they are drawn?—Yes. But I should doubt very much whether the returns referred to by Colonel Tulloch in regard to foreign countries have been investigated with the same scrutiny as his own.

9385. (*Sir T. Phillips.*) Does the disparity in any other European army between the value of civil life and the soldier's life at all equal the disparity in the case of our own army?—I should doubt whether it does.

9386. (*Sir James Clark.*) Has not the value of life increased since the time of Price's tables and the Carlisle tables?—No, I think Dr. Farr has conclusively shown that it has not done so.

9387. (*President.*) In the Prussian army the rate of mortality per 1,000 is 13.1, in the United States army it is 18.8, and in the French army it is 19?—I believe so, according to official documents.

9388. (*Sir T. Phillips.*) The value of life in France is rather less than in England?—Yes.

9389. (*President.*) Can you give the Commissioners the mortality among the *Times* printers?—No; but I will endeavour to obtain it.

Francis G. P. Neison, Esq.

15 July 1857.

The witness withdrew.

Adjourned to Friday next at One o'clock.

Friday, 17th July 1857.

PRESENT:

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Dr. ANDREW SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

Dr. ANDREW SMITH, further examined.

9390. (*President.*) Have you got a copy of the general instructions for the guidance of medical officers, the heads of staff, and others, in charge of departments?—Yes, I have. (*The same was handed in.*)

9391. Do you wish to offer some observations in reference to questions, which have on different occasions been put to you, as to confidential reports?—Yes, in consequence of what happened at my last examination here; I stated that the usual practice was, when a confidential report, upon an officer, arrived from a foreign station, and I discovered anything particular in it that warranted me in interfering, in reference to what was unfavourable, to write a letter to the officer, forwarding it through the principal medical officer, with a view to get the officer's explanation. That I did not state the words of the report to him, but that I did do so in the event of his professing not to know what he had been reported for. I then give him the exact words, and I will mention a case at the present moment, which shows the course that I pursue; the case is still under consideration. I wrote to the officer as I have said I write, and he professed not to know what

the charge was that had been made against him; I then furnished him with the very words of the writer of the report. My principal reason for wishing to speak on this point is, that I was referred on my former examinations to some answer that I had given on Mr. Stafford's committee, and I inferred, from an observation that was made, that it was thought that answer was inconsistent with the answers that I gave on that occasion. Now I hold that they are perfectly consistent, inasmuch as I only gave a partial statement; all the necessary questions not having been put to me. On Mr. Stafford's committee the question was not put to me, whether I gave the purport of the report to the officer; it was, whether I communicated the report to the officer, and by that I understood, whether I communicated the literal words of the report. The questions to which I refer, and to which my attention was called, are 343 and 344, and they run thus:—"Do you ever communicate to the individual implicated, the confidential reports made to you?—No, I do not, as a rule." Which I hold to be quite consistent with what I said on my last examination. The next question is, "In

Dr. Andrew Smith.

17 July 1857

Dr. Andrew
Smith.

17 July 1857.

"short, you make it a rule not to communicate them?"
"—I make it a rule not to communicate them; I do
"it only as an exception." I hold, that another
question is wanting, namely: Do you communicate
the purport of a confidential report: if that question
had been asked me, I should have said yes, but that
question was not asked, and, therefore, I again say,
that I hold the one is perfectly consistent with the
other.

9392. Then the Commissioners are to understand
that the practice of the department is when a confi-
dential report is made against an officer to communi-
cate to him the fact that he has been reported against,
but that the actual words of the charge are not com-
municated to him unless he expresses his ignorance of
the charge, and in that case the very words are sent
to him?—Yes.

9393. (*Sir T. Phillips.*) But in any case the
substance is communicated to him?—Yes; with
reference to my answer to that, I may say, that
during the time I have been at the head of the army
medical department, a period of 7 years, I do not
think I have in two instances received letters from
officers to say that they did not know what they were
charged with. They all knew, but some choose to
carry on a long correspondence, and say that they do
not know; when they require me to state what
the actual words were, I always do it, either verbally
or in writing.

9394. I believe you also wish to offer some explana-
tion with reference to questions that were put to Mr.
Taylor, he having stated in evidence before the Com-
mission on the 10th instant, that he had been specially
recommended for promotion while serving in the
Crimea?—Yes, Mr. Taylor gave it to be understood,
in his answer to one of the questions, that he
complained that he had not been promoted, although
he had been specially recommended for promotion; and
he further added, that I had to a certain extent
recognized that, when he spoke to me in my office on the
subject of his having been recommended. I am sorry
to say that I must take exception altogether to that
statement, for he never was recommended for promo-
tion to the rank of inspector-general by any person
who communicated that to me. He applied six months
after he had been made deputy inspector-general, and
addressed a letter to General Simpson, and asked to
be promoted in the Crimea; he sent it to Sir John
Hall to forward and Sir John did forward it to
General Simpson, and reported favourably in refer-
ence to Mr. Taylor, which no doubt he deserved.
The application reached General Simpson, but he
never sent it home to this country recommending
him for promotion. I have ascertained that; he
sent it with a number of other documents at the end
of the war, for the information of the Commander-
in-Chief, when referring to medical officers who he
thought had done good service during the war; and
one of those documents was Mr. Taylor's application
to him for promotion, but he does not say a word in
favour of claims to promotion. There were some-
where about 40 or 50 officers reported upon in
that document, and I distinctly say that Mr. Taylor
was not recommended to any authority in this country
for promotion to the rank of inspector-general as he
stated.

9395. Is there any other point upon which you wish
to give any information to the Commissioners as to any
evidence that has been given before them?—Yes, I
should like to refer to a number of cases that have
been brought forward by medical officers as evidence
of mal-administration in my department. Dr. Beatson
on being examined brought forward as evidence that
a staff-surgeon of the second class on half-pay had not
been brought in fairly. He commenced by stating that
No. 3 on the list of half-pay, the third senior, was
brought in first. With reference to that statement I
have simply to say that the senior on half pay was
Mr. Brush, who was then sick, and who is still sick.
The next was Mr. Maclise, who from mental affection
was unfit at that time, and is still unfit. The next

was Mr. Braybrook, whom I took first, though he
stood third on the list.

9396. Did he not stand first on the list of those who
were efficient?—Yes, but third on the list of the men
on half-pay; that is the mistake. Persons who
complain do not know the circumstances of each case,
they assume that the mere number must be right,
whereas in this case Mr. Braybrook was the first
officer efficient. Then there was another case brought
forward. It had reference to three officers who were
brought in before they should have been. These
were three officers who were in the Land Transport
Corps in the Crimea, and when the Government
resolved to re-organise that corps, and call it the
military train, medical officers were to be provided for
it, and those officers to whom I have alluded, and who
had been placed on half pay, Colonel Macmurdo,
the officer in command, naturally enough applied to
have restored to the service, and I thought it my duty
to comply with his request for the good of the service,
therefore those three officers do not appear restored
exactly on the list as they stood.

9397. Why was it for the good of the service?—
Because they were returned to a service with which
they were acquainted. It is the practice throughout
the whole service to do that, unless it is productive of
very gross injustice to individuals. There was another
officer he complained of as having been brought in
early, who stood low down on the list, Dr. Fyffe.

9398. How did those officers if they were wanted in
the military train come to be reduced?—Great num-
bers were reduced in the first instance before they
came to consider what was to be done. The reduction
had been carried too far, and when they re-organised
the corps and made it a military train, they applied
for the same men to be restored to the corps. As
to the other officer of the name of Fyffe. A good
deal of correspondence took place at one time as to
the propriety of trying the effect of the Bath waters.
The opinion upon the subject was very divided;
some were adverse to it, and many were in favour
of it. I anticipated no good results from it, but as
opinions were divided I thought it necessary to have
one of the very best officers that I could find,
who would be very particular in observing the results,
and I therefore felt no hesitation whatever in recom-
mending Dr. Fyffe to be restored for that special duty.

9399. Had he had any previous acquaintance with
the subject of mineral waters?—No; I do not know
that he had, nor do I know that I could have found
anyone who had. He was a man of a certain stamp,
with great powers of observation, very industrious,
and zealous, and anxious to perform well any duty that
he might be appointed to; therefore, I felt that he
was a man I could trust, in order to procure true
statements, and not be told that the Bath waters were
useless or were valuable, unless they were really the
one or the other, I thought this officer specially
qualified for that duty. Then, with reference to the
remainder, who have been brought to full-pay they
have all been brought from half-pay according to their
standing except two. Mr. Crerar was not brought
back, or rather he was brought back after he ought
to have been, and the reason of that was, that he
on being put on half-pay proceeded to Halifax to
reside, and he did not wish to come to this country
until he could be on full-pay. When there was only
one above him, I communicated to him that he
must instantly return to this country, if he wanted
to succeed in his proper turn. He did not return, and
two vacancies occurred in the meantime, therefore I
could not appoint him, being at Halifax, so I was forced
to take those men who were available, and recommend
them at once, and in that way two went over his head;
but that was his own fault, not mine. Then there is
the other that has not been restored to full pay, a staff
surgeon of the second class, of the name of Lewis; he
is residing in Canada at his own request, and is not
anxious to be brought to full-pay until all those of his
grade are brought. As long as he asks to remain
on half-pay I do not force him, so long as there are

*Dr. Andrew
Smith.*

17 July 1857.

any others I can bring in. That is all that I have to say as to those cases. Then, either Mr. Beatson or Mr. Taylor brought forward some other cases as evidence of unfairness on my part. The first case was that of Mr. Tupper; he was promoted to the 66th regiment, in Canada, not, as Mr. Taylor stated, on account of a death vacancy, but on account of the retirement of Mr. Montgomery, who was found unfit for the service, and was placed on half pay; I then had to recommend an officer to succeed him, and at that time when the vacancy arose there were five assistant-surgeons in the whole service who were senior to Mr. Tupper; three were in India, and were therefore not eligible to be promoted in this country, and two others, one at home, and one at Nova Scotia. The 60th regiment had for nearly 18 months, so far as regarded the medical department, been in a state of disorganization, in consequence of the inefficiency of Mr. Montgomery, and I felt it to be my duty to select an officer who I believed possessed the ability, zeal, and decision of character that was required to restore the medical organization of the corps, and therefore, without any hesitation, I recommended one that I knew was able to do it, namely, Dr. Tupper, and I passed over the two others, neither of whom I could have taken.

9400. Were they both men who were unequal to the charge?—Yes, the one was perfectly unequal to it, and the other was not a man who I considered would do justice to the corps though not an inferior man, but he had not the activity and zeal which I thought were necessary for the corps.

9401. In that case you exercised selection?—Yes, and I felt less reluctance to do so, as I saw that in a short time I could promote both of those officers to positions that would not require the same amount of energy and zeal, and consequently I recommended Mr. Tupper, which I considered I was bound to do; I think I should have done injustice to the service if I had not done so.

9402. In that case you acted as you would have done in the senior ranks for the good of the service; you took the best man, the one most capable of doing the duties, and put him over the head of men whose proficiency you doubted?—Yes.

9403. And you considered that the good of the service required that course to be taken?—Yes.

9404. In the promotion from the rank of assistant-surgeon to surgeon where the good of the service requires it you would depart from the rule of seniority?—Yes, in the promotion from assistant surgeon to surgeon seniority is observed unless there is any necessity for passing over the senior.

9405. In the case of these two men that were passed over, but who were equal to other posts afterwards, did you antedate their commissions so as to preserve to them their original seniority?—I cannot answer that question, but I think not.

9406. Are you allowed to antedate commissions?—Great objections are raised to it and I am afraid to try it.

9407. (*Mr. J. R. Martin.*) Did you take an early opportunity of promoting those two officers notwithstanding?—I think a month afterwards, speaking from recollection; I was aware that there would be opportunities of promoting them.

9408. (*President.*) I take this opportunity of asking you a question which arises on this case, which is this:—How do you account for the difference between the vacancies which occur on foreign stations, and the death vacancies which occur through promotion, the distance from which you bring the men, the delay to which a regiment is subject, and the cost to the country being the same in either case?—I cannot account for it except in this way, that it was the practice of the service when I came to the medical board, and I continued it, having considered it fair that death vacancies should be filled up on the spot for the reasons I have stated before; there may be a severe epidemic, such as yellow fever in the West Indies, and the surgeon may die, and the assistant-surgeon

during all that time may have been exposed to the same danger and the same amount of labour that the surgeon had, and if he were not to get the vacancy that arose, but another man perhaps from England or the Cape who was senior to him, but who had never seen any serious disease, he would naturally feel that he had not benefited from his exertions in the West Indies.

9409. It is like the case of a man employed in war who thinks that he has a better right to a vacancy than a senior who was not engaged with the army in the field?—Yes.

9410. You mentioned the case of Gibraltar, which was separated from the rest of the Mediterranean command, on account of the fever that prevailed there, and that you gave the vacancies to the men at Gibraltar, they having been exposed to the danger, and having a right to benefit by the vacancies; in the same way it was the ill luck of the men at Malta, who were not engaged at Gibraltar, and having the same means of distinguishing themselves?—Yes, I consider that the danger to which an officer is exposed during a severe epidemic in the West Indies is greater than the danger that a man is exposed to in war.

9411. Still the proportion of medical officers who died at Scutari was greater than those who died in unhealthy colonies?—I do not reckon Scutari in the category of war. That was a large hospital, with a large number of patients, and at a great distance.

9412. If a vacancy took place at Scutari then, an officer on the spot got the promotion. Would you or not think that the officers who were in Canada at the time had a claim upon you, as they had not had the same opportunity of distinguishing themselves as if they had been at Scutari?—They would not have a claim upon me, as it is understood that death vacancies are given on the station.

9413. Still, I think, you stated that in the case of the death vacancies that took place, you had given to officers away from the scene of action some promotion, in recompence for their not having had an opportunity of serving in the Crimea?—No, I am not aware of having stated that. I stated, that when officers came home who had been absent, and when an additional force of medical officers was to be sent out to the Crimea, I sent them, and that when they could be promoted, I thought they ought to take their standing in the grade to which they were raised, according to the length of their general service. It is a matter of opinion. I think it is just, others may think that it is not just. And now, when on this subject, I should like to advert to a memorandum that I have here. It has been urged, that the artillery and engineers' seniority corps do gain advantages for being sent to war, though they may be junior officers to others serving at a distance, who were not available for war. I find that that is not the case. If a captain of engineers was sent to the Crimea, he being 10 below a captain in New Zealand, and a death vacancy occurred in the Crimea, in consequence of the death of a senior officer serving in the Crimea, the captain in the Crimea would not get the promotion. Our officers claim to have promotion, and they get it, therefore they have rather an advantage than otherwise.

9414. You must recollect that in your upper ranks you do not affect to have seniority, it is selection?—Selection, as I have stated, is put forth to be the rule, but then I have found it is so impossible to satisfy myself that I would not do injustice in observing the rule, that I have generally taken upon myself to observe seniority if possible. The rule is selection, from the circumstance that Sir James Macgregor himself told me, when I came into the office, that it was the rule, and he also stated before the Military Commission that sat in 1840, that that was the rule.

9415. The practical result is this—that whereas you select in the rank of assistant-surgeon for the good of the service, although professedly that rank is governed by seniority, you take seniority in the upper ranks as

Dr. Andrew
Smith.

17 July 1857.

your rule in selection, because you find it so difficult to place one man over another, so that in the rank which is nominally promoted by selection, the promotion is by seniority, and in the rank which is promoted nominally by seniority, the promotion is by selection?—In some cases. In the case of the assistant-surgeon referred to, I wanted a special man for a special duty, and I felt that the two men who were senior to him were not men calculated to do justice to the public, therefore I took him. With regard to selection of senior officers, I would not take an officer of the senior grade, a deputy-inspector, and recommend him to be made an inspector-general, if I thought he was not equal to the duties; but if I was satisfied that he was equal to the duties, I would go on the ground of seniority, and recommend him.

9416. (*Sir T. Phillips.*) With regard to promotion in a colony, or in any station by reason of a death vacancy, you say that you found it to be the practice in the office, and you regarded it as a sound practice, as it affords the opportunity of rewarding a man who has been exposed to special danger; but supposing him not to be exposed to any special danger, what then?—I found even in that case it to be the practice.

9417. But it does not become necessarily a reward of special service, but the result of accident?—But it was originally instituted as a reward, yet instances have occurred in which it was not a reward.

9418. In order to be a reward it must be a selection by reason of circumstances having actually occurred, not because they might have occurred?—So it was when the regulation was established.

9419. (*Mr. J. R. Martin.*) Would it not be more fair, as all medical officers take their chance both of epidemics and of actual warfare, that they should also share the promotion—that a man who had been exposed to epidemics in the West Indies should be promoted there in case of accident, and that a man on the field should also be promoted there?—That is actually what takes place.

9420. (*President.*) It is what takes place when the vacancy is a death vacancy?—Yes.

9421. But this may occur in a place where there is yellow fever—that there may be no death vacancy, but the promotion then is given to the senior in the army list?—Yes.

9422. On the other hand, if it were a death vacancy, it would go to the officer on the spot?—Yes, that is a matter of chance. I found that to be the rule, and I have not thought I was justified in deviating from it. The next case was the case of Mr. Murphy. When the 80th regiment was ordered home from India, or rather it was after the regiment had probably embarked, I was required to provide for service in the Crimea, three staff surgeons of the first class. I ascertained that Mr. Taylor was close to the shores of this country, and as I had found him a very good officer during the Burmese campaign, when I appointed him principal medical officer of Her Majesty's troops, and from time to time received excellent reports from him, which kept me well aware of what had taken place, I selected him for one of those three staff surgeons. At that time, in March 1854, I was over-pressed with work, and the clerk in my office who makes out the list of the seniors who are entitled to promotion brought it to me, there being nine surgeons required exclusive of the three staff surgeons, and placed the list before me, having omitted in that list Mr. Murphy's name. I had no time to scrutinize the list, as I should have done had I had the ordinary time as in peace, but immediately said, "Yes, recommend those men," and they were all recommended and gazetted. A few days afterwards, when I had a little time to look to what I had done, I discovered that Mr. Murphy, a man whom I never had thought of passing over, had accidentally been passed over, from not having been introduced into that list. I immediately ordered that he should be the first man to be recommended for promotion, and in about a month afterwards an occasion arose, and Mr. Murphy's name was sent in at once, and he was promoted; so that all that can be

said in that case is, that it was a simple oversight during a period of unprecedented pressure.

9423. (*President.*) You would not have done that if you had been aware that his name was there?—Most decidedly not. He was one of the most experienced of the whole number. His name is in a list that I am now getting up to have, if possible, certain commissions antedated. I do not know whether the Commander-in-Chief will accede to it, as it will involve the antedating of a great number. If he does accede to it, it will be a precedent that will keep up a constant turmoil in the department, for there are many who could not be promoted in consequence of not being available. Nobody can conceive the trouble and difficulties that the slightest movement of this kind creates. I shall receive, perhaps, 20 letters as to a point of that kind. I am afraid to try to do it, although it would be only an act of justice to do it.

9424. (*Sir T. Phillips.*) In that case it would be simply the correction of an accidental miscarriage of your own?—Yes; but every one else would be ready to say, if that was to be done merely because officers were not available, that their commissions should be antedated too. The third case does not come within my time, but, notwithstanding, I am equally prepared to defend the proceeding of Sir James Macgregor as if it had been my own; it is the case of Mr. Matthews. Surgeon Charlton, of the 2nd battalion of the 67th regiment, was examined by a board of officers at Gibraltar, on the 15th March 1849, and recommended leave to England for the benefit of his health. He was examined at this office, and granted four months' leave, which was extended till his death, which occurred on the 20th August, 1849. On the 29th August Assistant Staff Surgeon Matthew was recommended for the surgeoncy of the 67th, vice Charlton deceased. Mr. Matthew was, at the time, the senior assistant-surgeon serving at Gibraltar, and, by desire of the Commander-in-Chief, he had been specially recorded for promotion on the recommendation of Sir Robert Wilson for his services at Gibraltar and at Tangiers, in attendance on the Sultan's nephew. I must say that when such recommendations as these come for special services, it is the practice to consider them, if not imperative, as next to imperative.

9425. In the rank of assistant-surgeon?—In any rank. The next is the case of Dr. Reid, and his case was this:—Staff surgeon 2nd-class Stewart, one of the medical staff of the Mauritius command, was examined by a board, at Port Louis, on the 27th October 1848, and recommended to be sent to England for the benefit of his health. On his passage home, before reaching the Cape, he died (on 19th November 1848), and the senior assistant-surgeon in the Mauritius, viz., Staff Assistant-Surgeon Reid, was, by the rule of the service, entitled to the vacancy; but as the staff at the Cape was then being reduced Mr. Stewart's vacancy was allowed to lapse, and the first vacancy which occurred at the Cape after the reductions had been effected, was given to the Mauritius command.

9426. There were two seniors to him, it was stated, in Ceylon?—Ceylon has nothing to do with the Cape and Mauritius command.

9427. If you recollect, Dr. Beatson said that it had in his time, as he obtained his promotion, being in Ceylon, on account of a vacancy that took place in the Mauritius?—I cannot fully explain Dr. Beatson's case; I was not head of the department when he was promoted.

9428. But they are acts of selection for the good of the service in the rank where promotion is governed by seniority?—Dr. Reid and Mr. Stewart were serving together in the Mauritius. Mr. Stewart was taken sick, and it was found necessary to send him home. He died on his passage before coming home, and therefore until his arrival in this country he belonged to the Mauritius staff. Dr. Reid was entitled to the death vacancy, being the senior in the command at that time. The government had decided that there were not to be the same number of staff surgeons of the second class at the Cape as hitherto. A reduction

was to be made, and therefore they would not sanction the promotion of Dr. Reid, but decided that his promotion should be deferred till the next vacancy, which occurred at the Cape in the 91st regiment; and Dr. Reid, who ought to have got the death vacancy in consequence of Mr. Stewart's death, was promoted to the 91st regiment, and sent to the Cape.

9429. He was the senior?—Yes. The next case is that of Dr. Beatson himself, who stated that he was promoted from Ceylon to the Isle of France. His case was this:—Staff assistant-surgeon Beatson embarked for Ceylon on 23rd May 1839; was promoted to be staff surgeon 2nd class, on 28th August 1846. On 10th October 1850 he was warned for duty in Hongkong, but on the 12th the order was cancelled, and the principal medical officer was told to send him home the first officer on duty. He had been too long a time in the island, having had an undue advantage over other medical officers, who were all anxious to go to Ceylon. He continued in Ceylon till he exchanged into the 51st in India, on the 31st January 1851, but before the appointment had reached Ceylon he had left for England with invalids. He arrived at home 23rd May 1851. These are all the cases that have been brought forward as evidence of maladministration, and I have nothing further to say.

9430. There was a question with regard to Mr. Wood and Mr. Paynter?—Yes.

9431. Those cases I think you explained before?—Yes. I kept them on temporary full-pay, and they were aware of that, from a letter written by me to say, that as soon as the special duties were concluded in which they were engaged, they would be placed on half-pay.

9432. Were they duties requiring any special qualification?—Yes; one was employed at Portsmouth landing the sick, where he had been for eight or nine months; the other Mr. Paynter was at Aldershot, where a good deal of duty was required to be performed of a special nature in the formation of the camp, from which place I did not think it desirable to take him away for a few months, in order to put a man in his place who would have to learn the duties, which the other had already learned.

9433. Did you not afterwards move those two officers to York and to Edinburgh?—Yes; because accidental circumstances arose, but still they were for temporary duty; the same had before induced me to place one at Chatham for a month to assist the principal medical officer, instead of bringing a man from half-pay for a month, and then put him back to half-pay, and therefore I kept them on, with the intention, as soon as there were no particular duties for them to perform, to put them upon half-pay.

9434. I understand from you that both those officers had special duties to perform, and that their special capacity enabled them to execute them better than other officers?—Not capacity, but local knowledge.

9435. They might have had local knowledge at Aldershot and at Portsmouth, but they had none at York or Edinburgh when they were moved to those places?—There they went as fresh men. I should have put them upon half-pay, but at that time there was every prospect that the two officers who had been taken away, one from Edinburgh and one from Leeds, would very soon be back from China, when I should be compelled to find places for them. My intention was to send them back, one to Edinburgh and the other to Leeds, and to put Mr. Wood and Mr. Paynter on half-pay. Had I acted otherwise I should have had at once to put Mr. Paynter and Mr. Wood on half-pay, and bring two men in from some part of the country to full-pay, and keep them there for three or four months till those came home who were senior to them, and then put them back upon half-pay; I consider that would have been no advantage to a medical officer, taking into account the trouble and the moving about that he would have been subject to.

9436. There were officers, were there not, who were reduced who might have been kept on?—No, not permanently. The officers who were reduced are all now in one position. Mr. Wood and Mr. Paynter were only kept on for temporary duty, and not as of the permanent staff. As regards the case of Mr. Ligertwood, it was asserted by somebody that he was merely promoted for having done duty in the principal medical officer's office. At that time I was not able to state his case, but I find now that Mr. Ligertwood was one of those officers who volunteered under the pressure to leave his corps in this country and go to serve in the Crimea, though his corps was not there. He embarked on the 7th April 1854; he got to Scutari on the 24th April 1854; he was attached to the 2nd division from the 25th April 1854 till the 25th of August 1855, which was nearly 16 months; and he was then, on account of his efficiency as an office man, taken by Sir John Hall into his office, and was employed in it till the termination of the war; therefore a great portion of the time that Mr. Ligertwood was in the East, he was employed in actual duties in the field.

9437. At any rate that was a case with which you had nothing to do, it was under the sanction of the Commander-in-Chief there?—Upon the recommendation of Sir John Hall. There is another case that I wish to refer to, that of Staff-Surgeon Stone, who was serving in the West Indies. He was junior to some of those who were on half-pay, and I mentioned that circumstance to Lord Panmure at the time. He had been sent to the West Indies to fill a vacancy, and had been there for six or eight months, and I told Lord Panmure that he did not come legally among the number for full-pay, when he said, as he is there, let him remain, I will be responsible for that. Then also it has been stated that I had recalled to full-pay Deputy-Inspector Hadaway, and Deputy-Inspector McDonald, while there was a senior deputy-inspector on half-pay. Quite true I selected in that case, and I was prepared to show my reasons to the Commander-in-Chief at once why I selected, but I should not like to say here why I passed one man over and took two juniors. I wanted a station suitable to him and that station has now come; I did not consider the stations to which the other two men were sent were stations to send him to.

9438. In that case it was a selection on your part with a view to the good of the service?—Yes; I do not mean to say that I do not use selection in such cases, I always do when I see that the interests of the service require it.

9439. That would account, would it not, for the inequality in the dates of the promotions of the assistant-surgeons to the rank of second-class staff surgeons and regimental surgeons?—I do not think that there is any inequality, I think that seniority has been carried out almost without exception.

9440. Taking them out from the army list, the summary is this: that there is one officer above five and under six years' service who has got his promotion;—six, above six and under seven;—eighteen, above seven and under eight;—seven, above eight and under nine;—one, above nine and under ten;—that shows a very great variety?—Yes. The officer over five but under six years got his promotion because there were no seniors to him available at the time the senior on the spot had been advanced.

9441. They entered the service at different periods. I have taken the number of years' service which each had gone through when he got his promotion?—I had exhausted all those above that service.

9442. There are 14 assistant-surgeons, of whom 10 have had over ten years' service, four have had over eleven years' service, and still are assistant-surgeons?—They are eight in India, three in New Zealand, two at the Cape, and one in England, who refused promotion.

9443. Then I say that practically it does not operate to produce promotion by seniority?—Promotion does not take place by seniority in every case, as

Dr. Andrew Smith.

17 July 1857.

*Dr. Andrew
Smith.*

17 July 1857.

in the case of a death vacancy, there if a man is three years junior to fifty, he still gets the vacancy.

9444. Not always. I think you mentioned an instance at the Cape, where an officer had served for the necessary length of time?—In a time of peace I cannot recommend a man for promotion who has not served the fixed period.

9445. I think you mentioned a case at the Cape when an officer stood next, but was a very young man, and although he had served the necessary time by regulation, you took somebody from another station?—I do not recollect the case, but I do not say that it could not be done, because there are no fixed rules to bind. The object is to do justice to the department and the service. If in the case of an assistant-surgeon of six years' service I found that the assistant-surgeons generally were men of 12 or 14 years' service, I should not think it an act of justice to give it to an assistant-surgeon of only six years' service; I should take an officer who was older in the service, and I should consider I was doing justice.

9446. You referred to the small hospital which has been established at Bath for the use of the Bath waters, have you had yet sufficient experience to be able to speak of the results?—No, I cannot say that we have; all I can say is, that hitherto it has not answered, but I am not prepared to say that that will be my ultimate opinion.

9447. For what diseases are the men treated there?—Rheumatism, scrofula, secondary syphilis, and six or eight other diseases.

9448. There is no carbonic acid gas in the Bath waters or in any waters in England in any quantity?—Yes; the waters at Buxton contain carbonic acid gas.

9449. But there is no large proportion as there is in the waters at Aix-la-Chapelle?—No.

9450. Therefore you do not anticipate the same effects from any waters in England as from any foreign waters?—I do not. I do not anticipate any real good results from the Bath waters, as men who profess to suffer from chronic rheumatism persist in doing so, their object being to get out of the service; they are malingerers, and in that sense they will not acknowledge that they derive benefit, and you cannot say that they do derive any.

9451. In short, a man who wants his discharge for chronic rheumatism you may set down as incurable?—Yes.

9452. Would these waters be of any value for gunshot wounds?—I do not think so; it is said that they are valuable for contractions and all such complaints, but I suspect that it is mere assertion.

9453. As far as you have gone you have no reason to be hopeful as to the results of the experiment?—No. A number of men who have been there finding it rather irksome to be subject to the discipline that they are under, have professed that they were quite well, and have been sent back to their corps, but on their return they were instantly in hospital again.

9454. You mentioned the other day that you thought the medical officers at Scutari who had been exposed to great danger had not been fairly treated, as compared with officers in the front, in the distribution of honours?—Yes. I think that they have not.

9455. Is there any rule which would debar them from receiving honours, or was it merely that being out of sight and out of mind they were not recommended by Sir John Hall?—No, it was not on that account. The statutes of the Bath require that an officer to be eligible for a C.B. must have "been marked by the special mention of his name in the *London Gazette*."

9456. Did they get the same promotion?—Yes.

9457. It is stated that there is no man alive who was promoted at Scutari—is that so?—No, there are several.

9458. Of course there were promotions in the front without death vacancies—promotions of staff officers for distinction in the field who got a step in rank?—Very few of that description. I know there has been

a complaint, and it was made at the Sebastopol committee, against me for sending out men to the Crimea who were senior to those of certain ranks in the Crimea. I hold that I did nothing but justice there, and I could not have done otherwise, or I should have done gross injustice. A number of regiments were recalled from Canada to form a division to go to the field, and the medical staff that existed in Canada up to that time was not required afterwards. Those medical officers were called home, and when they came home I considered it my duty to send them on to share with others the duty in the Crimea, with the fresh troops that came from Canada, and were proceeding to the Crimea to form fresh divisions. I thought it my duty to form a medical staff of the men in this country, and to send them along with them, so as not to give everything to the men who were out in the East, and I hold that that was positive justice. A charge has been brought against me that I acted with injustice towards the men out there, because I did not recommend the staff surgeons out there to be made deputy inspectors to form the staff for the new division.

9459. There was one case that you did not mention, the case of Mr. Anderson, who alleged that he was not sick at the time he was passed over?—But he was sick, or the returns are false, that is all I can say about it. Mr. Anderson has no complaint to make; he was passed over, and when he was promoted I succeeded in getting the Minister for War to give his sanction that those who were passed over on account of sickness should have their commissions antedated when they were able to be actively employed, and his, I think, was the very first case.

9460. Could you give to the Commissioners a copy of the statistics of the disease and mortality in the Crimea?—That has not advanced sufficiently to enable me to do that.

9461. Is not the first part complete?—No. There are five parts going on simultaneously, but there is no part complete; there are different persons compiling the different parts.

9462. Will they throw much light upon the history of the disease and mortality in the Crimea?—I should hope so.

9463. Had any instructions been issued with regard to the troops going out to India or to China, with regard to the premonitory symptoms of diarrhoea and cholera, or had you made any change in the system, or are the men left to report themselves?—The men are never left to report themselves. Where cholera exists non-commissioned officers are stationed close to the privies in order to watch the men, for they will not report themselves, and if the non-commissioned officers see a man go more than once in a day they take him to the doctor.

9464. There is no preventive examination, is there, by the doctor?—According to the cholera regulations which were issued when first the disease appeared in this country, in a pamphlet containing about 60 pages, it was required that they should inspect daily the men on parade. At that time a good many of the most judicious regimental surgeons wrote to say that they did not think it was a wise plan as it frightened the men, and that they should only occasionally go on parade as if by accident, and go down the lines with the colonel, so that they might not be supposed to be looking whether a man had cholera in his face or not, and in consequence it was given up, unless when the disease had appeared in a regiment, then it was carried out.

9465. (*Dr. Sutherland.*) Can you give in a copy of the regulations that were issued to the Chinese expedition?—Yes.

9466. Is there any other point upon which you wish to make any observation?—No, as I think I have already shown that the statements which have been advanced by certain medical officers to prove maladministration have been made in ignorance of the circumstances which rendered necessary the acts of which they complained. Ignorance in this respect

will always prevail, therefore the head of the department must expect that many of the measures he will have to adopt for the interests of the service will be misunderstood and even misrepresented. No regulations, however widely they may be promulgated, will in my opinion prevent dissatisfaction, for unless they are very broad and general they will constantly require to be broken, and as the reasons which will necessitate their being broken will not be generally known, the discontent under such circumstances will I believe be greater than it is said to be at present. There will now be a complaint against me with regard to a case that occurred yesterday. An assistant-surgeon was required to be appointed immediately to the 17th lancers; the proper man to be appointed is on sick leave. He is not very sick, nor is he well, but he is not fit to enter at once on the duties, and I am therefore forced to take the next man to him for the good of the service, and that man will complain of it, and very likely write to this Commission.

9467. If a man is sick it is quite clear that he cannot be employed?—If you put forth a printed regulation that the senior is to be taken, the second man would write half a dozen letters to me, and point out this regulation, and would take no reply from me as conclusive.

9468. Do you mean that the officer would maintain that he was not sick, but was fit to take the duty?—No; but that the officer ought to be made to join, or if he could not, when he became the man to be selected he ought to be put on half-pay.

9469. (*Mr. A. Stafford.*) Was there not a surgeon at Scutari who resigned his commission to avoid a court-martial, and who was afterwards restored to the service?—Yes, one sent in his resignation.

9470. Why was he restored?—On inquiry, it was found that there was no evidence that that man on any other occasion had been in a state of intoxication. There was no question that he was intoxicated, and to a very great extent. He was called upon to explain the circumstances, when he said that he went into a brother officer's room, and there he found something in the shape of sangaree, and he took a draught of it, that it was very hot weather at the time he took it, and that it completely overcame him, although not immediately, for he went out to walk, but when he was out he got so affected that he tumbled into a pool of water, and was there seen by Lord William Paulet. It appeared to me, if that was the only individual instance, in which indeed he was hardly the instrument, it was fair to inquire further into the matter before his resignation was accepted. He had been 14 or 15 years in the service, and, as far as I could say, had done good service. Lord Hardinge sent his resignation to me, to ask whether I thought it ought to be accepted. I went to him and told him that his explanation to me was, that it was the result of accident, that he had gone into a brother officer's room, and had partaken of something by which he was quite overcome, after he had gone out to walk; that he had never been found before drunk, nor was

there any officer in the service who could say that he was addicted to drinking.

9471. (*President.*) This was his own account of it?—Yes; I told Lord Hardinge this, and I said that I thought it was rather hard to accept his resignation at once, particularly as he had been required by the medical officer, who went to ask him whether he would resign or stand a court-martial, to write his answer at once, and say whether he would send in his resignation or stand a court-martial; he said that he had no friend to advise with; he was terrified and nervous, and he wrote to say that he would send in his resignation. I stated to Lord Hardinge that I thought it was hard, before we had ascertained that there were grounds for it, to take his commission from him, and I proposed that further inquiries should be made, and that he himself should make every effort to obtain certificates from officers who knew him, and that the Commander-in-Chief should authorize the adjutant-general to write to Colonel Yea, of the 7th Fusiliers, to ascertain what his character was, whether he was a temperate man or not, or whether he indulged in drinking, even in a moderate degree. Colonel Yea was removed, but he himself got a letter from two of the majors of the regiment, and from several other officers, and all those letters were to the effect that he was a very temperate man, and had never been seen drunk during the five years that he had served in the regiment, and had not even been excited by drink. Under these circumstances, I thought that I was not justified in telling Lord Hardinge that I thought his resignation ought to be accepted, in fact he ought to have another trial.

9472. In that way, by tendering his resignation, and that not being accepted, he escaped from the court-martial altogether?—I do not know that a court-martial would have found him guilty, if he could have shown that it was the result of accident. If he had been tried by a court-martial, I think he would have been acquitted—a thing which we do not wish to occur in the service.

9473. (*Mr. A. S. Stafford.*) Was any communication had with Lord William Paulet on the subject?—Yes; the Commander-in-Chief took upon himself to do that, and he was satisfied.

9474. We could obtain the papers relating to this individual, I suppose?—Yes, I should think so, from the Horse Guards.

9475. (*Sir T. Phillips.*) Can you say when the present scale of pay was adopted?—I think it was in 1840.

9476. Was the scale of pay raised then from what it had been before?—The pay of surgeons was diminished—that of others continued the same.

9477. What was the pay of the assistant-surgeon then?—7s. 6d. per diem under 10 years' service, over 10 years 10s.

9478. When was the present pay of the assistant-surgeons fixed?—The present has been the pay of the assistant-surgeon since 1804. Ten shillings a day were given after ten years' service in July 1830.

The witness withdrew.

Dr. JOHN SUTHERLAND further examined.

9479. (*President.*) Before going into the results of the Health of Towns Act on the civil population, have you any remarks to make on any other point?—Yes. Sir John Hall, in his evidence given before this commission on the 19th June, of which I have seen a corrected copy, has made certain observations on the proceedings of the sanitary commission in the East requiring notice. He states (5463) that the sanitary commissioners claim credit for reducing the sickness at Scutari in June 1855, but that they forget that Scutari was supplied from the Crimea, and that the sick had fallen off one half, and he goes on to attribute the immense reduction in the mortality, not

to the improvements in the hospitals, but to the diminution in the number of sick sent from the Crimea, and to the character of the disease having changed. I have to state in reply that we claim no such credit, and that we actually do attribute part of the diminished mortality in the hospitals to the very cause to which Sir John Hall appears desirous of attributing the whole; that though the mortality had fallen by the end of June to less than a tenth part of what it was before our sanitary improvements were commenced, it had fallen to one half in the first three or four weeks of these improvements, without any material diminution in the number of

Dr. John
Sutherland.

*Dr. John
Sutherland.*

17 July 1857.

sick. At the beginning of March 1855, when we first examined these hospitals, the cubic space per bed ranged from 850 to 1,000 cubic feet: this space would have been about enough, if the hospitals had been healthy; it was somewhat too small, because their sanitary condition had been neglected. In the ordinary meaning of the word, the hospitals were not overcrowded, and Dr. Hall's inference as to the diminished mortality being the result of the causes to which he attributes it, is, therefore, not borne out by the facts. The great hospitals at Scutari were magnificent buildings, apparently admirably adapted for their purpose, when superficially looked at, but when carefully examined they were found to be little better than pest-houses. The drainage of all the hospitals was in the highest degree defective and dangerous, the sewers were untrapped and unventilated; they were loaded with filth to such an extent, that during the first week of our sanitary works no less than 100 hand-carts of filth were removed from the sewers of the barrack and general hospitals. These immense sewer cesspools communicated with the interior of the hospitals by a large number of open pipes to the privies, and in certain states of the wind, sewer air was blown over this mass of filth directly into the atmosphere of the wards and corridors, for none of these sewers and privies had any other means of ventilation at that time except into the hospitals; and fever among the sick and healthy was the result. At Kulali, where the sanitary defects were even more serious, there were 50 open privies, and 200 cavalry horses, under wards and quarters, and fatal cases of fever had arisen, directly traceable to these causes. No sufficient means of ventilation had been provided in any of these hospitals. The walls and ceilings of both wards and corridors required constant limewashing throughout. The ward utensils were not removed speedily enough to prevent the air of the wards being tainted. There was an overcharged burial-ground close to the walls of the general hospital. It will be evident, at a glance, that to place either sick or healthy people in any number in these buildings, was to endanger health and life; even healthy people died in them from zymotic diseases, how much more likely to suffer were men in so susceptible a state of constitution as were those who came from the Crimea to Scutari, at the beginning of 1855, and yet we are expected to overlook the obvious consequences of such neglects, and to seek for the causes of the enormous mortality in the Crimea. The more susceptible the sick, the more they were sure to suffer from impure air, and the greater the care which ought to have been bestowed on the sanitary condition of the hospitals; the longer the hospitals were used the more unhealthy would they have become. Out of 6,471 remaining, and admissions in December 1854, the deaths were 60 per 1,000 during the month. In January 1855 the deaths were 147 per 1,000, out of 8,297 sick. In February the sick fell to 7,289, and yet the mortality rose to 182 per 1,000 during the month, while the deaths at Kulali, during the same month, had risen to 245 per 1,000, out of 1,229 sick, showing a progressive increase of mortality. During three weeks ending March 17th, the date when our sanitary works began, 5,522 sick yielded a mortality of 93 per 1,000; and at Kulali, 1,127 sick yielded a mortality of 118 per 1,000 during the same three weeks. After this date the outskirts of all the hospitals were cleansed and kept clean. All dead animals were immediately buried; peat charcoal was extensively used as a deodorizer for sewers, privies, and nuisances; the sewers at the barrack and general hospitals were opened, and their contents removed; flushing tanks were constructed over the heads of each of these sewers, and also at the latrines; and the whole drainage was flushed out several times a day by our own inspector. Ventilating panes, openings, or shafts were introduced into the wards. The windows of the privies, and of the corridors leading to them, were opened or removed, to prevent the effluvia entering the

hospitals, and the sewers were trapped and ventilated. The beds were placed wider apart, and those in the corridors were reduced to one row, while the cubic space was fixed at 1,000 cubic feet per bed. Quicklime wash was constantly used to cleanse and disinfect the saturated walls of the wards and corridors of all the hospitals. The 50 open privies at Kulali were disinfected, closed, and sealed up, and the 200 cavalry horses removed. The wards over them were evacuated, as were also those over the stables at Scutari, in terms of our instructions. The regulations as to future burials, and for disinfecting the large grave-yard at Scutari, were carried out. It is hardly possible to conceive any more striking sanitary contrast than those hospitals presented before and after these measures were put in force. The air in them afterwards was purer than it usually is in most hospitals with which I am acquainted. Our own inspector, during the four months he was in charge of the external works, removed 5,114 hand carts of filth from the vicinity and from the sewers of the barracks and general hospitals; he buried 35 carcasses, and flushed out the drains and latrines by the tanks 466 times. The works of construction were carried out in a most able manner by Major Gordon, R.E., and were most efficient in their operation. Any person conversant with the effect of foul air on the sick, will be able to appreciate the result of these measures on the susceptible cases sent from the Crimea, and the greatly increased chance of recovery they would have when the atmosphere was purified. Within the first three weeks of the improvements, the mortality in all the hospitals fell to one half of what it was during the three weeks before. In three weeks more it was down to one third. During the next three weeks it had fallen to less than a fourth, and in six weeks more it was less than a tenth. At Kulali the mortality fell to an eighteenth part of what it was when the sanitary works were commenced; but at that hospital the defects were the most serious, and the loss of life from them had been the greatest. The number of sick "remained and admitted" into all the hospitals for three weeks before the improvements was 5,522, a number capable of being accommodated with safety if the buildings had been in a good sanitary state. And during the last three weeks of the period the "remained and admitted" amounted to 2,984, and that smaller number had the benefit of the improvements; but part of the immense reduction in the mortality was due, as we have stated in our report, to the less severe character of the cases sent from the Crimea. Dr. Hall further states (5465) that the nuisances at the hospitals had been detected, and that the recommendations made by us had been previously made by his own officers. It would have been more satisfactory if these recommendations had been produced here for the purpose of comparison with our own. Up to this present date I have no knowledge of the existence of any report setting forth either the evils or the remedies. There is, on the contrary, a letter from Dr. Hall to Dr. Smith, on the 20th October 1854, given in the report of the Sebastopol Committee, in which the hospitals are described as satisfactory, and not a hint is given that there were any sanitary defects to remedy. Statements productive of no practical result may have been made. It is even possible that recommendations sufficient may have been put in writing, but it is perfectly certain that the hospitals were in the bad sanitary condition we have described. We had no authority to inquire what recommendations had been made, nor who had neglected them. We had simply to deal with the defects as we found them. On this same subject, referring to the Crimea (5470), (5472), (5473), Dr. Hall says, that our recommendations as to the Crimea had almost all been made before, that we were told so and admitted it, and that it would have been fair if we had stated so. Again I reply, that we had to do simply with the sanitary defects as they existed. We had no authority to inquire into the nature of recommendations

which might have been made, nor why they had not been carried out. When we made our own we knew nothing of what had been advised by anybody else. General statements as to what had been recommended were made to me subsequently, but it was impossible to make allusion to these in our report without criticizing them. Some of the recommendations of which we were told we approved of, but from others, and from sanitary opinions, of which we were also told, we very decidedly differed. Our instructions wisely prevented us from interfering with these controversial matters, and tied us down to dealing simply with any defects we might find resulting from the existing sanitary system in the army. It is necessary at the same time to state, that none of the recommendations of which we heard verbally or otherwise were sufficient to have prevented the sanitary evils we were required to remedy, for none appeared to have been made before the evil occurred, and those that we heard of were incomplete. Being very desirous, however, of bearing testimony to good and efficient sanitary work wherever we saw it, whether such sanitary works were executed by commanding officers, quartermasters, or medical officers, we have done so unreservedly in our report, a far more pleasant duty than criticizing sanitary opinions or recommendations, which, however excellent, had apparently in many important cases produced no adequate result. At (5462) Sir John Hall states that in his opinion the sanitary measures we recommended in the Crimea had no effect in diminishing the amount of sickness and mortality in the army. In our report we have shown the extremely bad and neglected sanitary condition in which we found Balaklava, and the dangers accruing from it to troops and transports. That beautiful village had been allowed under the existing sanitary system to become a hot-bed of pestilence as bad as the worst parts of our worst towns, so that fever, dysentery, and cholera, broke out in it, in its vicinity, and on board ship in the harbour. It does not appear that any steps were taken to organize any sufficient sanitary precautions for the town when it was first occupied. Filth, manure, offal, dead carcases, and imperfectly buried dead bodies, had been allowed to accumulate to such an extent, that we found on our arrival, in March and April 1855, that it would have required the labour of 300 men to have removed, before the warm weather set in, the local causes of disease resulting from not more than six months' occupation of this small area. We have shown in our report what steps we took to arrest cholera and other epidemic diseases on board the transports, and the remarkable success which followed the efficient carrying out of our instructions by the naval surgeons, for inspecting crews to insure immediate treatment in the premonitory stages, and for disinfecting, cleansing, and ventilating affected and unhealthy ships. We have described the sanitary works carried out by our own inspectors during four months, with labour amounting at one period to 150 men, and we have shown that all the measures we at first recommended were substantially executed as labour was forthcoming, and that Balaklava became so clean and healthy as to require little or no interference on our part for many months previous to the evacuation: we have commended the cleanliness of the camp when we first saw it, but we have described and illustrated by drawings the defective drainage and ventilation of many huts, and the dampness arising from heaping earth against the walls, and the results of such defects in producing zymotic disease amongst the troops; we have stated in our report the improvements we advised, and we have given copies of the sketches we sent to head-quarters to indicate their nature. We have shown how directly on our recommendation the 79th regiment was removed from a position so unhealthy that fever had attacked the bulk of the men, and that the disease was immediately arrested; of course we could not trace the progress and result of all our directions step by step; our duty was to see the improvements carried out, and this we

did oftener by personal superintendence than by reference to head-quarters. It sufficed to us that the works were progressing, but when it appeared necessary we applied either personally or by letter to the commander of the forces. It was matter of regret that the progress was not more rapid, but it is always more difficult to remove than to prevent sanitary defects; we have further shown the great extent of deep-drained roads executed over the occupation in the autumn and winter of 1855, which had a most beneficial effect on the health of the troops, and we have attributed to these various sanitary improvements in connection with improved conditions as to diet, clothing, fatigue, &c., the progressive improvement in the health of the army. It is not for me to say whether these results would have taken place had the sanitary commission never gone out, but certainly the most serious evils had continued to accumulate up to the period of our arrival and they disappeared progressively afterwards. Sir John Hall has expressed to this Commission an opinion contrary to ours in regard to the effect of these sanitary measures on the health of the troops. The time I hope has gone by when it is necessary to combat such opinions; measures of the same nature as those carried out in the Crimea have been incorporated in numerous acts of Parliament, and paid for by rate-payers who recognize their greater than money value. Her Majesty's government, which has been instrumental in introducing these laws, contains men fully able to form a judgment as to the practical value of our presence in the East, and we have had the satisfaction of receiving their written approval with their congratulations on the success of our work.

9480. Did the sanitary defects that you observed at Scutari and in the Crimea differ materially from those observed in civil life at home?—No; they were of precisely the same character, modified in the Crimea by a higher temperature. The Scutari hospitals were like other large buildings in which no adequate means of drainage or ventilation had been provided, and the results to the inmates were similar to those observed in civil life, except in their greater severity from the worse character of the defects; Balaklava was like any other very neglected village, where no provision has been made for cleansing, draining, and removal of nuisances. There were some 20,000 men passing in and out daily, and no adequate sanitary arrangements were made for them. There were the transport animals of the army entering the town, and no means of safely disposing of the manure; there were cattle slaughtered for the town and shipping, and no slaughter-house; and there was a horribly offensive burial-ground, where the dead of the previous winter had been laid almost in water and hardly covered with earth, so that fragments of limbs and clothing protruded above the surface. The damp, unventilated, and undrained huts in some parts of the camp produced consequences very similar to those observed in cellar-dwellings at home. The half-buried huts of the Sardinian camp, however convenient in construction, furnished a large proportion of fever cases among their occupants.

9481. Will you state what steps have been taken of late years for improving the sanitary condition of town populations at home?—Since the publication of Mr. Chadwick's report, and since the Health of Towns Commission in 1842, great advances have been made in sanitary science, and also in its practical applications. Many towns have obtained local sanitary acts to enable the authorities to deal with the local causes of disease within their jurisdiction. The public health act has enabled similar provisions to be extended to a number of smaller towns and districts. The metropolis has now the benefit of a special sanitary act. Acts have been for some time in operation for the removal of nuisances not requiring the execution of permanent works; for the prevention of smoke; for enabling extra precautions to be taken to prevent epidemic diseases; for abolishing intramural burial and for establishing and regulating new cemeteries; for establishing baths

Dr. John Sutherland.

Sutherland.*

17 July 1857.

and washhouses; and though last, not least, an exceedingly valuable act for the regulation of common lodging-houses introduced by the Earl of Shaftesbury, which has been of very great service in arresting disease amongst the humblest classes of society.

9482. Will you state, generally, the object of these acts?—The local and public health acts are chiefly intended to confer powers on local authorities to execute works for providing drainage, sewerage, water supply, and paving; the fixing the width of new streets, cleansing, removal of nuisances, regulation of slaughter-houses, common lodging houses, and similar matters. Powers of inspection are conferred, and officers of health and sanitary inspectors may be appointed. The nuisances removal and diseases prevention act gives powers for removing local causes of disease which can be dealt with at once, for cleansing houses, for providing extra medical aid, &c. Under the burial acts, intramural interments have been abolished over nearly the whole of England, and properly regulated cemeteries have been provided. The common lodging houses act enables the police or local authorities to inspect and to regulate such houses in matters respecting cleansing, lime-washing, ventilation, reduction of over-crowding, and other similar matters.

9483. Do the provisions in these acts differ in any respect practically from the sanitary regulations in the army?—Yes. They are far more explicit and practical in their character, and they contain a specific machinery by which defects, proved on inspection, and reported on, may be remedied as soon as practicable, and in many cases immediately; while in the army, reporting or recommending is apparently the only object obtained at present; what is wanted in the army is intelligent sanitary advice, and the means of giving it immediate practical effect. I do not consider, however, that the provisions in the civil sanitary acts are by any means perfect. They are directed mainly against external causes of disease, those outside dwellings; but except in the case of common lodging houses, they do not provide for the removal of sanitary defects, equally serious in character, connected with the interior of dwelling-houses, such as those arising from defective ventilation, over-crowding, want of cleanliness, and saturation of the walls with organic matter, &c. Until some further provision is made for dealing with these defects in the dwellings of the labouring classes, there will still be much preventable disease and mortality among them, even after the external conditions are improved.

9484. Have these various sanitary acts worked well in practice?—Sanitary legislation being only of very recent origin, at least in these days, and being moreover very difficult, it has been found necessary in practice to introduce amendments from time to time to meet classes of cases not previously provided for; but all things considered, the acts have already conferred great benefits on the working classes. The water supply of many towns, which is the key to all sanitary improvement, has been improved or provided anew; extensive works of sewerage, drainage and paving have been carried out. There are some towns in which the whole works have been completed, cesspools abolished, every house and cottage supplied with a water-closet, water pipe, and drainage, and the sewage applied to agricultural purposes. There are many towns in which these works are in progress, and every year will lead to their further extension. About 2,000 sanitary inspectors and officers of health are employed under the various acts I have specified. The removal of nuisances is more easily effected; public baths and washhouses are in operation in a large number of parishes with most beneficial results.

9485. Have sanitary measures been attended by a corresponding improvement in the public health?—Beyond all doubt. There are two tests of such improvement, namely, a diminution of sickness and a diminution of mortality. The former of these tests cannot well be applied statistically, and must be a matter of observation on the part of medical men. The latter, namely the mortality test, can only be of

value when applied over a sufficient number of years. There has been a considerable falling off in the mortality of Liverpool since its sanitary acts came into operation. The city of London and the metropolis generally affords another similar example. Lancaster, Croydon, and other improved towns also show in some instances a very considerable diminution. There are even contrasts of improved and unimproved adjoining parishes; but if the falling off in mortality were even greater than it is, the time is too short to admit of positive deductions as to the amount. Besides, a certain time must elapse before drainage works can purify the soil from the filth with which it has been previously saturated. As to the falling off in sickness we have clear testimony, especially under the operation of Lord Shaftesbury's act. Mr. Assistant Commissioner Harris, of the metropolitan police, in a report to Sir George Grey just published, describes the common lodging houses, before the passing of this act, as "crowded and filthy, without water or ventilation, without the least regard to cleanliness or decency, and hot beds of disease, misery, and crime." Under the operation of the police inspection the evils attending such houses have been in a great degree removed or abated. "The accommodation given in the registered houses consists of clean beds and bedding, well-ventilated and lime-washed sleeping rooms, well-cleaned kitchens, plenty of water for all purposes, and good water-closets and sinks, drained and trapped to the common sewer, wherever such is available." In the metropolis, in a period somewhat exceeding five years, 700,655 visits of inspection have been paid to those houses, by day and night. From September 1851 to 1st of January 1857, the number of lodgers allowed to registered houses in the metropolis had been 91,106, and the total cases of sickness, for which the police had to obtain medical advice, had been only 469. The officers of health and district medical officers are unanimous in their opinion as to the great diminution of sickness from the strict sanitary precautions exercised in these houses, while zymotic diseases still prevail amongst the poor in their immediate neighbourhood. Similar testimony has been borne to the very beneficial operation of the common lodging houses act all over the country, and I may cite the experience obtained at Macclesfield as an illustration of the good which has been accomplished in the provinces. Referring to the common lodging houses, the town clerk says, "All these pest-houses have given place to clean and well-ventilated apartments," and he goes on to state that out of 115,000 lodgments in these improved houses during the year, "there were only nine cases of sickness and four deaths, three of the latter being children, and the fourth an adult who died from the effects of imprudently drinking cold water." "No fever or other epidemic diseases have visited a single lodging house;" no mere verbal description can convey an idea to those who have not visited the lodging houses before and after registration of the immense sanitary improvement effected under this act.

9486. What has been the result of these improvements as regards the prevalence of epidemic cholera?—After the epidemic of 1854, Sir Benjamin Hall directed an inquiry to be made into the results of sanitary improvements which had been carried out in circumscribed localities all over the metropolis, in the interval between the epidemics of 1849 and 1854. These improvements may be stated generally as consisting in flagging and paving of bad localities, covering pestiferous ditches, filling up cesspools, introducing sanitary improvements into groups of dwelling-houses, substituting water-closets with impervious pipe drainage instead of privies with brick drains, ventilating, cleansing, and lime-washing houses in unhealthy courts. And the results may be generally described as exemption from cholera, though the disease prevailed in the neighbourhood; the presence of the epidemic being shown only by the existence of a few mild cases of diarrhoea in the improved districts. In the common lodging houses under inspection, there were

61 deaths from cholera among 82,000 inmates, being about one-sixth of the cholera mortality proportionally over the whole metropolis in 1854. One remarkable instance of improvement was found to have occurred in Lambeth-square, Lambeth, which consists of 35 well-built houses, rented at 26*l.* a year each. These houses had formerly no water-closets, but they had open privies, opening into badly constructed drains which passed under the houses, exemplifying on a small scale the drainage defects at Scutari. In 1849 six of the inhabitants of these houses died of cholera. They suffered much from epidemic disease, and the mortality was always high. In 1851-52, there were 80 attacks of typhus, scarlet fever, and small-pox, and 24 deaths among a population of 434. In 20 years 1,250*l.* had been spent unintelligently in endeavouring to remedy the evils. The case was referred to the first Board of Health, early in 1852, who recommended the removal of the existing drainage, and the substitution of pipe drains and water closets, which cost less than 200*l.* for the whole square. The mortality has since fallen about one-half, the deaths from zymotic disease have fallen to one-seventh, and there was not a single death from cholera in 1854.

9487. Have you compared the cholera mortality in the years when the epidemic existed?—Yes.

9488. Otherwise it would be valueless?—The object of Sir Benjamin Hall's inquiry was to ascertain whether certain improvements in the metropolis had been attended with diminished liability to cholera, and it appeared that there was a falling off in this instance from 6 deaths in the epidemic of 1849 to none in the next epidemic in 1854, the intervening period, preceding the improvements, being filled up by other epidemic disease, such as fever.

9489. Was cholera prevalent in 1854?—Yes, all round.

9490. What have been the results of sanitary improvements introduced into the model lodging houses of the metropolis?—The results, so far, have been very striking. These houses have no cesspools, they have all trapped water-closets, properly drained, plenty of water, they are free from nuisances, and have adequate means of ventilation. Some of those occupied by families are of large dimensions, and accommodate from 300 to 600 or 700 persons of all ages. Dr. Southwood Smith, in his lectures of epidemics published last year, has given the mortality in these houses for a period of from three to five years, from which it appears that the average annual proportion of deaths to 1,000 living was 12·6 to 13·9, a little above one-half that of the metropolis. I perceive by the last report of the Metropolitan Association, that the mortality in their houses during the last three years ending June 5th 1857, is stated at little more than half that of the metropolis. The statistics of these houses have not been hitherto kept with sufficient minuteness, but from information I have received from the association, it appears that the mortality in all their family houses among persons above ten years of age has not exceeded nine per 1,000 per annum. During the cholera of 1854, all of these houses escaped the epidemic, while it existed in the districts where they are situated, except in one family, consisting of 10 persons living in one of the Albert street dwellings, in the basement, with about 276 cubic feet of space for each inmate, and this over crowding led to four deaths among them from cholera.

9491. Is there any reason in your estimation why barracks could not be rendered as healthy as buildings of the classes you have described?—None whatever. I have heard all the reasons usually assigned for the extravagantly high mortality existing in the army, and I can see no reason whatever why, if sanitary measures were applied with due intelligence to barracks, and otherwise, most of the excessive mortality in the army might not be swept away.

9492. What precautions have been usually adopted under the Acts of Parliament for mitigating or pre-

venting the ravages of epidemic disease?—Besides the usual sanitary measures, namely, cleansing, removal of nuisances, lime-washing, ventilation, and the removal of inhabitants from infected houses and localities, the great principle which has been established in civil practice during the last 10 years is the paramount necessity and importance of the early detection and immediate treatment of the premonitory stages. This is especially necessary as regards cholera, for the early treatment of which it was the custom formerly to depend on opening numerous dispensaries, and warning the people from house to house of the necessity of instant application for medical aid in all cases of diarrhoea. These steps were found in practice to be of very little use, because although many cases of diarrhoea came under treatment, it was found that the cholera cases occurred in persons who had not considered the premonitory diarrhoea as of sufficient importance to call for immediate treatment. It has been established with regard to cholera, that important changes take place in the blood before the disease manifests itself; and that in the severest premonitory cases, those cases which, however apparently slight, are about to pass into cholera, the patient is apathetic, and will not apply for aid. This was in fact found to be a law of the epidemic, and hence the practice, which was adopted on my own recommendation, of sending the medical officer with medicines from house to house in infected districts, to inspect the inmates, and treat them on the spot. Wherever this practice has been efficiently carried out, there has been a great diminution in the mortality, while, on the contrary, wherever the sick have been trusted to make application themselves, the rate of mortality has been very high. Inspection has been used most advantageously in the army, either directly or by watching the latrines, but I am not sure that it was in use in the Crimea. We had no power to interfere with medical treatment; but when cholera appeared I wrote to Dr. Hall, recommending inspection of latrines or otherwise for the discovery of premonitory diarrhoea. We had it carried out as strictly as possible on board ship at Balaklava, and had only 90 cases of cholera altogether, in the whole transport service, during four months. It may be laid down as a principle, that wherever, during a cholera epidemic, soldiers are only warned to apply to the medical officer for relief in premonitory diarrhoea there will be a high rate of mortality; such, at all events, has been our uniform experience in civil life; and hence the power, under the contagious disease prevention act, to appoint medical house-to-house visitors, to inspect the people in affected districts, and to treat diarrhoea at once.

9493. (*Mr. J. R. Martin.*) Do you not think that had a skilful sanitary officer been appointed in the first instance at Scutari, and afterwards in the Crimea, the serious sanitary defects in the hospitals and at Balaklava, to which you have adverted, might have been prevented?—Certainly. It appears to me that with a properly-arranged sanitary service an officer ought to have been detached to each of those places for special duty; and if a qualified sanitary officer had been sent out in the first instance, I think he could not have failed to detect the condition of the hospitals on the Bosphorus and, in addition to that, there would have been the means acquired by his knowledge, and by coming into immediate contact with the executive department, of carrying out the improvements that were desirable. The disadvantages attending the existing system are such that even though the medical officer understood what was wrong, and although he might recommend what was necessary to be done, he has no means of bringing his knowledge practically to bear upon the improvements. With regard to the Crimea, in the same way, I think that a sanitary officer should have been directed to see to the health of the base of the whole operations,—that duty should have been placed upon some sanitary officer.

9494. Do you agree with Sir John Hall that a separate sanitary officer would not be required for the army in the field, as the principal medical officer could

Dr. John Sutherland.

17 July 1857.

*Dr John
Sutherland.*

17 July 1857.

do all that was required, and that such an officer would not be an advantage to the service?—I do not agree with Sir John Hall's opinion; I think that the principal medical officer of such an army as was in the Crimea had ample work to fill his hands. It would have been a great relief to Sir John Hall and a great advantage to the public service if a sanitary officer had been detached for the special purpose.

9495. Do you agree with him that a medical education usually supplies general principles of sanitary knowledge sufficient to enable a medical officer to deal with such matters as you have described?—No, I think not; what is wanted is not only knowledge, but practical experience—those are the two things wanted. Referring to the evidence that I have already given, I am of opinion that if the sanitary element were more introduced into the army it would be a very great advantage.

9496. Are you of opinion, considering the nature of the cases that came from the Crimea to Scutari and the susceptible condition of the sick, that extra care on all matters connected with the bedding and comforts for the sick should have been taken as well as extra sanitary precautions?—Beyond all question; I think that every circumstance likely to benefit men in that highly susceptible state should have been much more attended to; the whole hygienic management of the sick, including bedding, linen, and sanitary precautions requires a far greater amount of attention than it has hitherto received.

9497. Referring to all that you have stated, and to all that you know of the sanitary defects of the arrangements in the army, does not the result prove this, that in all cases, and at all times, when certain kinds of reports were alleged to have been made, nothing was practically done?—In some instances there were practical improvements carried out. There is a gentleman at this table who was zealous in making recommendations, Mr. Alexander, and his recommendations as to his hospitals were efficiently carried out. There are instances of sanitary works mentioned in our report in the hospitals themselves which presuppose on the part of the medical officers recommendations, either in writing or verbally, and those recommendations I can vouch for having been carried out; whether they were made or not, at all events the work was done. In a number of other instances recommendations were made, and the work was not done. What is really wanted is, that there should be some means of rendering those recommendations practically available.

9498. In the instances of the great hospitals that you refer to, whatever may have been the recommendations previously made, nothing had been done until you went there?—It is possible something may have been done before—we can only speak to what we saw—we were not authorized to make inquiry as to neglects.

9499. Referring to the great results mentioned by you as emanating from direct sanitary regulations at home, is it not manifest that without the services of 2,000 sanitary officers, as mentioned by you, the various acts would have proved, practically, failures?—They are executive officers employed by local boards to carry out the provisions of the acts.

9500. To be practically useful there must be, not only sanitary regulations, but persons specially appointed to see that the provisions of the sanitary acts are carried out?—Yes; as to the army, most of that duty could be very well done by regimental surgeons, but there are cases, as I have mentioned, where detaching a sanitary officer would be of great importance. The army should be so provided that it could supply itself with its own sanitary inspectors. Suppose an army going to the East, and the director-general had a sanitary staff that he had perfect confidence in, he might select one inspector, and detach him, and say, You have the sanitary responsibility of the army, and *quoad hoc* he would be the sanitary officer, in the same sense that Dr. Smith sends a man to be the principal medical officer.

9501. (*President.*) I think you wrote a letter to Lord Shaftesbury which was published, in which you stated that you found nearly everything had been recommended by the medical officers of the army when you arrived in the Crimea?—I should like to see the letter before replying to your question. If I recollect rightly, it had reference to certain recommendations.

9502. (*Dr. A. Smith.*) With reference to cholera, and the necessity for vigilance, in order to ascertain the premonitory symptoms, are you not aware that it has been usual in the army, with a view to detect cases of diarrhoea during the prevalence of cholera, to post sentries over the latrines or privies?—Yes, and I am aware that that has been attended with most satisfactory results.

9503. Are you aware that there was circulated, before the cholera appeared in this country, a small book of instructions in which that was enjoined in all cases?—No, but I know the fact, as to inspection having been made in certain instances at home.

9504. You were asked whether, if a sanitary officer had been placed at Scutari and at Balaklava, great advantage would not have arisen?—Yes.

9505. With reference to that question, do you think that if they had been placed there, their recommendations would have been in the slightest degree attended to by the military?—A recommendation involves in it the means whereby the work should be done. I think I guarded my answer in that way. At present, however willing a man may be to do his duty in this matter, however many recommendations he may make, there is no necessary connection between the recommendation and the execution.

9506. Are you aware that great efforts were made by the medical officers at Balaklava to get the streets cleared, the graveyards covered with an additional depth of soil, and all kinds of filth removed, and that no attention was paid to them. They said, "Yes, yes; when we have men to spare it shall be done?"—I have no definite information on that point, we were not authorized to inquire why improvements had not been carried out. And even supposing that had been done, my point is, that if a sanitary officer had been on the spot at first, there would have been no necessity for correcting evils, as he would have prevented the whole mischief from the very beginning.

9507. (*President.*) He would not have allowed those things to accumulate?—No. In taking possession of the base of operations, it is of primary importance to defend the base from the enemy and in like manner it is of primary importance to defend the base against epidemic disease.

9508. (*Dr. A. Smith.*) Do you think that if a sanitary officer had been placed at Balaklava his recommendations would have been attended to at the time of the bustle?—I merely reply again, that my recommendation for putting a sanitary officer there involves in it the possibility of execution. I never contemplated placing a man in the Crimea whose recommendations were not to be listened to.

9509. Supposing that his recommendations were not listened to, what would have been the use of a sanitary officer in Balaklava though he had been there?—I blame nobody. I do not blame Dr. Smith for not sending a sanitary officer out; but I say this, that if the sanitary element had been in the army—if there had been a sanitary officer sent out, and there had been a proper connection between the officer and the work, the officer should have been there.

9510. You were asked whether, if a sanitary officer had been there and another at Scutari, a great deal of good would have been effected?—Undoubtedly.

9511. (*Mr. J. R. Martin.*) Does not the whole question of an army sanitary officer, to your mind, present the necessity of his being a highly-qualified officer, having the confidence of the government which appoints him; and does it not necessarily arise from that, that where it is practicable his suggestions shall be carried into effect?—I think you would require to

make some provision, the same as we have in our sanitary acts. An inspector, or officer of health, is an officer appointed under the act to take certain defined proceedings, and upon his proceedings there are certain other defined proceedings which take place. It is essentially necessary, in order to carry out the intention of the act, not only to appoint an officer, but to take care that the officer so appointed shall give advice, which advice shall be followed.

9512. (*Sir T. Phillips.*) How are you to legislate for things to be done in the Crimea?—It could only be done by army regulation.

9513. Supposing sanitary regulations to be neglected, and disease to be manifested, what are the special types of disease that you would expect most likely to prevail?—The special types of disease depend very much upon the nature of the defects, for instance, deficient drainage, filth, and over-crowding generally, predispose to epidemic diseases. Again, suppose you have over-crowding and defective ventilation with sedentary habits, as with tailors, there is a great tendency to pulmonary affections. Again, defective ventilation may act, almost by itself. It is quite possible to produce those evils in an otherwise healthy house, by simply over-crowding people together.

9514. You would expect the epidemic to take the form either of fever or bowel complaint?—Yes, or dysentery or cholera.

9515. Those would be the most generally prevalent?—Yes.

9516. (*Mr. J. R. Martin.*) They are the scourges of armies?—Yes.

9517. (*Sir T. Phillips.*) You say that over-crowding dwellings may also produce pulmonary diseases?—Yes; even if those other defects of which we have been talking were not present.

9518. Are you not aware that diseases of the bowels and fevers produce a very small amount of the mortality in the army at home?—Yes, but they produce a higher amount of mortality—the zymotic class generally produces a larger amount of mortality in the army than it does in civil life, but zymotic disease does not scourge an army here as it does in the field. At home zymotic disease is more prevalent in the army than it is in civil life.

9519. Take the diseases of the stomach and bowels in the foot guards, they are 5, and in the civil population 4, in one thousand?—Yes.

9520. Fevers and eruptive fevers in the Foot Guards are 2·4, and in the civil population 1·2; and of pulmonary diseases you have in the army 13·8 and in civil life 6·3?—Yes; but you have fevers producing double the amount of mortality in the army that they do in civil life.

9521. The great source of disease at home in the army is of the pulmonary class?—Yes; there is a remarkable similarity between the causes of pulmonary disease in the army and in sedentary professions. The army suffers much less from the causes that produce zymotic diseases at home than almost anywhere else—it seems to suffer most from that class of causes that produce chest diseases.

9522. It seems that we must look for the correction of the evil at home in the direction of pulmonary complaints?—Yes; and in removing their causes you would at the same time cut off the mortality from epidemics.

9523. (*President.*) Do you look to the correction of pulmonary disease by improved ventilation?—Yes; and by diminishing over-crowding, by gymnastics, and other similar exercises.

The witness withdrew.

Dr. T. GRAHAM BALFOUR examined.

9524. (*President.*) You are surgeon to the Royal Military Asylum at Chelsea?—Yes.

9525. How long have you been in the army?—Upwards of 21 years; I was 4½ years on the staff, 8 years in the Grenadier Guards, and 9 in the Royal Military Asylum.

9526. You have paid considerable attention to military hygiene, and to sanitary science?—Yes; when I first joined the army, I was appointed by the Director-General to assist Dr. Marshall and Colonel Tulloch, in the preparation of a volume on the health of the troops serving in the West Indies. On the retirement of Dr. Marshall, I was associated with Colonel Tulloch in the preparation of the subsequent reports. In the course of that duty I was much struck with the great amount of mortality generally, and the large proportion of it which appeared to be caused by preventable disease. I subsequently had the opportunity of verifying my opinion on this point by watching the results which followed the adoption of various sanitary measures which we recommended in our report, and which were carried out to a greater or less extent. The results obtained from these changes fully confirmed my previous opinions, and led me to continue to make the subject my special study.

9527. Do not you consider that proper diet for the soldier is essential to maintain him in health and consequent efficiency?—Most essential.

9528. Is the present diet of the soldier well-calculated to produce this effect?—I think not; it would scarcely be possible to devise anything worse calculated for the purpose, than the diet of the soldier was when I first joined the service. He had then two meals a day, breakfast and dinner; and the period between dinner and breakfast the following day was 19 hours. His dinner consisted of perpetual boiled beef and broth. Subsequently the introduction of the

evening meal, which had been pressed upon the attention of the military authorities by the medical officers for many years, effected a very great improvement. In other respects, his diet as laid down by regulation continues the same as at that period. It is monotonous to a degree. I have frequently seen, in a barrack room, soldiers, and especially the older ones, leave the broth untouched.

9529. Would it be possible to improve the soldiers' diet by infusing into it greater variety?—I know practically it is quite possible to do so. When I was appointed to the Royal Military Asylum, I found the system of feeding the boys pretty much the same as that in the army, but not quite so monotonous, as they had baked mutton on Sundays, suet pudding three days in the week, and boiled beef on the other three days; the meat was always boiled, but they did not get broth, the liquor being thrown away. They had abundance of food, their dinner consisting, on meat days, of 11 ounces of meat without bone, which is more than is given to the soldier, but they did not eat it with relish, and quantities of food were taken away to the hog tub. The boys were pale and feeble, and evidently in a very low state of health. Mr. Benjamin Phillips, a very high authority on scrofulous disease, told me, that when he examined the school, while engaged in preparing his work on scrofula for publication, he found the boys lower in point of physique than almost any school he had examined, even including those of the workhouses. After a careful examination of the dietaries of almost all the principal schools established for children in England and Scotland, I prepared a scale of diet, which was sanctioned by the Commissioners in December 1848, and, with a few slight modifications, is now in use at the asylum. The chief points I kept in view were, to give a sufficient amount of food in varied and pala-

table forms, and without long intervals of fasting. The following are the old and the present scales of dietaries.

The same were delivered in as follows :

ROYAL MILITARY ASYLUM, CHELSEA.

Diet Table of the Boys of the Asylum in 1848.

Days of Week.	Breakfast at 8 A.M.	Dinner at 1 P.M.	Supper at 6 P.M.
Sunday, Tuesday, and Thursday,	Cocoa . . ½ oz. Sugar . . ½ oz. Milk . . ½ gill. Bread . . 5 oz.	Beef . . 11 oz. Potatoes . 8 „ Bread . . 5 „ Table beer ½ pt.	Bread 5 oz. Milk . . ½ pt.
Monday, Wednesday, and Friday,	Ditto	Suet . . 2 oz. Flour . . 8 „ Potatoes . 8 „ Bread . . 5 „ Table beer ½ pt.	„
Saturday	„	Rt.mutton 11oz. Potatoes . 8 „ Bread . . 5 „ Beer . . ½ pt.	„

Children under 8 years of age have 8 oz. of meat instead of 11 oz., and 4 oz. of bread instead of 5 oz.

Diet Table of the Boys of the Asylum, in July, 1857.

Days of Week.	Breakfast at 8 A.M.	Dinner at 1 P.M.	At half-past 3 P.M.	Supper at 8 P.M.
Sunday .	Cocoa ½ oz. Sugar ½ „ Milk ½ gill Bread 5 oz.	Irish beef, 6 oz. stew potatoes, 8 „ Onions, ½ „ Pud- flour, 2 „ ding suet, ½ „ Bread . . 2½ „	Bread 2½ oz.	Bread 5 oz. Milk ½ pt.
Monday .	„ . .	Boiled beef . 6 oz. Broth . . ½ pt. Greens . . 6 oz. Bread . . 2½ „	„	„
Tuesday .	„ . .	Roast mutton . 6 oz. Yorkshire flour 4 oz. pudding suet ½ „ Bread . . 2½ „	„	„
Wednesday	„ . .	Irish beef . 6 oz. stew potatoes 6 „ Onions . ½ „ Bread . . 2½ „	„	„
Thursday	„ . .	Roast mutton. 8 oz. Rice rice . 2 „ pud- milk . ½ pt. ding sugar . ½ oz. Bread . . 2½ „	„	„
Friday .	„ . .	Stewed beef . 6 oz. Rice . . 3 „ Treacle . . ½ „ Bread . . 2½ „	„	„
Saturday .	„ . .	Boiled beef . 6 oz. Potatoes . 6 „ Broth . . ½ pt. Bread . . 2½ oz.	„	„

Children under 8 to have 4 oz. of meat instead of 6 oz.

9530. Did not the improvements in the cooking which you have mentioned involve a change in the kitchen, or was it already a good one, and fitted with the necessary appliances?—The kitchen was an old one, and no barrack kitchen in the kingdom would have lost by a comparison with it. There was an old oven in it of the kind known as the Rumford roaster, which was used for baking the mutton on Sundays, and for the serjeants and nurses during the week. There was also a square copper, about 4½ by 3½ feet, and 2 feet deep, with a fire underneath. Everything was thrown into this, the meat and potatoes in nets, and the puddings in pudding cloths. Everything was cooked in this. It would have been quite absurd to talk of making Irish stew or broth in it. I got over the difficulty by procuring eight large tin pails, like milk pails, into which the materials for broth or stew were put, and those pails were then placed in the copper, which was half-full of boiling water, forming very nearly what is called a *bain marie*. Among the advantages of this system were that of carrying the dinners hot into the hall, and cooking in various forms for different companies at the same time ; and it was also impossible to singe or burn the dinner, or broth. The system was found to answer so well that when a new kitchen was built with steam apparatus, we continued to cook the dinner on the same plan.

9531. Did the improvement in the dietary greatly increase its cost?—On the contrary it saved nearly 300*l.* a-year in the feeding of the establishment. By introducing a greater variety, the boys took the whole of their food with relish, and I was able to get them into good condition by distributing the same amount of meat over seven days that they previously had in four.

9532. Were the results satisfactory?—The results were far beyond my expectation. Comparing the sickness and mortality in the establishment for the 10 years previous to my appointment, and for the eight years and a half that have passed since these alterations were introduced, I find that the sickness has been reduced by about one-third, and the annual mortality has fallen from 9·7 per 1,000 of the strength on the average of 10 years to 4·9 per 1,000 on the average of eight years and a half. This is not entirely attributable to the change of diet, though that was a most important means. At the same time there were other improvements introduced, such as increased space in the dormitories, improved ventilation, and abundant means of cold bathing—all of which are most important elements in preserving health.

9533. Do you think that the introduction of similar changes into the army would be followed by similar results?—Yes ; as to health I have no doubt it would.

9534. (*Sir T. Phillips.*) What is the character of disease that produces the greatest amount of mortality amongst the boys at Chelsea?—Looking back to the previous period, I should say gastric fever and strumous disease.

9535. Those were the types formerly?—Yes.

9536. Have they been principally reduced by the changes which you have described?—Yes. I may mention another point with regard to health, that on the average of the 10 years the proportion of boys reported unfit for military service by the surgeon was 12·4 per 1,000 annually, principally on account of scrofulous cicatrices on the neck that would have prevented them wearing the military stock, and during the eight years and a half it has been reduced to 4·55 per 1,000. It is now very little more than one-third of what it used to be.

9537. (*President.*) Those scrofulous diseases at subsequent periods of life frequently become pulmonary?—Very often.

9538. Is it desirable to improve the cooking in the hospitals?—Yes ; I think it very desirable to do so. In the Royal Military Asylum I had a cooking apparatus erected on a plan of my own. It is very compact and very economical of fuel, and has answered admirably. I believe Dr. Smith has been so much pleased with it, that he intends to adopt it as a model for all regimental hospitals at home ; and Colonel Lindsay, of the Guards, who has paid great attention to the subject of cooking, saw it the other day, and stated to me that it was the most compact and most economical cooking apparatus he had ever seen.

9539. (*Mr. J. R. Martin.*) Does it comprise stewing as well as roasting and boiling?—Yes.

9540. (*President.*) Have you seen the plan for field kitchens which Mr. Bracebridge has published?—Yes, I have, and I think it would answer extremely well, provided he carries it out in the mode I have stated, of not passing the steam through the fluid to be cooked, but passing it into the water outside, the cooking being done as at Chelsea, in tin vessels, placed in the water. I think it would be very convenient.

9541. Is the cubic space allowed in barracks sufficient?—No ; I think the amount of space allowed by regulation is too small, but the distribution, according to the ordnance returns which have passed through my hands, is, in many instances, very far below the amount stated in the regulations.

9542. Have you been in the barrack rooms at night, and in what state have you usually found them?—Generally insufferable from want of ventilation.

9543. You have seen the urine tubs in the rooms, how would you describe their state?—As beyond description abominable. Urinals and water-closets for night use should have been long ago introduced into the army. When I joined the Royal Military Asylum, I found the urine tubs used by the boys, and not merely as urine tubs, but for all other purposes. I obtained permission to introduce urinals and water-closets, in the proportion of one to every two dormitories. They have now been six years in use, and there is no unpleasant smell from them, and no inconvenience. Moderate care is required in cleaning the urinals, which is done with soft soap and a cane brush every morning. The water-closet introduced was Underhay's patent, of which this is a sketch (*producing the same*).

9544. Would not the urinals require an unlimited supply of water?—No; the system at Chelsea is, that the water is turned on half an hour after tattoo, and half an hour after reveillé. It is not allowed to run during the whole night; but where water cannot be supplied in sufficient quantity, the soldiers in barracks ought to be supplied with chamber pots.

9545. Colonel Chapman has said in his evidence, that if you have a good site for a barrack, he thinks the engineer and the military officer are quite able to determine on the plan of the barrack, without any assistance from the medical officer. Do you agree with that?—I think that opinion was formed without due consideration. Had Colonel Chapman referred merely to the materials and the mode of using them, or had it been a question relating to architect's or builder's work alone, I should have agreed with him, but it is one that bears an important reference to health. The engineer officers seldom reside in barracks, and when there, are not mixed up in any way with the soldiers. The regimental medical officers, on the contrary, are obliged to be constantly among them, and see the practical evils in the barracks; they hear the men's remarks and complaints, and are therefore well qualified to suggest improvements in barracks. I feel quite sure that if the engineer officers had one-tenth of the experience that medical officers have of the pernicious state of barrack rooms from want of ventilation, and if they had witnessed the use of the disgusting and indecent urine tubs, they would long ere this have improved the one and abolished the other. A soldiers' barrack room at present has not the least pretension to the comforts of an ordinary dwelling-house, but what is infinitely more disgraceful, there is not even an attempt made to introduce into it the decencies of civilized life.

9546. You have had great opportunities of examining the returns sent to the Medical Board, do you think that the nomenclature of diseases in them is a good one?—No; it is very far behind modern science. It is the same, with one or two trifling exceptions, as that adopted by Sir James Macgregor in 1815. It is true that deviations from the published list are permitted, if supported by the most respectable authorities, but I think that the department should keep up the list to the state of modern science, without trusting to the discretion of individual officers. I am of opinion that Dr. Farr's statistical nosology, or the classification of diseases adopted by the statistical congress of Paris in 1855, would be a great improvement upon that which is now in use in the army; the latter classification is given in the *Compte Rendu du Congrès International de Statistique*, and a summary of it at page 82 of the 16th annual report of the registrar-general, and it would come very much more up to the mark than that now in use in the department.

9547. Can you make any suggestions as to reducing the amount of writing of medical officers?—One obvious means of doing so would be to print the diseases in the returns, as was done in the sanitary reports originated by Colonel Tulloch and myself. A step in this direction was taken lately by having the names printed in the monthly returns, but this was not done judiciously. Instead of adopting the classification of diseases which is followed in the sanitary reports, a

new classification of diseases was introduced, differing in no great principle from that which is used in the sanitary reports, but still differing enough in minor details to give all the trouble of rearranging it.

9548. Do you think that the medical register could be dispensed with in its present form?—No; but by the adoption of a good admission and discharge book, and of a record book, such as has been long in use in the Guards, much of the writing might be dispensed with. I can say from experience that the record book furnishes all the information necessary to enable the medical officer to make up his papers for Chelsea.

9549. Have you had any experience of the difficulties encountered by medical officers in their endeavours to carry out sanitary measures in the army?—Yes, during my service in the Guards I had opportunities of seeing this. Perhaps the best mode of illustrating the subject would be to give one or two instances. When I joined the Guards I was first quartered in the Tower. I found the Tower ditch was in a very disgraceful state, and the troops were constantly suffering from fever. I found that for many years the medical officers had been representing this as a cause of disease, but they could not get it drained, and the only reason we could ever find was, that making the ditch a dry ditch instead of a wet one, would interfere with the defences of the Tower. In 1842, typhus fever was very prevalent in the battalion of Guards quartered there, and the inhabitants on Tower Hill became alarmed lest the disease should spread to them; they applied the pressure of public opinion, in consequence of which the ditch was drained. This was followed by a very important change in the type of fever as it has prevailed since. (*See Appendix No. LXIV.*)

At the same time the water which the soldiers had to drink was drawn from the centre of the Thames just off the Tower, and passed through a coarse gravel filter and distributed to the cisterns. It was so full of animalcules and every other sort of filth, that I never washed myself in it without having it first boiled. We represented year after year this state of matters, but never could get any remedy applied until 1849, when the cholera was imminent.

9550. Was it used by the men for potable purposes?—It was the only water they had to use. In 1849, when cholera was threatening, this supply was at last got rid of, mainly, I believe, through the exertions of Captain Simmons, of the Royal Engineers, and the troops are now supplied with water for cooking and drinking from an artesian well at the Mint.

In 1845 the armoury was burnt down in the Tower, and a new barrack was erected on its site—certainly not before it was wanted—because the accommodation was very bad. The barrack was finished in the beginning of 1849; fever was then prevailing among the men, and cholera threatening. The surgeon applied to have the new barrack given over for the use of the men, and he got two rooms; he remonstrated through his commanding officer with the authorities, when he was informed that he could not have more given over to him, as they were full of stores—blankets, I believe. On suggesting that the stores might be put into the old barracks, he was told that they were a great deal too damp to put stores into, and it was only in consequence of an energetic remonstrance on the part of the commanding officer, which I believe reached the Duke of Wellington, that a board of officers was ordered to assemble, who recommended that the troops should be immediately moved into the new barracks.

For many years the medical officers represented that the white trousers as worn by the Guards, which were always cleaned with pipe-clay, and used to be worn from the 1st of May to the 1st of October, whatever the weather might be, were a source of disease; but the representations went for nothing till just before the late war broke out, when the men were at length put into cloth trousers all the year round. In the same way we protested year after year against the white waistcoat, or fatigue jacket, which was made of very loose serge, and the men were allowed to wear it in

Dr. T. G.
Balfour.

17 July 1857.

*Dr. T. G.
Bulfour.*
17 July 1857.

the barrack-yard at all times. I have seen them in a cold morning in the month of February at drill in the barrack-yard with the fatigue jacket on; notwithstanding many representations on the subject it still continues to be the authorized dress, and is still cleaned with pipe-clay, which I believe to be very injurious. The only thing done was that last year a very considerable improvement took place in the quality of the serge, and it is less objectionable now than before.

9551. (*Sir J. Clark.*) Do not you think that the state of our barracks is often sufficient to generate fever?—I think so; I have no doubt that the deficiency of ventilation is a very common cause of fever among the men. (*See Appendix, No. LXV.*)

9552. (*President.*) Can you suggest any remedy for the state of things which you have described, as to the difficulties with which medical officers are beset when recommending sanitary improvements?—I think, if it were laid down in the Queen's Regulations as the duty of a medical officer to offer suggestions in writing to his commanding officer, whenever he saw any means of promoting the health of the men under his care, that would have the desired effect, provided the commanding officer were also ordered, in the event of his not agreeing with the medical officer, or not carrying out his wishes, to forward the representations, with his reasons for not adopting them. They should be sent to the general officer commanding the district at home, or to the general commanding the troops, if in the colonies; and if the general did not adopt them, he ought then to transmit them in duplicate, one copy to the Commander-in-Chief, and the other to the Minister of State for War, stating his opinion on them, and his reasons for not acceding to the recommendations, and in that manner the authorities at head-quarters would be kept informed upon the subject. In the case of suggestions by the principal medical officer abroad, I think he should have power to consult with the engineer officer on all subjects, and if they could not agree as to the remedy, they should draw up a joint statement, to be submitted to the general officer; if he decided against the change, he ought to send home the whole of the documents, in the same manner as in the case of a regimental officer. I think that great advantage would be derived from following this course, which is nearly analogous to what was done in the case of the sanitary reports. When they were first introduced we found in many instances that general officers carried out sanitary measures before they sent home the complaint of the want of them, in order that they might be able to say that they had adopted the suggestions and done everything they could to preserve the health of the troops.

9553. (*Mr. J. R. Martin.*) Is it not the case that in our foreign possessions, notwithstanding the circumstance you mention, the defects remain very much what they were at the commencement of the present century?—No. During the last ten or fifteen years the defects have been in many cases removed, and in others ameliorated; but I think you would have a better chance of having the proper measures carried out, if you made it a part of the medical officers' duty on all occasions to represent them.

9554. It is an understood duty now, is it not, that he should report?—An understood duty is never well done—an ordered duty is.

9555. (*President.*) Have you any suggestion to make as to the pay and position of the hospital serjeant?—I think at present the pay and position of the hospital serjeant are very far from satisfactory, because, during the first seven years he is in the service, he only gets the same pay as a company serjeant, and the consequence is that all the best men are taken for staff serjeants, colour serjeants, and pay serjeants. The hospital serjeant generally is chosen because he is a quiet, steady, but rather useless man, and I think it is very desirable to place him, as to pay, rank, and pension, in such a position that it would be an object for the best serjeants in the regiment to compete for the appointment. I think that if the hospital serjeant were placed on a footing

with the quartermaster serjeant, as to pay, rank, and pension, you would then get exceedingly good men for hospital serjeants. It would be a very great improvement to give a medical officer a trustworthy non-commissioned officer to act under him.

9556. (*Sir T. Phillips.*) You stated that improvements have been introduced into the sanitary treatment of the army during the last fifteen years. Has that resulted in decreased mortality?—Yes; the decreased mortality was stated by Colonel Tulloch in his evidence.

9557. It is stated that the decrease in the mortality between the years 1830 to 1837, compared with 1837 to 1846, was from 21·6 to 20·4?—Yes, in the Foot Guards.

9558. Can you state whether the decrease has gone on since 1847?—I have, by direction of the president, applied for returns from the Foot Guards, from which I shall make up a statement, showing clearly whether there has been an improvement, and in what classes of diseases.

9559. I find, comparing the total deaths in the Foot Guards with the total deaths in the civil population of large towns, the difference is between 20·4 and 11·9, or a difference of $8\frac{5}{10}$?—Yes.

9560. You are aware that of the whole of that 8·5, 7·5 is represented by pulmonary disease?—Yes, it is.

9561. Bearing in mind that the great increase of mortality in the Guards, and in the army generally, is due to pulmonary disease, can you suggest to the Commission any cause that seems to you adequately to account for that disparity?—I think it is rather a combination of causes than any one; and I think that foremost among those, perhaps, you may put the over-crowding of barracks and the not ventilating them. I think the deficient ventilation of barracks has a very great deal to do with pulmonary disease in the army generally, and particularly in the Guards. They are quartered in a large town, and under those circumstances you ought always to have more cubic space for the men and better means of ventilation. I think another cause is the amount of night duty, which I have known to be very severe indeed in the Guards. At one time the men in the Tower had only one night and two nights in bed, alternately. I think that another great source of pulmonary disease among the Guards is the amount of syphilis, which I have not the least doubt, in men who have any predisposition to tubercular disease, is a very fertile cause of its being called into active operation.

9562. Would you state as your impression that the over-crowding of our soldiers is greater than the over-crowding of our working population in large towns?—The working population in our large towns are exceedingly over-crowded in some places, but in others they are not; if you go to the lowest class they are exceedingly over-crowded, but a little above them they are not so, nor have you them congregated in such masses in one room.

9563. Take your own experience of the effects of over-crowding on the civil population, are you able to say personally that it does not result largely in pulmonary disease?—I am not able to say that from personal observation, but I think when you get the working classes into large rooms well ventilated, as in model lodging houses, you find a great diminution in the mortality, and we know that the principal mortality of the country is from pulmonary disease.

9564. Are you prepared to state that that diminution has occurred now from improved lodgings?—Decidedly, there has been a decrease of mortality among the people occupying those lodging houses.

9565. Have you arrived at the conclusion that life has been of more value within the last few years than it was at the beginning of the century?—I do not think that one can come to that conclusion if you take it over the whole population, because model lodging houses have been carried out to a mere fractional extent, and not sufficiently to have affected the results upon the general population.

Dr. T. G.
Balfour.

17 July 1857.

9566. I think that over-crowding was the first reason you gave, and night duty the second?—Yes.

9567. And a particular description of disease was the third?—Yes.

9568. Looking at the remarkable contrast between the cavalry and infantry, do you apprehend that the influences which operate on the cavalry are so distinct as to explain the disparity?—I think they do to a great extent.

9569. Take over-crowding first?—I am not prepared to show that the cavalry are not overcrowded; but I think in a cavalry barrack you have more space for the men than in the infantry, from the regiment being smaller, and from the necessity of having greater space for stables.

9570. Take syphilis, would that more largely prevail in the cavalry service?—In the cavalry the amount of venereal diseases of all kinds is 206 per thousand, and in the Foot Guards it is 250 per thousand.

9571. That would not largely eventuate in pulmonary disease?—No; but it might assist partially to cause the difference.

9572. (*Dr. Sutherland.*) Are the cavalry regiments generally barracked in flights one over the other, or are they barracked along the top of the stables?—Very often they are barracked in flights, but the ground floor is the stable.

9573. How many flights are there in general in infantry barracks and in cavalry barracks?—I suppose about the same number of flights; I should say generally there is the ground floor, the first floor, the second floor, and sometimes attics.

9574. (*Sir T. Phillips.*) The soldier living over the stables is found to be an evil?—I never heard a complaint of it, they have separate entrances.

9575. Does the service of the infantry in the colonies at all tend to increase the mortality in the infantry as compared with the cavalry?—That would not be applicable to the Guards.

9576. Do you think it does as to the infantry at all?—I think it must affect them a little; there is a greater mortality at home from diseases of the liver, stomach, and bowels, among the infantry of the line than among any other troops. I presume that is very probably the result of colonial service.

9577. That would still leave a contrast between the infantry of the line and the Guards, and tend to render it still more inexplicable?—I think it would, with this difference, that in London the Guards have far greater opportunities of dissipation of every kind than the Line in country quarters.

9578. Are there any means of comparing the disease or mortality of the Guards when out of London and when in London?—Yes, there is a means of comparing the mortality of the Guards in Canada with the line in Canada, and it is very favourable to the Guards; the Grenadier Guards at that time had a great deal of outpost duty. The mortality of the regiments of the line in Canada during the four years from 1838 to 1842 was 16·5, whereas, the mortality of the Foot Guards in Canada during the same period was 14·5.

9579. Did that include deaths by violence?—Yes, it included all deaths.

9580. Did deaths by violence operate more upon the troops of the line than upon the Guards?—Yes; the difference was against the line 0·6 per thousand.

9581. Can you state the history of the scale of pay, when the scale of pay of the assistant-surgeon was settled at its present amount?—I cannot tell you that now, but I will put in a statement of the various rates of pay at different periods back to about 1550. (*See Appendix No. XIII.*)

9582. (*Mr. J. R. Martin.*) When you contemplate that medical officers generally are to report upon sanitary deficiencies, do you mean that all are alike qualified to perform such duties; does the state of

the medical department at any time warrant such a conclusion?—I do not think that all medical officers are alike qualified to report on sanitary matters any more than they are on matters of medical treatment. You have great diversity in the talents, in the qualifications, and in the common sense of medical officers; but I would call on every medical officer to report upon any point that he considered of importance to the health of the troops, and to suggest the remedies that appear to him best calculated to preserve it. I would leave to the higher authorities the carrying out of those recommendations or not according as they approved of them, always making them assign their reasons for not carrying them out.

9583. With all the superior circumstances affecting the profession in civil life, has it not been found a great advantage, nevertheless, to appoint special sanitary officers?—I think that is more required in civil life than in the army. In civil life you have a sanitary officer appointed to a large town, but I think that in a regiment the medical officer, if he understands his duty, ought to look upon the prevention of disease as far more important, both to the men under his care, to the country, and to himself, than the mere cure of disease. I would appreciate very much higher a medical officer who kept his regiment efficient, than one who was remarkably successful in the treatment of disease which had arisen perhaps from his carelessness, or from ignorance of sanitary science.

9584. All that being admitted, it is found that in the French army they separate the two—and they have councils of health under the direction of the Minister-of-War?—I was not aware that the two had been separated in the French army. I have an impression that you are mistaken as to their councils of health; for instance, in the field they are generally composed of the three senior medical officers with that army; or an inspector of hospitals is specially appointed to be the president of the *conseil de sante* with the two senior medical officers acting with him; but they are not solely reserved for sanitary investigations, as they have the inspection and the superintendence of the hospitals, as well as the supervision of the sanitary details.

9585. They are selected officers for all their functions?—Undoubtedly.

9586. (*President.*) Their functions include the prevention of disease?—Yes.

9587. (*Dr. Sutherland.*) It would not be inconsistent with the army sanitary service that there should be inspectors set apart for the express purpose of inspection, when an occasion arose, as in the case of the appearance of epidemics, an army taking the field, or general hospitals being established?—It would not be the least inconsistent, I think it would rather be a more full development of the system, that upon occasions of emergency or occasions of great expeditions you should appoint an inspector for that particular duty, because then the duty would be as much as any one man could take upon himself to discharge.

9588. (*Mr. T. Alexander.*) Generally speaking you would combine the inspecting officer with the sanitary officer?—I think I would generally combine them, except in the case of an army in the field.

9589. (*Sir T. Phillips.*) As to an army in the field, the value of the sanitary officer would be not so much as to the selection of a particular spot as the removal of all elements of disease?—I think he ought to be consulted on both, so far as strategical reasons would permit; you may often require to place troops in a very unhealthy position, to which the sanitary officer would object, provided the troops could be equally well placed elsewhere; but if it were imperatively necessary that they should remain there, then his attention would be directed to removing the causes of diseases.

9590. (*Mr. J. R. Martin.*) He should be the medical topographer of the army?—Yes.

The witness withdrew.

Adjourned till Monday next at Twelve o'clock.

Monday, 20th July 1857.

PRESENT :

The Right Hon. SIDNEY HERBERT, M.P.
A. S. STAFFORD, Esq., M.P.
Sir H. K. STORKS, K.C.B.
Dr. A. SMITH.
T. ALEXANDER, Esq., C.B.

Sir THOMAS PHILLIPS.
Sir JAMES CLARK, Bart.
J. R. MARTIN, Esq., F.R.S.
Dr. JOHN SUTHERLAND.

PRESIDENT, The Right Honourable SIDNEY HERBERT, M.P.

James Mouat,
Esq., C.B.

20 July 1857.

JAMES MOUAT, Esq., C.B. examined.

9591. (*President.*) What rank do you hold in the service?—I am staff-surgeon of the first-class, and local deputy inspector of hospitals, on half pay.

9592. Where have you served?—In India, the Mediterranean, and the Crimea.

9593. In the Crimea had you ever to create a hospital?—I was called upon to organize a hospital for the reception of the wounded in the field.

9594. Did you find any difficulties in so doing?—No difficulties on the part of the medical authorities.

9595. Did you meet with any difficulties on the part of any other department whose co-operation was necessary to you?—No intentional difficulties, but difficulties certainly such as might have been prevented by pre-arrangement.

9596. What things could you not obtain?—It appears to me that when called upon to organize a hospital of that kind, with no materials for building a hospital, that all the appliances necessary for the hospital ought to have been placed at my disposal, and as far as the medical authorities were concerned they were placed at my disposal; but I was called upon to make a hospital out of huts not intended for that purpose. I had no means of doing so. Two carpenters were placed at my disposal, but it was necessary to ventilate that hospital, and to put up shelves. All that should have been done by the engineer department, and should not have been left for me to do; that occasioned a considerable trouble, difficulty, and waste of time.

9597. Had you any difficulties as to the supply of hospital furniture?—None whatever as to furniture, there was a slight deficiency in two or three trifling things.

9598. At what period was this?—This was in the spring of 1855.

9599. Did you get beds?—Yes, everything of that kind was sent to me; but it was the conversion of buildings not intended for a hospital into a hospital, that ought to have been done by the engineers department.

9600. Your view is, that the medical officer ought to find all the material appliances for a hospital ready to his hand, and that he should only exercise his own professional duties?—Exactly so.

9601. Would you carry it further and say that the same thing ought to be done in peace, with regard to hospitals?—I think that hospitals ought to be organized into classes, and that a certain amount of materials of every description whatever, according to the different class of the hospital, should be ready, and there should be a list of them, and the medical officer should only have to apply for them and have them placed at his disposal, medicines, appliances, and everything; and that he should not be called upon to say how much do you require of this, that, or the other, but a fixed scale ought to be laid down and if he wants anything additional he should apply for it.

9602. There is an equipment now laid down, is there not, for a general hospital in war, or for a brigade or a divisional hospital, or even for a battalion?—I believe there is now, but I do not think there was at that time.

9603. At any rate, if it was laid down it was not producible?—I had to make special requisitions for nearly everything I wanted, and to carry them myself and get them counter-signed, and go direct to headquarters to save time. No difficulties were offered to my obtaining things, but when I applied for them I often could not get them.

9604. Did you apply direct to Sir John Hall?—Yes, through him, and he countersigned my requisitions, having satisfied himself of the necessity of them.

9605. What was your rank then?—Staff surgeon of the first class and medical inspector of this hospital.

9606. You had no deputy-inspector between you and Sir John Hall?—No. It was necessary to build a cooking shed and to fix boilers for the purpose. In order to fix boilers I required bricks. I made out a requisition for the bricks. I made a guess as to the quality. Without any difficulty the requisition was signed, and I was told, certainly you can have them. I rode down to Balaclava and I was there told I could not have them as they were wanted by another department, by the commissariat to make ovens, and I was thrown over. I applied again and the same thing happened. I wrote then a letter pointing out the difficulties I found in getting them, at which I expressed my surprise, for I was aware that other departments were able to get that which I could not get. Sir John Hall forwarded this letter to the assistant quartermaster-general, who replied politely in a note that bricks should be given, but that it was not in their province, strictly speaking, to supply bricks.

9607. (*Sir H. K. Storks.*) I suppose bricks are not quartermaster-general's stores, properly speaking?—That was the answer I received.

9608. (*President.*) Do you know what the practice in the Russian service is, as to the formation of hospitals?—As far as I could ascertain and remember from conversations, everything was done, in the shape of buildings, and everything connected with them, by the military department, the military medical equipment.

9609. Those instances have been instances in war?—Yes.

9610. Have you ever found in peace any difficulty in getting your recommendations attended to in regard to the construction of hospitals?—Yes, on two or three occasions.

9611. You served in India?—Yes, nearly ten years.

9612. Did you find a difficulty there in that respect?—Yes, there was a difficulty there.

9613. Can you give any instance?—Yes, I can. In the year 1844, I was in charge of my regiment, it had been a very sickly season, and we had lost a large number of men from dysentery, when the inspector-general of hospitals came round, I had some conversation with him on the subject, and I told him that I had drafted a letter which I should like to show him before I sent it. I showed him this letter, and he advised me not to send it. I asked him why, and he said in the first place it had been represented already, and next there had been already a great deal of representation on this subject with his predecessor, and he had received a hint we had better keep quiet, as if we gave the authorities much trouble, his (the inspector's) appointment in all probability would be abolished.

9614. (*Sir H. K. Storks.*) Was he in the company's service?—No, in the Queen's service.

9615. (*President.*) The threat came from the company's service, I presume?—Yes; and I did not forward the letter in consequence.

9616. (*Sir T. Phillips.*) What were the wants which you had to represent?—With reference to the sanitary position and locality of the hospital, and a suggestion was made that an experiment should be tried of removing a company from the hospital to another position to see whether the effect of removing this company would be satisfactory as an experiment; it was not done at that time, but it was done subsequently, and it turned out to be most satisfactory, that is to say the company when removed from their unhealthy locality lost only one per cent. per annum, while before they had lost seven and eight per cent.

9617. Your requisition was not for work to be done at the hospital?—No, simply a letter pointing out this and recommending that an experiment of this kind should be tried. This occurred eight or ten years ago, and I believe they have since come to the determination to build another barrack. These kind of representations had been going on for twenty years.

9618. (*President.*) To come nearer home, and to things which have occurred to you, you have been quartered in Ireland, have you not?—Yes.

9619. Did you ever know an instance of a hospital in Ireland without any lavatory for the men?—When the regiment in which I served arrived in Clonmel, there were no means of ablution for the men of that regiment—the 9th, eight hundred in strength, except two pumps in the open air, one for the hospital, and one for the men of the regiment. There was a little distance between them, and as soon as I discovered this, (we moved in winter, and the regiment was not very healthy.) I made a representation on the subject to the commanding officer, pointing out the danger of men exposing themselves. I had observed them in their shirt sleeves in the open air getting wet through. One man had to wait while another was washing. My commanding officer perfectly concurred with me. I pointed out that there were two or three unoccupied sheds, which at a very trifling cost could have been converted into ablution rooms. The commanding officer agreed with me, and he forwarded my letter to the major-general commanding the district. The answer that I received from the major-general commanding the district was to this effect, the lieutenant-colonel commanding the 9th regiment was directed to inform the surgeon that he was extremely surprised to learn that the men of that regiment were unable to put up with the same means of ablution which had served every other regiment quartered there before them, and I believe that the men in that barrack are pumping upon themselves to this day.

9620. (*Sir H. K. Storks.*) How long have you been in the service?—Eighteen years.

9621. Where did you first serve?—In India; the last eight years I was at home (except 18 months in the Crimea).

9622. Did you ever know a barrack eighteen years ago in this country that had an ablution room?—It was not the case formerly, I know, but for many years past they have been gradually used.

9623. I said eighteen years ago?—I am speaking of eight years ago.

9624. (*President.*) You were quartered in Galway, were you not?—Yes.

9625. Can you give any instance that occurred in the hospital there?—Yes, the hospital there in a sanitary point of view was situated in the most unhealthy part of the town,—in a densely crowded seaport town,—it is almost in the centre of the town. There are two barracks, the castle barrack and another. Nothing could be worse than this hospital; there were high walls all round it and no air could penetrate into it. One of those high walls was a public nuisance, it was a public cloaca for all the people in the neighbourhood, and various representations were made to the civil authorities and sometimes it was a little better, but it was impossible to keep it so without placing a sentry over it but that could not be done. It was so bad that erysipelas and other diseases prevailed, and I made a representation on the subject to my commanding officer, who agreed with me perfectly. I felt so satisfied about it that I would not have undertaken to perform surgical operations; a patient would not only have stood a bad chance of his life, but he would have died probably; the inspector-general of hospitals came down and looked at it, and I was told that a new barrack was about to be erected, and that a good hospital would be erected in connection with it; the hospital would be first erected, as I was informed, and it would take some years; this was some years ago, and it is not yet erected. I therefore thought it advisable in the mean time to provide a dwelling house which had been used as a cholera hospital admirably situated with a large garden round it at a trifling rent of 40*l.* a year. I suggested that it should be hired and used for the troops quartered in Galway until the new hospital was built, the commanding officer agreeing with me, and the inspector-general agreed with me; it was referred to the barrack department and it was thrown over.

9626. (*Sir T. Phillips.*) When was this?—Five years ago.

9627. (*President.*) Did you serve in the Crimea, down to the end of the war?—Yes.

9628. When you left, to what place was your regiment ordered?—I was not a regimental officer then.

9629. Do you recollect any instance in which an interference took place on the part of the commanding officer to prevent the medical officers accompanying a regiment?—I recollect an instance which was referred to me officially. When the 82nd regiment was ordered to embark, they were to proceed in a man-of-war, and it was found, that there was not accommodation for all the officers to proceed with it, and the commanding officer under those circumstances omitted two officers of the regimental staff, the dispenser, and one assistant-surgeon, sending one surgeon, and one assistant surgeon with the regiment—the surgeon did not learn this until they were just about to embark. He came to me, and made a representation, which I immediately felt it my duty to forward, with a remonstrance to the brigadier commanding, who agreed with me, and one medical officer was ordered to be substituted for an ensign, I think, but when the colonel learned this arrangement had been made, he wrote a letter to the general commanding, stating that his arrangement had been interfered with, and it was altered again, and the medical officer was left behind, in spite of my remonstrance.

9630. What was the result?—That the medical officer was left behind, and my remonstrance was not attended to.

9631. (*Dr. A. Smith.*) And the dispenser also?—Yes, the assistant-surgeon and the dispenser.

9632. (*Mr. A. S. Stafford.*) Did the regiment embark with one surgeon and one assistant-surgeon?—Yes.

9633. (*President.*) Their view was, that one ensign was of more importance than one assistant surgeon?—I presume so. The commanding officer seemed to think that the surgeon had no right to communicate

*James Mouat,
Esq. C.B.*

20 July 1857.

James Mouat,
Esq., C.B.

20 July 1857.

with me on the subject. I told him that it was the custom of the service, to communicate with the head of the department on professional points, more particularly when it was a remonstrance on any subject of duty.

9634. (*Sir T. Phillips.*) Where was the regiment sailing?—It was coming home. My instructions were from Sir John Hall. I was left in charge as principal medical officer of the army, on the embarkation of the remainder of the army, after the principal medical officer had gone, my instructions were that all regiments were to embark as complete as possible. I merely wrote to say, that as the whole regiment embarked, all the medical staff should accompany it.

9635. Where was the difficulty of providing an additional officer to go on board ship, with a regiment of men?—It was a man-of-war, and the accommodation was not enough.

9636. (*Mr. A. S. Stafford.*) What was the name of the vessel?—There is no difficulty in ascertaining it.

9637. (*President.*) Was it a two-decker or a three-decker?—A two-decker.

9638. Have you considered the question of the pay of medical officers?—I consider that the pay is quite incommensurate with their position and attainments.

9639. Do you object to the minimum pay in the first two years of the rank?—I consider the minimum pay in the first two years a peculiar hardship, and the more so as we were not led to believe, when the warrant was issued, that it was so intended. It is so worded that it is capable of a double interpretation, and it was interpreted against us.

9640. What warrant do you refer to?—I do not know the date of it, but it had reference to the minimum pay on attaining the rank of surgeon. I think it was the warrant of 1840. It appeared to be a boon, but in reality it was a positive injustice.

9641. (*Sir H. K. Storks.*) Will you explain what you mean by a double interpretation?—The warrant appeared to have this meaning: that if an officer had attained his promotion to the rank of surgeon before he had served ten years, he was to serve until he had attained ten years service on the minimum pay, whereas it appears, no matter when he obtained his promotion, if he obtained it after 12 or 14 years, he still had to serve two years. It bore upon me very hardly. I was within six weeks of ten years' service when I received my promotion. I imagined that I had to serve six weeks, instead of which I had to serve two years, minus six weeks. The warrant would lead you to suppose that when you had served ten years and received promotion you were entitled to 15s. a day, whereas you must, no matter when you obtain the promotion, serve two years to obtain the full pay of your rank.

9642. (*Sir T. Phillips.*) What was the date of your appointment?—1838.

9643. (*President.*) Do you propose to make any difference in the pay of the assistant-surgeons?—Yes; I would bring it up to 10s. a day.

9644. With an increase?—Yes, after five years' service.

9645. Of how much?—Of 2s. 6d.

9646. Have you made any scale?—No, I have not. I have here a paper which I suppose has been placed before the Commission, and I agree with it as far as the junior ranks are concerned. I do not pretend to offer any opinion upon the senior ranks.

9647. Upon the subject of retirement have you any suggestion to make. Are you in favour of compulsory retirement?—Yes; after a certain period of service.

9648. Service and age?—Yes, both; 65 is the maximum age, and 35 the maximum of service.

9649. After that the retirements should be compulsory?—Yes; whatever grade they may have attained at that time.

9650. I suppose you would make it compulsory either at 65 years of age, or at 35 years service?—Whichever may happen to be first.

9651. (*Dr. A. Smith.*) You would have a constant change in the senior officers in that way if you compelled every man of 35 years' service to go on half-pay?—Bearing in mind the habitual amount of foreign service, the chances are that most men will be more or less unfit for active duty after that period of service. I think that a large portion of foreign service adds to a man's age.

9652. (*Sir T. Phillips.*) You would make retirement compulsory under 60 years' of age?—Yes, if a man had served 35 years.

9653. (*Mr. T. Alexander.*) You would make retirement the same for both ranks; both for the executive and the administrative ranks?—I think that an administrative officer may remain longer than an executive officer.

9654. What period of service would you say for the executive rank?—I do not think that any officer could be an executive officer in the field after 60 years of age.

9655. (*Mr. A. S. Stafford.*) Do you agree with resolution 6, which is, that "retirement be optional after 21, and compulsory from regimental and second class staff surgeon duty from 35 years"?—Yes, I do, and that retirement may be optional after 21 years; I would make it 21 and 25.

9656. (*Sir T. Phillips.*) If you made stepping stones of five years would it not be convenient to make retirements of five years?—It is so much dependent upon a man's health. No two men are exactly alike, therefore I give those two periods of 21 and 25 years, and I would give him the option.

9657. (*Mr. T. Alexander.*) You would not give the same rate of retirement at 21 as at 25?—No; unless he retired from ill-health; if not from ill-health I should make a difference.

9658. Do you agree with the recommendation of the director-general that it should be $\frac{5}{10}$ ths. at 20, and $\frac{7}{10}$ ths at 25 years?—I have not made any calculation.

9659. (*President.*) As to relative rank you wish the relative rank of the medical officer to be substantive, so far as carrying with it the advantages that it gives to a combatant officer?—Yes, the real substantial and substantive advantages of that position, in every respect the same as the engineers and the other scientific branches of the army, without absolute military command.

9660. (*Sir T. Phillips.*) What do you mean by absolute military command?—The command of men on parade.

9661. What command of men is the surgeon to have?—I do not wish him to have any command; I said without command.

9662. (*Sir H. K. Storks.*) You mean relative rank?—Yes. I think that medical officers feel deeply the slight that the want of that right position exposes them to. I have heard a discussion in a mess-room whether it was competent for a medical officer, though they were nearly all boys but himself, to notice any breach of discipline, or even to put an officer under arrest; and I have known another medical officer pulled up for not doing it.

9663. (*President.*) With regard to funeral honours in the same way, would you extend them to medical men?—Yes. I can mention a most painful illustration of that, that took place in the Crimea. A medical officer, a staff surgeon of the first class, died, and it was my duty to make the necessary application to the military authorities for his funeral. I applied to the brigadier for the usual funeral party, the band and a firing party, and the commanding officer of the 82nd regiment not only refused his band, but refused the firing party also. Col. Robertson, I think, was the commanding officer's name. The brigade major was the channel of communication, and it went from him to the brigadier.

9664. Do you consider that promotion should be by seniority in the lower ranks, or by selection?—I think that up to the grade certainly of regimental surgeon and perhaps staff surgeon of the first class, the promotion should be by seniority.

James Mouat,
Esq., C.B.

20 July 1857.

9665. That would be an alteration from what it is now?—At present I believe it only extends to regimental surgeons.

9666. And to second-class staff surgeons?—Yes, they are the same virtually.

9667. Is it seniority upon the army list? Does every man go up in his turn?—I believe, for the convenience of the service, the man is usually promoted who happens to be the senior on the station.

9668. (*Sir T. Phillips.*) What is your proposition?—I think, if possible, it should be extended throughout the service. As it at present stands, the convenience of the service is consulted to the disadvantage of the medical officers.

9669. (*President.*) At present, the senior on the station is taken, in case of a death vacancy. The senior officer on the station gets the promotion. What you would do is, to assimilate the two, and take as a rule the present system under which a vacancy is made by promotion?—I think so.

9670. Do you intend to include the first-class staff surgeon in the seniority system?—Yes, I think it might be done.

9671. Is that rank one that is very important to be retained?—I consider that rank, or a substitute for it, is necessary.

9672. For what purpose?—There are certain appointments that can scarcely be considered as a charge for a deputy-inspector of hospitals; it would require an officer of an intermediate grade to perform those duties.

9673. Could not you make that officer an inspectorial officer?—I think that that is an objectionable kind of rank.

9674. Is the rank of a staff surgeon of the first class an executive rank, or an inspectorial rank?—I think it ought to be executive. They are generally men at an age at which they are not too old for those duties, but at present, as it is, I do not think that it is always so. I think that they are liable to be employed in both capacities.

9675. (*Mr. T. Alexander.*) Do you not think that rank narrows the field of selection for the higher grades?—Yes, it has that effect.

9676. (*President.*) There are not above 33 or 34 first-class staff surgeons for the director-general to select from?—I think that that rank or an analogous one should exist; I object to the title.

9677. (*Sir T. Phillips.*) For what purpose do you think that the rank ought to exist, assuming the number to be so small?—Unless an alteration is made in the present arrangements of the army, as long as there are recruiting districts, and districts where the duties are not very large, I think there ought to be an officer of an intermediate grade to perform that duty.

9678. What is the duty that you assign to a first-class staff surgeon?—I think that he ought to be an executive officer. In a large hospital he ought to perform operations, and he ought to take a certain number of cases under his treatment; I think it is very desirable that he should do so.

9679. For any other duty than the hospital duty is he necessary?—Yes, for recruiting districts.

9680. (*President.*) Is it not important that all inspecting officers should take a certain portion of professional practice to keep themselves up to the mark?—Not unless they are in charge of a hospital. I do not think it would work well for an inspector of hospitals to go into a regimental surgeon's hospital and take charge of some of his cases.

9681. I mean in his own hospital—in a general hospital?—Then I think it would be to his advantage. As it at present stands he is merely consulted; he is supposed to exercise a general supervision, and does often over the treatment of cases, but delicacy very often forbids him from actually interfering in them.

9682. Practically the supervision is more over the arrangements?—Yes.

9683. (*Sir T. Phillips.*) Is it not the case with the consulting surgeon in a hospital in civil practice that

he does not operate himself, but is consulted by the ordinary surgeon?—I believe that is the case in civil hospitals; the consulting surgeons are men generally who have retired; it is not the same in the army.

9684. (*President.*) In the balance for or against the retention of the rank, what would you say?—I would retain the rank or an analogous one, but I would alter the name, (I think the title is objectionable) and make them executive wherever they could be made so, and administrative only when it was absolutely necessary to make them so.

9685. In the rank above you would promote by selection?—Unquestionably.

9686. Has it ever occurred to you that the medical service would be stimulated by the hope of some rewards similar to those called good-service pensions?—I think it is only fair that a certain amount of good-conduct pay for meritorious service should be awarded to the medical service the same as to other officers in the army. If I were asked to say what were all the grievances of the medical department I would put them into a nutshell. I should say simply that they ought to be put on the same footing as other officers in the scientific branches of the army. Why should there be any distinction?

9687. Would you like to carry that throughout everything?—Yes. There are no doubt some points on which it would not be practicable.

9688. Would you put an assistant-surgeon on the pay of an ensign?—You could not view in that light, and for this reason:—There is this distinction—that medical officers have nothing to look to but their pay, but combatant officers, when they attain a certain rank, have no end of appointments open to them. A combatant officer may have the command of a station, but a medical officer on half pay can get nothing.

9689. (*Sir H. K. Storks.*) Would it be desirable that they should purchase their commissions?—I consider that the time at which they enter the service, and the expense of their education, are quite equivalent to the value of a commission. I have calculated that if I could have got into the service at a certain time, adding my pay and expenses, I could have purchased a majority—besides which, the purchase is only an investment. You can sell it again.

9690. You can sell your knowledge in private practice?—A few might. It is very up-hill work, a work of time. By the time that you had succeeded you would no longer be fit, perhaps, to practise.

9691. (*President.*) You wish to see good service pensions introduced?—I do.

9692. Could anything be given to stimulate study in the lower ranks, such as medals or scholarships, with a small payment, to be held for three, four, or five years, either for the best examination past, or the best case books?—That question requires a little consideration. I think it would be advisable (though I am not prepared to say exactly what it ought to be), to hold out some such inducement. I think a well kept medical register, with clinical remarks to accompany it, is a very good test of a medical officer's knowledge when you cannot see him personally; it gives you a good insight into his professional attainments, though I object to the registers as carried on in the manner that they are now, because a great proportion of them is literally a waste of time and money—they are not worth the price of the register.

9693. Why not?—Because they are filled up with trivial cases, such as gonorrhœa, and those cases ought to be kept in a tabular form, and all the really interesting professional cases should be entered, and the inspector of hospitals would be a proper judge of that.

9694. (*Mr. J. R. Martin.*) You would confine the real registers to the record of acute disease?—Yes, and the other in a tabular form—it is a mere waste of time. Still it is necessary to show in writing, that the medical officer has visited his patients every day.

9695. (*President.*) Do you propose any alteration in the roster for foreign service?—I think it would give

James Mouat,
Esq., C.B.

20 July 1857.

great satisfaction to the department, if there was a roster. It is one of the things that bears peculiarly heavily on the medical officers, the large proportion of foreign service they undergo. I believe it has been calculated that it exceeds every other branch of the service—it is generally 17 years and a fraction of foreign service out of 21.

9696. It is known to all officers when it will come to their turn, is it not?—I think that one can ascertain it by an application to the director-general.

9697. Did you ever serve at Chatham?—I was a probationer there some years ago; not latterly.

9698. Was not it the custom there that the roster was put up, showing the medical officers next in turn for foreign service?—Not when I was there. The officer next for foreign service was generally warned to hold himself in readiness, though I have known officers ordered to embark at 12 hours' notice.

9699. You have served in India?—Yes.

9700. Did you find that there was a sufficient number of Queen's officers, either staff or regimental officers, attached to the Queen's forces there?—I should say not. The number is sufficient, but there is generally such a large proportion away sick, that there is scarcely a regiment in which there are not Company's officers doing duty with it.

9701. (*Dr. A. Smith.*) The Queen's officers often become sick, and it is necessary to replace them with officers from the Company's service, are these easily obtainable?—Generally speaking, but they are very often of little use; they are sent there to learn their duty professionally. I do not consider that they are equal to the men that they replace; nine times out of ten the officer replaced may be a man of experience.

9702. (*Sir H. K. Storks.*) Are they equal to the assistant-surgeons who enter Her Majesty's service?—In point of professional attainments, certainly, but we get young men to replace them. I had one so inexperienced that he would not do anything without coming to me; he would not give even a dose of medicine.

9703. (*Mr. J. R. Martin.*) He was a probationer, was he not?—Yes.

9704. (*President.*) Do you get your fair share of appointments, do you think?—No; out of all the appointments that occur, I believe there are only three or four appointments which are open to officers in the Queen's army; there are one or two others which are not permanent, they are mere acting appointments, not equal to the charge of a native regiment.

9705. (*Dr. A. Smith.*) You do not mean a staff medical officer?—He is a regimental officer detached from his regiment for staff duty, which is objectionable.

9706. What duties do the superintending surgeons perform in reference to the Queen's hospitals in India?—They perform on the spot somewhat analogous duties to the inspector of hospitals, but, from their peculiar position, and a feeling of delicacy, they never interfered in any way excepting in the financial arrangements. I have only known one instance in which it took place, and that caused a great deal of annoyance and correspondence.

9707. (*Mr. T. Alexander.*) Do not you consider that a proper proportion of staff medical officers ought to be sent out to our own army in India?—Unquestionably it would give great satisfaction to the department generally; the troops prefer their own officers' services, and although they work very well together, still a man does not like an officer of another service to come and inspect him and look over him.

9708. (*Dr. A. Smith.*) At present there is no inquiry made into how the patients are cared for or treated in the hospitals of Her Majesty's regiments, except once a year, when the inspector-general goes round?—No.

9709. Do you consider that that is sufficient?—I do not.

9710. Do you consider that there ought to be some other authorities there that could, from time to time,

inquire into how the hospitals were conducted, and whether the patients appeared to be carefully and satisfactorily treated?—It would be to the advantage of the service if it was so.

9711. (*Sir T. Phillips.*) What would you suggest?—I would suggest a certain proportion of staff surgeons of the first class, with analogous rank to that of superintending surgeon.

9712. To perform inspectorial duties?—Yes; when the inspector-general of hospitals goes away from a presidency there is no one there, and you miss him; there is generally a *locum tenens*, a young officer in the service, and I have known him to be a very young surgeon indeed.

9713. (*Dr. A. Smith.*) At the present moment, when it will be necessary to form large dépôts to which the sick can be sent, what medical officers are likely to have the charge of those dépôts?—There is no reserve to draw upon for that purpose. You must take regimental officers away to do that duty, or place Company's officers in charge, and you would have to take away the assistant-surgeons, who would hardly have had experience enough.

9714. Do you consider that an assistant-surgeon should be placed with 500 men, in charge of a large hospital?—I think that that appointment ought to be given to an officer of higher rank and greater experience than even a regimental surgeon.

9715. What rank of officer ought to hold such an appointment, when large accumulations of sick take place, it will not be possible to form small detached hospitals over India, during the present commotion, therefore large hospitals must be formed in the districts?—I think it ought to be a staff surgeon of the first class, with the rank of superintending surgeon.

9716. (*Sir T. Phillips.*) There are no staff surgeons sent to India?—Not any, that I know of; I am quite sure, when the army took the field, the inconvenience arising from the want of such officers must have been severely felt; they were then termed field surgeons; we had none; whereas the duty required to be done was done by the Queen's regiments. The principal part of the fighting always falls upon the Queen's regiments, and the principal part of the duty as to the wounded.

9717. (*Mr. J. R. Martin.*) You feel the want of inspectorial officers?—Yes, in the field, for the field hospitals, there were none in the late war in India.

9718. (*President.*) Have you any other suggestions to make, as to the dress or uniform of the medical department?—I think it is advisable that there should be no cause of complaint on that ground, and that there should be as little distinction as possible, consistent with the proper recognition of the officers. When a medical officer holds relative rank, I think that he ought to have a proper dress, to secure him proper respect.

9719. If he were a field officer, you would give him a brass scabbard?—I was told by an officer at Aldershot, the other day, that he was ordered to take it off. Anything that is calculated to lower, or degrade the department, by any absurdity in dress, is bad; it is not pleasant to be obliged to wear undress appointments in full dress, it excites remark; at present, the regulations are constituted so that a medical officer in full dress wears the same belt always as in undress.

9720. (*Mr. T. Alexander.*) That is changed for the higher ranks?—I am not aware of it; I observed that I thought this matter, on a fair representation, would in all probability be changed.

9721. You would recommend that it should go lower?—Yes, I think so; I think that their full dress ought to assimilate to the others.

9722. As to the pouch and the sword?—Yes; a medical officer puts on an undress belt in full dress, which is not done in any other grade in the service.

9723. (*Mr. J. R. Martin.*) You would extend that to every grade of commissioned medical officers?—Yes.

9724. (*Mr. T. Alexander.*) Have military officers different swords and belts?—Yes, they have a distinction; they do not wear cross belts in undress, as they do in full dress.

9725. (*Sir T. Phillips.*) Having regard to the long period that a man may be in the rank of assistant-surgeon, and surgeon, where you do not propose any selection, have you any suggestion to offer, for the encouragement of merit in those classes of the service?—I have no special proposition to offer; I think it advisable that there should be some encouragement if the seniority system is adopted, as it will remove a great deal of stimulus to exertion.

9726. (*Mr. T. Alexander.*) Would you not recommend that after 20 years all surgeons should rank as surgeon-majors with the rank of lieutenant-colonel?—Yes, certainly.

9727. (*Sir T. Phillips.*) Have you any suggestions to offer that in your judgment would develop merit and promote exertion?—I know nothing but brevet rank and honours.

9728. To be conferred for special service?—Yes.

9729. Suppose a case of special demerit, how would you deal with that?—If a man's case is not amenable to the articles of war I think he ought to be told at once that his promotion is in abeyance in consequence.

9730. (*Mr. T. Alexander.*) You would have brevet rank to carry pay?—Certainly; I think that where a medical officer is called upon to perform the duties of a position above him he should receive the pay. In the Company's service when a man is called upon to do the duties of a position above him he invariably receives the pay.

9731. (*Sir H. K. Storks.*) You receive the pay when you are acting in temporary local rank?—That is gazetted rank; I mean that if you are put in orders with the army to perform certain duties, you have the duties to perform, but you reap no advantage. During the whole time that I was in the Crimea, with the exception of a small portion, I was performing the duties of the rank above me upon the pay of the rank below.

9732. A combatant officer does not get increased pay?—He does in all important posts. A major gets command allowance.

9733. But not increased pay?—But he gets command allowance.

9734. (*Sir T. Phillips.*) What is the case when a lieutenant commands a company?—He gets the company allowance. With regard to courts of inquiry, I think they should be mixed, and that the medical element, if it is purely a medical matter, should predominate.

9735. Is there any other point that occurs to you?—With regard to a court of inquiry into the conduct of a medical officer as it at present stands, he is judged by men of another rank.

9736. (*Sir H. K. Storks.*) Supposing a medical officer to be brought to a court-martial, would you make the majority of the court medical officers?—Only a proportion of medical officers; they are generally tried for breach of discipline. I only know one instance in the service where it was otherwise, and that was in Dublin; it was purely a military court.

9737. (*Mr. T. Alexander.*) How should they sit, according to the dates of their commissions, their rank and position?—I think that a medical officer should take his position according to his rank; I believe at present he would be the junior officer, which is an indignity, to say the least of it. With regard to special appointments at home and abroad, I think they ought to be limited to a specific period. Staff appointments, both at home and abroad, say five years, with the exception of the director-general's office, where the special duties require special qualifications.

9738. Do you not think that those qualifications might be learned in a few months?—No; every man is not adapted to it. And besides, there is the *lex non scripta*, which is not very easily learned.

9739. (*Mr. J. R. Martin.*) Would it not be better to make it five years, subject to renewal?—Yes.

9740. (*President.*) There is nothing more difficult to learn there than there is in the office of the quartermaster general or the adjutant-general?—From the little that I have seen, I should feel myself quite unfit for it.

9741. A new broom might be an advantage?—Yes. There is another subject, that of sick leave from foreign service; it is peculiarly hard upon medical officers at present. Why medical officers on their return home should not receive the same advantages as other officers, I cannot comprehend; but so it is. A medical officer comes home on sick leave, nominally for two years; but he finds that the moment he comes here it is cancelled, and the two years become six months, whereas the combatant officer walks about for two years whether he is well or not. With regard to ordinary leave, when the army returned from the Crimea an order was issued that all officers should receive three months leave, but the medical officer was told that he should have six weeks. Although he was in the Crimea the whole campaign, and he was a meritorious and deserving officer, his leave was cut down to six weeks, not from any disinclination on the part of anybody at the head of the department, but because it was said that the exigencies of the service required it.

9742. (*Sir H. K. Storks.*) What was the date of the special order issued, giving three months leave of absence?—It was a garrison order in Dublin, sanctioning applications for three months leave by all officers who had served in the Crimea.

9743. That would be a local order?—I do not know what it was. I know that the medical officer was told that he could only have six weeks.

9744. (*Mr. J. R. Martin.*) You think that that is of general application, and it forms one out of many disabilities?—Yes.

9745. (*Dr. A. Smith.*) Are you not aware that the medical establishment allowed for the army is not greater than is absolutely necessary; therefore almost all the medical officers are requested to be continuously at duty. Supposing you gave them that amount of leave, how would you supply the vacancies that would arise when medical officers had left?—I think that there ought to be a reserve for all contingencies.

9746. A larger establishment?—Yes. There is another case which I would mention, and I have less hesitation in doing so as it happened to myself. When a medical officer is on sick leave, and a vacancy occurs to which he is entitled, he finds that his promotion is stopped, but if a subaltern happens to be in a regiment and a vacancy takes place he finds himself in the next Gazette, and I cannot see why there should be any difference. I lost my health in the execution of my duty; I came home on sick leave to this country; I was then serving in the 4th King's Own Regiment, and shortly after my arrival (I was still sick, but better), I became the senior of my rank at home, and to my great astonishment I took up the Gazette, and I found that the next man to me had been promoted over me. I was annoyed and disgusted. I happened soon after to be at the station where the medical officer died; I got into the train and came off to London, and I saw the director general, and I ascertained that another man's name had gone in to him to be promoted, and he said that he could not help it: unless I was fit for duty he could not promote me. I said I should report myself as fit for duty. He said, "Very well; a medical board must decide that question;" and the medical board did decide that I was fit for duty at home but not abroad. Then that man's name was withdrawn and I got the promotion.

9747. (*Dr. A. Smith.*) Did a death vacancy occur in England?—Yes; and I got it ultimately, but only by remonstrance.

9748. Are you not aware that when you were home here on sick leave from India, you belonged to the Indian establishment?—No; my regiment came home at the same time as I did.

James Mount.
Esq., C B.

20 July 1857

*James Mouat,
Esq. C.B.
20 July 1857.*

9749. Are you aware now that the rule still exists that when a surgeon is on sick leave, if a promotion is to be made, that surgeon, though he may be the senior here, cannot get that promotion?—I believe that is the case.

9750. But that the Minister for War has consented that the surgeon, whenever he becomes eligible, if it is 6 or 12 months afterwards, for promotion, when a vacancy arises shall have his commission antedated and stand before the man who got the promotion first?—I have never seen any rule or order to that effect, though I know an instance in which that did happen.

9751. That being the rule, is there anything unfair in the government taking care to have efficient medi-

cal officers to fill situations immediately?—I think that the officer ought not to lose his promotion; he should be promoted still, although he remains sick.

9752. How otherwise is the government to supply medical officers for duty when they are immediately required?—I think it is punishing an officer because he has the misfortune to be sick.

9753. (*Sir T. Phillips.*) Not if his commission is antedated?—That is a different affair if he gets the pay.

9754. (*Dr. A. Smith.*) He does not get the pay, he gets the rank?—I think that he ought to get the pay if he gets the rank.

The witness withdrew.

The Right Honourable Sir JOHN McNEILL, G.C.B. examined.

*Sir J. McNeill,
G.C.B.*

9755. (*President.*) You have seen the evidence before this commission or a large part of it, have you not?—I have seen the greater part of it.

9756. You are the chairman to the board of supervision for the relief of the poor in Scotland, and in that capacity you have had the principal charge of a separate department?—Yes.

9757. What is the number of medical men and officials placed under you in that department?—The number of medical men I cannot state accurately from memory; I suppose from 900 to 1,000.

9758. That is one for almost every parish?—Yes, and in some parishes many. In a large town the parishes are divided into districts with a medical officer to each district.

9759. Has your attention been turned to the organization of the medical department of the army?—To a certain extent it has.

9760. Have you formed any opinion as to the comparative advantage of directing that department by means of a board, or a single director-general on whom the whole responsibility should rest?—Judging from my own experience I should say, that I should exceedingly regret to be without the assistance of my colleagues; I rarely sit down to my own board that I do not receive from them very valuable suggestions.

9761. Will you explain how your board is organized?—The board consists of nine members, three of whom are commissioners named by the Queen, of whom I am one; three are sheriffs of counties, named ex-officio. Whoever happens to be the sheriff of the county for the time becomes a member of the board. The Lord-Provosts of Edinburgh and Glasgow are also ex-officio members; and the solicitor-general for Scotland is an ex-officio member.

9762. Do the ex-officio members attend with the same punctuality as the others?—No, they do not; they do attend specially, if their attention is directed to any particular subject, but the sheriffs attend very regularly. I receive the most assistance from them.

9763. Are the powers of all equal?—Yes, except that as chairman of the board I have a casting vote in addition to my other vote. The usual number who attend at any board, except on particular occasions, is three or four besides myself.

9764. You find that the fact of having so many persons attending with you on the board does not diminish your efficiency, or diminish your responsibility, because, having the casting vote and exercising considerable influence upon them, you can carry any measure that you wish to see carried into effect?—I cannot say that it does not divide the responsibility. I hold that the other members of the board are collectively responsible with me for what is done. At the same time, the deference which they are good enough to pay to my opinions, I being the paid member of the board, who devotes his whole time to the work, entitles me to say that I have been able, probably on almost every occasion, to carry in the board such pro-

positions as I have had to make. But it has happened that I have considered it my duty to revise the propositions that I have made, and to consider the objections which were stated by my colleagues.

9765. Which had not occurred to yourself?—No.

9766. (*Sir T. Phillips.*) Presented to you by the deliberations of the board?—Yes, by the deliberations of my colleagues, on a proposition that I had previously deliberated upon without perceiving those objections.

9767. (*Mr. J. R. Martin.*) Such were the advantages of bringing many minds to bear upon the subject?—Yes.

9768. (*President.*) If you had to create a department for the government of the medical officers of the army, would you take a board in which, as in yours, each member had a vote?—Certainly not. I think it of so much importance that the responsibility should rest with one person in the management of such a department as the army medical department,—that I should conceive the best constitution of a board for that department would be this, that there should be, besides the director-general, at least two colleagues associated with him, who should have the power of expressing their opinions in writing, and minuting whatever was brought before the board, but leave to the director-general the authority to act upon his own responsibility, disregarding those objections, if he considered it necessary.

9769. Supposing you had in the medical department some subdivision of labour, in order to enable all parts of the duties to be thoroughly performed; that you had, for example, a statistical department, and a sanitary department within the medical board, the representatives of those two departments would be enabled to tender their advice to the director-general, and the director-general would accept it or not, as he thought best?—Yes, exactly so. I would consider it necessary to serve the purposes which I would contemplate in having a board, that the various opinions should be minuted. I may mention that that is the constitution of the government in Madras, and also in Bombay. The Governor of Bombay has a council, and so has the Governor of Madras, and the Governor-General too. The propositions are made to the council, and the members of the council are entitled to express their opinions; nay, they are enjoined to express their opinions, and minutes of those opinions are read in council, but it rests with the governor, after he has heard and seen those opinions, to decide for himself; he decides with the knowledge of those opinions, and in disregard of them if he considers it for the advantage of the public service.

9770. Are you aware that the constitution of the Board of Ordnance very much resembled that?—I was not aware of that fact, but it has appeared to me, from my observation of what occurred in India upon many occasions, and in this country, that such a constitution of a board has many advantages, and that, without dividing the responsibility, it ensures a fair discussion and consideration of every question, and a

record of all the objections which may be made to it by persons cognizant of the subject.

9771. (*Sir T. Phillips.*) Do not you regard that last reason as a very weighty one, the record of what has passed?—I consider that essential.

9772. (*President.*) If the director-general at present, when he is doubtful upon any point, orders a board of three or more officers to consider the subject, and furnish him with their views, does not that attain the same object?—No; I think that every question ought to be brought before the board, but that the director-general should not be tied up by the opinion of his colleagues.

9773. You have found in the cases that you have mentioned that you derived much advantage from hearing a question ventilated by your colleagues; if the practice had been for you not to meet in consultation, but to refer to them when you were in doubt, should you have altered their decisions?—Very many of them I should not.

9774. You attach great importance to the results of the friction of intellect between two or three men?—Yes.

9775. Would you propose that all matters should go before the board—matters of routine of every kind?—That is a matter of detail. I should say that all questions of considerable importance, all questions that can be regarded as affecting the welfare of the service, ought to be brought before the board; every change ought to be brought before the board.

9776. The detail of every department and sub-department within the medical department would be dealt with by the chief of the department?—Yes, you cannot overload the board with such details.

9777. (*Sir H. K. Storks.*) Is it essential that the director-general of the army medical department should be a medical officer?—I do not know that I should say that it is essential, I think it is desirable. I think that the service have too few prizes to deprive them of it.

9778. (*Mr. J. R. Martin.*) The board that you contemplate would supply a scientific council, and constitute a proper division of scientific labour?—It would not only answer that purpose, but it would answer the purpose of recording the grounds of decisions upon every point of importance, and that I think is one of the essential conditions.

9779. Constituting a permanent record of the proceedings?—Yes.

9780. (*Dr. A. Smith.*) Suppose 300 questions are submitted to the director-general and the board in one day; if he were to discuss each of those questions with the board, he would perhaps not conclude more than 15, and the others would be thrown over till the next day, when 300 more arrived, how would you provide for dealing with them?—I suppose the board that I belong to has as many questions put to it as any board, but those questions must be divided into classes. A vast number of questions come, the answering of which is a mere matter of routine. Others involve matters affecting the whole system of administration, and it would be the duty of an intelligent secretary to bring to the notice of the head of the department those questions which appear to him to be such as ought to go before the board and leave him to determine whether they are to come before the board or not. But in all questions of considerable importance I cannot imagine any man at the head of a board not desiring to have his own opinions discussed by persons competent to do so.

9781. With reference to the secretary, and the cases which he did not consider it necessary to bring before the board, who should decide those cases?—If they are questions of routine which have been previously decided,—if they are questions which have been put many times, and many times decided,—a precedent is established on which these would be decided also. If they are not questions that have been previously decided, and if they involve anything of principle in them I would have them brought before the board.

9782. Perhaps you are not aware that when there was a board of medical officers at the head of the medical department and a secretary, the secretary gradually began to withdraw everything from the board?—That was the fault of the head of the board. I would not permit that.

9783. If it is necessary to bring before a board all matters of importance, reduce them if you please from 300 to 100, that will necessitate, will it not, each member of that board reading long documents with reference to the question?—The course I pursue is this,—we meet once a week, and we dispose at each meeting of 100 questions or more; but in the interval papers come in and they are generally sent round to the members of the board, who habitually attend, that they may see them before they meet the board. It is my business to examine them and to be prepared to state the case to the board and to suggest some course to be pursued. I consider that my duty. It is then for the board to determine whether that course meets their approbation or not, or whether they have any suggestion to make for its amendment, or whether they object to it altogether.

9784. (*Mr. J. R. Martin.*) But matters of everyday routine you would leave to be disposed of as the habitual business of the board?—Matters of routine are disposed of by the secretary and myself in the course of the week, for I give daily regular attendance, and only those questions which it appears to me ought to come before the board are sent down to the board; those questions invariably include every one about which I have any doubt, and if I doubt whether it ought to go before the board it goes before the board.

9785. (*Dr. A. Smith.*) There is this case, the Commander-in-Chief or the Minister of State for War may send for the director general to consult him as to certain things—a long consultation takes place and long explanations are entered into; he is then required to return to his office and give in writing his opinion; in that case it would be necessary, if the board was to decide, that the whole of the matter should be officially laid before the board coming from the Commander-in-Chief, if it should be he who required an opinion, or from the Minister at War?—I can hardly think that necessary. I am under the orders of the Secretary of State for the Home Department; I have occasion to come to London and communicate with him about my business, and I return to my board and I give to them in detail a verbal account of what has passed or in writing sometimes, making it more easily intelligible by my verbal explanation.

9786. Upon that the board acts?—Yes, I am always prepared (I consider my duty to be so) to suggest a course to the board on every question, and it is for the board to accept or reject my proposition.

9787. (*President.*) Your own board is not the kind of board that you would propose for the director-general?—Not at all; I have no authority except that of the casting vote. In a board for the army medical department I would think it my duty, if I were in the place of the director general, to communicate to the board everything that I was not bound to consider confidential.

9788. In the case of the Board of Admiralty in England, the First Lord of the Admiralty is supreme, and he can insist upon any two lords signing an order, and if they refuse to sign it he can dismiss them. The secretary allots the business throughout all the different members of the admiralty, and he settles that which is mere routine, and he reserves for the First Lord anything of a confidential nature; the First Lord communicates with the government as to the steps to be taken by the government, and he either does or does not communicate to his board afterwards as he sees fit; that is more in the nature of the board that you would recommend?—Undoubtedly it is, but one of the objects that I would contemplate, one of the objects that I should desire would be to have my own opinions, in so far

*Sir J. McNeill,
G.C.B.*

20 July 1857.

Sir J. McNeill
G.C.B.

20 July 1857.

as it was possible, in so far as official confidence would permit, constantly discussed or examined, at least, by men who were competent to examine them.

9789. (*Mr. J. R. Martin.*) The average of the questions being scientific questions?—All questions involving principle or important considerations.

9790. (*Mr. T. Alexander.*) Were the regulations clearly defined and published for the guidance of medical officers, it would simplify matters greatly?—No doubt; but define as you will, and issue rules as you will, the head of the department, as I know from experience, having done the best I could to define, will always have a great number of questions put to him the answer to which is very often merely a reference to rules which had been overlooked and disregarded.

9791. As to your board you have rules and regulations laid down, have you not?—Yes, as stringent as we can make them.

9792. (*President.*) In self defence you have them?—I hold it to be the duty of men in one position to establish rules which shall be binding upon the board as well as upon those who obey its rules. I think that we are bound, where we have responsible servants, responsible to the public and to us, to let them know by what standard they are to be judged, if the rules are defective it is our fault, but if they fail to observe them it is their fault.

9793. (*Sir T. Phillips.*) As to the selection of a council, I do not understand you to mean a council nominated by the director-general, but a council nominated by the Minister of War?—Yes; I should presume that the government, if it resolved on such a constitution as I have suggested, would select the best men they could find to perform the duties required of them.

9794. (*President.*) What is your opinion upon the subject of promotion, as regards the comparative merits of promotion by seniority or promotion by selection?—I think that my observation would lead me to say at once, as a primary proposition, that a pure seniority of service will not do; if you carry seniority all through I do not think it will answer.

9795. (*Mr. J. R. Martin.*) Not in any scientific profession?—I do not think it will answer.

9796. (*President.*) The stagnation would be so great?—Yes; and the highest officers in your department would necessarily be past their work before they arrived at the rank.

9797. That is the system in the Indian medical rank, is it not?—It was when I knew it.

9798. Did it work ill?—It worked ill as regarded the senior portion; it worked ill as regards the constitution of the medical board; and it very often worked ill as to the superintending surgeons, who correspond to your inspectors. At the same time I must explain that it was not a seniority service as regards the advantages of the service, but only as regards promotion. The prizes in the Indian service are so numerous at civil stations and otherwise, which are given by selection, that it very often happens that promotion comes to an assistant surgeon when he would be very glad to let it go by; the rank becomes comparatively unimportant.

9799. (*Mr. J. R. Martin.*) The evils of the seniority system were not felt in the regimental classes?—It was not in those that it was felt, it was in the higher ranks that it was felt; it was where age, which is necessarily implied in seniority, disabled many men who were discharging most important functions.

9800. (*President.*) In those upper ranks, take the medical board, were they the three senior surgeons?—Yes.

9801. In consequence of these being taken by seniority and not by selection, did they lose that weight with the army, who found that they were not the ablest men?—Most undoubtedly.

9802. (*Mr. J. R. Martin.*) It never could happen that they should be the three ablest men?—I apprehend that there was sometimes one able man among

them, who gave a tone to the whole, but it often happened that there was not one able man among them.

9803. The government, feeling that to be the case, always took care to appoint an able man as the secretary?—I suppose they did; at all events it was very important that they should.

9804. (*President.*) You would admit a certain amount of seniority in the lower ranks?—I think so.

9805. But selection for all responsible ranks?—I think so. I do not object to promotion by seniority, up to a certain point, but when you come to administrative officers, you must select.

9806. When it is done by seniority, should you say that it should be a rule not to be broken, except in case of distinguished service in the field, so that every man should know exactly where he stood and what his prospect of promotion was?—I should hardly be disposed to limit it to distinguished service in the field. I think that the services of a medical officer ought to be considered on occasions, sometimes when he is not in the field.

9807. (*Mr. J. R. Martin.*) For high scientific distinction?—Yes, I would use the general term "For distinguished services upon particular occasions."

9808. (*President.*) You may say, that in the medical profession the distinction between peace and war does not exist, as it does among combatant officers?—Not to the same extent.

9809. A medical officer may be exposed to as much danger and responsibility almost in peace as in war?—To a certain degree, undoubtedly.

9810. (*Sir T. Phillips.*) You do not intend that the reward shall be for general merit or for general service, but for distinguished service on particular occasions?—If you are to take a man, so far as your seniority promotions are to be carried, out of his course, then I think you must show some distinguished particular services to justify that proceeding.

9811. (*President.*) Would you strengthen that by exacting that the reasons should be given in the recommendation to the Commander-in-Chief?—If what is suggested about a board took place, it would be a matter taken notice of at the board and minuted there.

9812. In speaking of seniority, you mean seniority in the rank, not too much complicated by sub-divisions, so that men should know really what their prospects by seniority were?—I am not sufficiently conversant with the subject to go into details.

9813. Have you read the evidence as to confidential reports?—Yes, I have.

9814. Have you formed any opinion on the subject? Yes, I have; and I could not help comparing it with the course that I have myself pursued in my own department. The course that I have invariably pursued is this:—I receive continually every week complaints and objections from members of parochial boards and others of the conduct of the medical officers, and the inspectors, and the various officers employed under the Board. The course I invariably pursue is this, a copy of the letter is sent to the man complained of before it is brought for consideration before the board. It is never so brought before the board until the answer of the man complained against can be put before it along with the complaint; that is the invariable course. There is another class of cases in which we do not pursue precisely the same course. For instance, a pauper complains of the treatment that he has received from the inspector or the medical officer; we do not then give up the name of the pauper who is subject to the authority of this man, but state the subject of the complaint and call upon the officer for his explanation; we invariably give up the name of a superior.

9815. Do you think, looking at human nature, which is the same everywhere, that that is the only course which can give satisfaction to those who are affected?—It is the only course that I would consent to adopt.

9816. (*Sir J. Clark.*) On sending the letter of complaint to the person complained of, and if he can

reply satisfactorily to that letter, you do not call him before the board?—We never call him before our board at all; if he does not give a satisfactory explanation, we send a commissioner or officer to investigate the case on the spot, and on his report we dismiss him, or retain him.

9817. (*President*) Have you had occasion to give particular attention to the sanitary arrangements of large buildings?—I have had occasion to give particular attention to the sanitary arrangements of poor-houses: all the plans are sent to us for approval.

9818. A poor-house bears a fair analogy to a barrack?—Poor-houses vary very much in size, from accommodation for 100 inmates to accommodation for 2,000 inmates.

9819. In those, have you any rules laid down with regard to the space to be allotted to each person?—Yes, we have; we have a minimum of space, which we never permit to be transgressed, whatever the pressure may be; but I must explain that the poor houses are almost never full, and that the poor-house ceases to be of much value as a test if it is full.

9820. You are generally enabled to scatter your pauper patients?—They have generally a much larger space than our minimum allowance, which is about 484 cubic feet.

9821. (*Sir T. Phillips.*) Is that for living or sleeping, or both?—No; 484 cubic feet is the space in the dormitories, but the persons who sleep in a dormitory are never in it during the day, if they are able to be moved.

9822. In the day it gets thoroughly purified?—Yes; the windows are opened and the bed clothes are all thrown back, so that the whole atmosphere of the place is completely renewed before they return to it. They are in the day-rooms, in the workshops, in the yards, and they are not permitted to enter the dormitory during the day.

9823. Have you recourse to any special means of ventilation?—Our parochial boards have tried various means of ventilation.

9824. Have you come to any conclusion as to what is best?—I have come to a very distinct conclusion that you must trust to the windows, and to perforations for ventilation. In a poor house it is very difficult to keep the ventilation open; you must put it beyond the reach of the inmates, who are always ready to stop up the openings if you will let them.

9825. (*Mr J. R. Martin.*) Natural ventilation being the most practicable?—Yes; the shafts have failed.

9826. (*President.*) Is there any different minimum for the hospital wards?—Yes; I cannot exactly tell you the space, but I should think it is at least double that in a dormitory.

9827. (*Sir T. Phillips.*) Do you make any difference as to the minimum space in large towns in the country at all?—I do not think we have. In large towns we have to deal with a very inferior class of poor-house, which existed before the board existed, and we make the best we can of them.

9828. (*President.*) Practically, without taking into consideration that very often the wards are not above two parts full in many workhouses, is the minimum exceeded per bed. Do you give a larger space?—We do not interfere to give a larger space; we permit no pressure of numbers to be put in which would reduce the space; but practically I suppose that there has rarely yet been a poor house in Scotland which was so full as to reduce the space to that minimum.

9829. Do you ever carry it upon a higher calculation than that minimum?—I do not think we ever have done so.

9830. (*Sir T. Phillips.*) Do you know the arrangements in Ireland?—Yes, but there are few people to go into them now. You may give a ward to each patient, almost.

9831. (*President*) I suppose you find a very considerable improvement in regard to ventilation and sanitary arrangements in the later workhouses over the first?—If I were to lay before the Commissioners

our poor-house plans, from before the time that we began in 1845 till now, you could almost arrange them, I believe, chronologically from looking at them; they have improved from year to year.

9832. Do you consider it important that sanitary knowledge should be employed in the most effective manner for the preservation and improvement of the health of the troops?—There can be no difference of opinion upon that, I think.

9833. You are aware of the enormous rates of mortality which exist among the troops, even at home?—I am aware of that.

9834. That it is as large almost as in any occupation known in this country?—I am not aware of any civil class in the country or any occupations in the country—any ordinary trades in which the mortality is so great as amongst the troops.

9835. In what manner do you consider that this improvement could be effected?—If you are to undertake the sanitary improvement, especially of the buildings in which the troops and the sick are lodged, you must do it by having recourse to the best sanitary advice that the country affords, wherever it is to be found.

9836. If the task was put upon you of immediately attempting to introduce those improvements in the existing barracks and hospitals belonging to the army, how would you set about it?—I would set about it by employing the best man the most knowing man in sanitary matters that I could get hold of, and I would send an engineer with him, and make him go round to every barrack and put it to rights.

9837. Would you join with him the medical officer and the barrack-master at the station?—Undoubtedly.

9838. And form them into a committee?—Yes; I think that there is no time to be lost; I think it is rather too much that our soldiers should be worse lodged than our paupers.

9839. And our prisoners?—Of them I know less.

9840. Is there any way in which you would propose to provide for sanitary arrangements further than you have mentioned?—I think that that is the way to do it; give men power to carry out the object which you contemplate and hold them responsible for doing it.

9841. You would make them an executive body?—Yes, within certain financial limits, without reference, and to an unlimited extent with reference and approbation; but it would be a great pity to send round such a body, and not to give them executive powers, within certain limits, at once—let them do what they can at once, and then the other things could afterwards be referred for consideration to the proper authorities.

9842. Would it be an advantage to have at some great general hospital, such as Fort Pitt, or such as Netley will be, for the study of the younger medical officers, models of the different constructions of hospitals and barracks, and to attempt gradually to fix upon such a plan which shall be universally adopted?—I have no great faith in perfectibility in that respect. I think that the advances of science are so rapid, you must always expect that the next generations will beat us; you cannot lay down a rule and say, that is the best.

9843. (*Mr. J. R. Martin.*) Not for permanence?—No; but take the best of them, that is of what we can produce now. I have no doubt that those barracks, which we consider so deficient, were considered very good buildings in their day, and the time will come when those buildings that we think very good now will be condemned.

9844. (*President.*) Your attention has been turned to the evidence that has been taken before the Commission upon the condition of the barracks and hospitals of this country?—Yes, it has.

9845. You would say, that they are very far behind the civil hospitals, and the accommodation given to large bodies of men in civil life?—Most undoubtedly. I have just stated that our paupers are better lodged than our soldiers.

*Sir J. McNeil,
G.C.B.*

20 July 1857.

Sir J. McNeill,
G.C.B.
20 July 1857.

9846. (*Sir T. Phillips.*) Do you construct work-houses on a uniform plan?—Not at all—it would be hopeless. Each parochial board sends a plan for our approval.

9847. They are arranged with regard to special exigencies?—Yes; they employ their own architect, and we take care that the architect does not mislead them into a wrong course.

9848. That he does not sin against what you regard as important for health?—Exactly so.

9849. (*President.*) Have you directed your attention to the questions of diet, especially of the soldier?—Yes, I have had occasion to direct my attention to the diet of our workhouses, and also in the Crimea I directed my special attention to the diet of the soldier.

9850. You laid down proposals for an improved ration for the soldier on field service?—I attempted to do so, but I was diffident of my own capacity. I therefore submitted the ration which I proposed in conjunction with my colleague, to the highest authority on that subject with which I was acquainted, Dr. Christison, of Edinburgh, and in the appendix to our report is a communication addressed to me by Dr. Christison upon that ration which we have suggested. It embodies exactly my own views, that is to say, I entirely concur in what Dr. Christison has said upon the subject, and with the permission of the Commissioners I will read extracts from Dr. Christison's statement, which will exhaust what I have to say upon the subject. After stating the proportions of food which are necessary to the health and sustenance of a man, Dr. Christison says, "If the above proportion between the two sets be maintained, the weight of real nutriment per day varies, for adults at an active age, between seventeen and thirty-six ounces; the former being enough for prisoners confined for short terms, the latter being required for keeping up the athletic constitution, or that which is capable of great continuous muscular efforts, as in prize running, and other similar feats. Dietaries ought never to be estimated by the rough weight of their constituents, without distinct reference to the real nutriment in these, as determined by physiological and chemical inquiry. Keeping these principles in view, and with the help of a simple table, it is not difficult to fix the dietary advisable for any body of men, according to their occupation. It is also in general easy to detect the source of error in unsuccessful dietaries. For example; any scientific person conversant with the present subject could have foretold, as a certain consequence sooner or later, of their dietary, that the British troops would fall into the calamitous state of health which befel them last winter in the Crimea. Soldiers in the field will be more efficient the nearer they are brought to the athletic constitution. But as the demand for protracted unusual exertion occurs only at intervals, the highly nutritive athletic dietary is not absolutely necessary. On the whole, from experience in the case of other bodies of men somewhat similarly circumstanced, 28 ounces of real nutriment, of which seven are nitrogenous or reparative, will probably prove the most suitable. Any material reduction below 28 ounces will certainly not answer; and under unusual exertion, kept up for days continuously, as in forced marches, or forced siege labour, the quantity should for the time be greater if possible." Then he goes on to observe, upon the two scales which we had given, one for the garrison, and one for the field,—“In both of these scales, the proportion of the two sets of principles is nearly as three to one. In both, the total quantity falls a little short of what appears the most advisable.” So that the ration we proposed in his estimation fell a little short.

9851. (*Mr. J. R. Martin.*) Though it was in excess of the standard ration of the army?—It was pretty nearly the ration of the army at the time when we left the Crimea. “In all other respects the dietary seems unexceptionably good. It cannot be said

“that the deficiency will certainly occasion ill health; but there is too little to keep up the strength and energy of the men in circumstances of unusual exertion. The following is an apt illustration.” I think it is important to read this to the Commission as it is an illustration of the effect of a deficiency of abundant diet practically illustrated in a way that puts the question in my opinion entirely at rest. “Some years ago when I was appointed to inquire into certain points relative to the management of the prison, there were several men employed at the pumps for raising water daily from the Tay for prison use; an occupation requiring much expenditure of muscular strength. These men were without exception compelled to desist when fed on 25 ounces a day. An addition of eight ounces of meat and six ounces of bread was found necessary, and then they all worked vigorously and cheerfully.”

9852. So that the great desideratum is to ascertain the labour value of the dietary?—Yes, where labour has to be done; but a man in idleness must have a diet too.

9853. (*Mr. T. Alexander.*) You are an advocate for the ration to be clearly laid down and in sufficient quantity to keep the troops healthy under all circumstances?—I am clearly of opinion that the efficiency of the soldier, which is much dependent upon his health, ought not to be left to the mercy of his own discretion. I think the true course is that the government should supply in all circumstances and in all places that which is necessary for the healthful sustenance of the soldier, and that the quantity and quality and description of the food should be varied according to the circumstances so as to maintain his health.

9854. (*President.*) You would make under that definition a difference between his ration in peace and in war?—Yes, between his ration when he was doing little and much work.

9855. (*Mr. T. Alexander.*) Under no circumstances would you leave it necessary for the soldier to buy any article of diet whatever?—I would give the soldier such a dietary as would make that unnecessary.

9856. (*Mr. J. R. Martin.*) That arrangement should be for peace as well as for war?—In all situations and circumstances.

9857. (*President.*) There being varieties in the amount of the ration would depend first upon the climate, and the material of the ration where he was placed, and secondly upon the amount of work that he was required to perform?—Yes, undoubtedly; but taking care when you do change an article of diet, that you supply a nutritive equivalent.

9858. In that way you would, by consolidating all the stoppages, get rid of an immense deal of confusion and difficulty in the accounts?—I directed my attention to that specially in the Crimea. I was instructed to inquire into the mode of keeping the commissariat accounts, and the confusion which I found arising out of the multiplicity of stoppages, the amount of labour in writing which it involved was something perfectly monstrous. I desired the commissariat officer who was in charge of that department to bring me the vouchers for one regiment, and he brought me the vouchers for one regiment, a very numerous one certainly,—the artillery,—which consisted of 348 half sheets of foolscap. I asked him for how long it was, and found that it was for one month, and to be repeated every month. I asked him what length of time it took him to make them out, and he said, “if I work hard, I can do it in 8 or 10 days.”

9859. (*Mr. J. R. Martin.*) Under such circumstances an accurate audit of accounts becomes quite impossible?—In the circumstances in which the army were placed in the Crimea, an accurate audit of accounts was obviously impracticable. What is necessary for an accurate audit of accounts, according to the present system of varying stoppages, is this:—Before you can settle the soldier's account you must determine how many days he has been doing duty on shore, how many days he has been in hospital, and how many days he has been on board ship receiving

spirits, and how many days he has not been receiving spirits, and so on. It is utterly impracticable to ascertain all those things.

9860. (*President.*) The practical result was, that it became necessary to disregard the regulations, and to make an equitable adjustment of the accounts of the soldier?—It became absolutely necessary at the War Department to cut the knot. It was impossible to extricate it.

9861. If you had a uniform stoppage, and the same amount of stoppage abroad and at home, would you extend that also to the hospitals?—I would.

9862. You would have no increased stoppage in peace for men in hospital?—No, I would not.

9863. Might not that lead to malingering?—I have heard of a great deal of malingering, and no doubt it does occur; but if you consider the poor house a sufficient test of destitution, and sufficient to drive an idle fellow to work against his will, while his material comforts and diet are better provided for in the workhouse, I do not see why you should not drive malingers out of an hospital upon the same principle.

9864. You think practically that you drive out the malingers from the workhouse?—I do.

9865. You think there is not malingering to any extent?—I think that there was a good deal of malingering during the peninsular war.

9866. I mean in workhouses?—There are very few people, two or three people, perhaps, in a workhouse, who resolutely remain there; those are idiosyncracies which you cannot very well deal with; but you do not legislate or regulate for the exception but for the rule.

9867. (*Mr. A. S. Stafford.*) You said that there was a good deal of malingering during the last war?—Yes; and if you look at the mode in which your army was recruited during the last war, I do not think that you need wonder at it, you had all the very worst characters in the country in your army, you recruited from a class of men who are very rare in the army now.

9868. You do not think that the abolition of the stoppage would lead to a bad soldier going into hospital to accumulate a balance of money?—No; I think if the man at the head of the hospital knows his work that cannot be carried to a great extent, but if he does not, it may.

9869. (*Sir T. Phillips.*) By the last war do you mean the war in the Crimea?—No; I believe there was very little malingering in the war in the Crimea, a little there may have been.

9870. (*President.*) Is it not just as between the soldier and the public, that when the soldier is not giving the service for which he is engaged, you should not give him the same amount of pay, and the more so as the public is charged with his cure, and is put to considerable expense?—If the sickness is his own fault that may be fair, but if he has incurred his sickness in serving you, are you to punish him for it?

9871. In war you have no hospital stoppage?—If a man catches cold at night at home on sentry, and goes to the hospital, are you to punish him for that?

9872. Could you establish two rates, and say to one man you come in gratis, the public will treat you as you got your illness on sentry; and to another man, you are ill truly, but that is your own fault?—I would not draw any distinctions. I think that the soldiers do their work in a way that entitles them to that indulgence. You are not to punish a man who has incurred his illness on duty, in order to catch a man who has incurred his illness by his own fault.

9873. (*Sir T. Phillips.*) A large proportion of cases, you are aware, occur from the dissipation of soldiers?—Yes, but do you imagine that by hospital stoppages you will put a stop to it?

9874. (*Mr. J. R. Martin.*) You only diminish the poor fellow's powers of indulging in his vices if he have any?—I do not think that you can do that; you drive him to lower vices at a cheaper price.

9875. (*President.*) You would maintain the consolidated stoppage of 8*d.* upon a man in hospital?—I say that one of the great objects is to get rid of the different stoppages, and that there should be a net pay, so that every soldier's account could be settled by the number of days.

9876. (*Sir T. Phillips.*) You know with regard to a labourer or a mechanic, that he is not supported during any illness with which he is afflicted?—No, neither does he get rations; you do not undertake his support, but you do undertake the support of the soldier, and you are bound to support him whether he is sick or well.

9877. (*President.*) Are you of opinion that it would be advantageous where you have large bodies of troops together, say in Dublin at home, or abroad at such a place as Malta or Gibraltar, to have general hospitals instead of the present system of regimental hospitals, under one roof, with a view to give the medical officers practice in conducting hospitals on a large scale?—I do think that it would be a very important improvement. I think that we cannot look at the experience of the last war without regretting that our medical officers had not had an opportunity of making themselves acquainted with the organization of military hospitals on a large scale. I think it is exceedingly desirable that the opportunity should be afforded them, and I have not the least doubt that they would make a good use of it.

9878. It is often said that the present system of regimental hospitals works admirably well, and that after all a general hospital is only a regimental hospital multiplied by so many figures, therefore there is no difference in practice, and therefore the man who can do the one necessarily can do the other?—We have practical proof that it is not so.

9879. (*Mr. J. R. Martin.*) Have not general hospitals usually been limited to the circumstances of war, and have they not always been found to be so great an evil that they have invariably ceased with the war itself?—I think that you are so wedded to the regimental system that you return to it as soon as circumstances permit.

9880. (*President.*) Is there not a disadvantage in removing soldiers from under the care of the medical men belonging to the regiment who are acquainted with all the circumstances, their disease and their constitution?—He may be in certain cases acquainted with them, it is possible, but what happens to every man who goes into a civil hospital? He goes under the charge of a medical man who has never seen him before.

9881. (*Mr. J. R. Martin.*) Practically has it not been found in general hospitals that the removal of a soldier from the supervision of the surgeon and his colonel or captain, and from the tending he received from his comrades has very much demoralized the man?—I have no experience of any such results. I should on the contrary very much doubt the advantage of having many comrades together in a situation of that kind; they are apt to club.

9882. (*President.*) Discipline is easier when the regimental tie is broken up?—Yes; besides that you have a multiplicity of officers.

9883. (*Mr. J. R. Martin.*) In the peninsular war the great hospitals at Coimbra and Abrantes were found to accumulate immense evils, both physical and moral, and were found to breed new diseases, and to render the cure of the old a matter of great difficulty?—Yes; but I am afraid they were very bad hospitals.

9884. And also in the time of George the Second?—Yes; I think we have mismanaged our general hospitals very much. If you look at the hospitals that we erected in this country at the time when those campaigns that you speak of were going on, can you wonder that the temporary general hospitals there produced such results, that is if our hospitals at home were so bad, our temporary hospitals must have been a great deal worse.

9885. Referring to all the experiences of the British army, would it not be a wise course on any

Sir J. McNeill,
G.C.B.

20 July 1857.

*Sir J. McNeill,
G.C.B.*
20 July 1857.

occasion of a foreign expedition to send home men as rapidly as possible?—That would depend on the distance. You could not very well send them home from China.

9886. But in countries where the sea board formed the base of operations?—It is a question of distance quite.

9887. (*Sir T. Phillips.*) I believe you recollect that the Duke of Wellington made arrangements at the latter part of the peninsular war for sending his sick to England?—Yes.

9888. (*Mr. J. R. Martin.*) Having experienced the evils of the two great hospitals I have mentioned?—Yes.

9889. (*President.*) As was done also from Turkey?—Yes.

9890. Do you look upon it in this way, that a man may be a very good regimental officer, and he may be told,—you understand the command of your regiment, you know that a brigade consists of three such; you will only have to attend to that; a division consists of three brigades, you will only have to attend to that, and therefore you will be a perfect divisional officer if you understand correctly your duties in your regiment?—No man can hold such language, nor can it be used as to the medical department. A man may be perfect in his regimental hospital, but perfectly unfit to conduct a general hospital.

9891. He would be beaten by the scale of it?—Yes, if you accumulate regimental hospitals, you have as many surgeons as you have regiments there, then you have so many hospital serjeants, and you have the attendants each devoted to his own particular section of men, but you have no general organization, and no possibility of carrying out a general system; besides you have no means of carrying out a general system of instruction, which I should look upon as one of the advantages of having a general hospital. You can have no clinical instruction in a hospital divided into regiments; you have no one man in charge, and no one man who knows what is doing everywhere. But if you throw all your men together into one general hospital, and have the whole conducted on that principle, you may make it, as I believe, a very instructive medical school, which a regimental hospital cannot be.

9892. (*Sir T. Phillips.*) As to civil hospitals, they have no such organization, each of the surgeons treats his own patients?—Each of the surgeons treats a certain number of patients.

9893. He treats them himself, and it is so with regard to all the officers of a civil hospital, however large it may be; there is no superior medical authority in the hospital, chargeable with the organization of the whole machinery?—No, but in the army, if you are to have a general hospital you must have such a man.

9894. He would be an administrative officer, rather?—Certainly.

9895. (*Dr. A. Smith.*) Are you aware that for some time past, we have been congregating regimental hospitals together, into the form of a general hospital, where every regimental surgeon treats separately his sick, but is superintended by a senior medical officer, not of a regiment, who dictates the general regulations for the whole of those regimental hospitals?—Does he dictate the treatment?

9896. No, but he goes through each of those regimental hospitals, looks at the treatment of each surgeon, and if he is not satisfied he probably suggests that another treatment should be adopted?—That approaches considerably nearer to the regulation of a general hospital, but in forming a general hospital there are many things to be considered, to give unity to the working of the whole; and you must be perfectly aware, that one of the difficulties of our medical officers, with all the zeal and anxiety that they had, was their want of experience in that form of organization, so that they had to acquire their knowledge.

9897. (*Mr. J. R. Martin.*) It was there that the deficiencies were the most marked?—Yes.

9898. (*President.*) You do not mean medically, but in all the appliances and the administration of the hospital?—Yes the administration.

9899. (*Sir T. Phillips.*) You do not mean that the treatment of disease is to be taken out of the hands of the surgeon executing professional duties?—I do not think that that is a necessary result; I think it is very desirable that there should be inter-communication between all the officers attending the sick in a hospital, and that the senior medical officer should know what they are all doing—then the result I should expect is this, that the senior medical officer seeing those men at their patients' bed-sides would be a much better judge of what they were made of, than he could become in any other way.

9900. Is it not the case in civil hospitals that the varying treatment of different professional men is one of the means whereby the scientific knowledge and treatment of disease is improved?—Unquestionably, if you cut it all down to one uniform system you can have no improvement, of course.

9901. (*Dr. A. Smith.*) Would you not say that the difficulties which the medical officers had to contend with in the East, arose principally from the circumstance that we had been so many years at peace that they had had no opportunity of seeing a general hospital?—I hope we shall be a long time at peace again, but I should like them in peace to see a general hospital at work.

9902. Suppose they do go there and do duty in those general hospitals, unless their attention is directed specially to the general arrangements they will see or know nothing about them?—I confess I should consider it one of the advantages of having such a general hospital that it afforded you an opportunity of instructing your regimental medical officers in that very department; you would make it your business.

9903. We do that now?—You would make it your business to exercise the regimental medical officers in the management of a general hospital, and make them thoroughly acquainted with the whole details of its administration.

9904. We have only two general hospitals, one at Chatham, and a small one at Dublin, and to those hospitals every officer of the department has been once or oftener, with a view that they should see how general hospitals were conducted?—If we are to judge by what occurred in the last war that experience was not sufficient.

9905. (*Sir T. Phillips.*) A large general hospital would give the means of instruction, and also give the director-general the means of selecting suitable instruments?—I think it would be most valuable, as affording good grounds for selection.

9906. (*President.*) You think that a great number of officers would be brought under the supervision of one man, who could therefore better form an opinion which was the best?—They would be brought under a competitive examination and I think that the senior medical officer in charge of such a hospital, having those men practising for some months under his charge, ought to be able to place them as you would horses after a race.

9907. (*Sir T. Phillips.*) Supposing you found at the head of that general hospital, a man peculiarly qualified for an organization, he would be the person probably to be selected in a case of difficulty and emergency?—I do not go further.

9908. (*Mr. T. Alexander.*) Are you aware that the French medical officers are anxious to have the regimental hospital system introduced into their service?—I think it is very probable; it may be desirable for the French when they have regiments detached to have regimental hospitals, which is the system in our army in peace. I do not see what other system would have answered as well; but the question is, whether, while you retain your valuable regimental system you are not also to instruct medical men in the general system.

9909. (*Mr. J. R. Martin.*) You think that we have devoted ourselves too exclusively to the regimental system?—I think that the regimental system is a good system, but a system that breaks down on certain emergencies.

9910. (*Mr. A. S. Stafford.*) You do not go to the entire abolition of regimental hospitals?—No; I say when you happen to have regiments collected, assume that you have your regimental hospitals under one roof, or where there are the means of doing so, instead of preserving there your exclusive regimental organization, you should have a general organization for the whole, which would be a model for all those men in the event of their being called upon to establish a general hospital at the place of operations, and to give clinical instruction also. I hold that in such a situation the senior medical officer would be able to give most valuable instruction without exciting the jealousies of the younger men about him.

9911. (*Dr. A. Smith.*) Would not this meet your view. At Aldershot we are preparing a hospital for the sick of 10,000 men, and we have adopted the Bordeaux plan of blocks. Each regimental hospital has a block, and they are altogether connected by one corridor. The cook-house is the cook-house for the entire of the regimental hospitals. The surgery is the pharmacy for the entire hospital; those patients being in a regimental hospital are like a series of wards of a general hospital, and the regimental medical officers attending them are like the medical officers of a general hospital. There is the principal medical officer, and a staff surgeon of the second-class for the superintendence and management of this hospital, so that it becomes very nearly the same as you suggest?—It approximates as nearly, perhaps, as the tenacious predilection for the regimental hospital will permit.

9912. (*President.*) You have had occasion to see a good deal of military camps in your life?—Yes; I have spent some 10 or 15 years under canvas.

9913. You have had occasion to see something of military hospitals?—Yes; I have had occasion to see something of the military hospitals of the European troops in India, and a good deal of the Russian hospitals, and something of the French military and civil hospitals.

9914. What would you consider to be the best organization for a general hospital, if we should have again the necessity of creating large general hospitals at the base of operations?—That is a question which I considered with all the care that I could give to it. I was brought into contact with the circumstances. I set out with the principle that a general hospital at the base of operations ought to be sufficient for itself.

9915. Independently of other departments, do you mean?—That it should contain within itself the means of supplying all its wants, and to arrive at that result I think it would be absolutely necessary to have some supreme authority in the hospital, who should command everybody who entered it, who should have powers commensurate with the wants of the hospital, and a responsibility commensurate with those powers. I would have at the base of operations a governor specially appointed for the hospital.

9916. And for nothing else?—Yes.

9917. Not like a commandant?—Not at all. I would separate the dépôt from the hospitals altogether. I would make him supreme in the hospital—as supreme as the captain of a frigate is on board his ship. I would permit him to do whatever he conscientiously believed was necessary for the welfare of the hospital. He should be the person to expend money, and no money should be paid without his permission; he would order repairs, and he would order supplies; but, as I suggested in respect to the medical board here, I would have with him a principal medical officer. I would have a person in charge of the attendants, and I would have a purveyor. Those men,—the purveyor, and the superior of attendants,—with the principal medical officer, should form a council with powers to make such suggestions and minutes as they thought

proper, but leaving to the governor the absolute power of acting on his own responsibility. I would relieve the medical officer entirely of all administrative duties, everything connected with the cleansing and charge of the wards of the hospital. I conceive, having myself a strong sympathy with the profession, that their true dignity consists in restricting themselves to their professional duties. I cannot conceive that the dignity of a medical officer is augmented by directing the duty of a scavenger or a chambermaid; I would release him from everything of that sort. Everything should be done to his hand, and he should have the power to demand everything that was necessary.

9918. You would not allow to the governor the slightest right of interference with the medical treatment of the patients?—No. I would not allow that.

9919. You would not object to his being a medical officer?—No; but he should not exercise his profession in the hospital.

9920. Would you prefer a military or a medical officer?—On the whole I think I should prefer a military officer.

9921. You would require a man of some rank whom you could invest with great powers, and who would not be afraid to exercise them?—Yes, I would have a man picked for his qualifications.

9922. (*Sir T. Phillips.*) There would probably be less jealousy on the part of the medical men?—Yes.

9923. (*President.*) This is exclusively for a general hospital at the base of operations?—Yes, exclusively. If you were to provide what you have had in all your wars, a great general hospital at the base of operations, you require for it some organization different to what we have ever had before.

9924. You want to prevent three or four departments whose co-operation is necessary, from having no referee immediately above them, except the Secretary of State, who may be 1,000 miles away?—Yes. Give this man the whole power to do what he considers necessary to have the hospital in perfect order, and hold him responsible.

9925. (*Mr. J. R. Martin.*) Having placed him there you would regard him as the most important executive officer in the country?—I should hold him to be supreme within the limits of his command within the hospital, with power to expend what was necessary for the efficient treatment of the sick, and responsible for all the expenditure.

9926. You would regard him as the most important medical officer in the army?—In a certain sense he might be so regarded.

9927. And next to him the regimental-surgeon?—The principal medical officer in the hospital would be, in the medical department, the principal officer.

9928. (*President.*) Would not the duty of ordering everything be the duty of the purveyor?—Yes; but I think the purveyor ought not to have licence to order without the cognizance of the governor.

9929. Do you consider the scale is too large in a general hospital to be entrusted to the purveyor?—If we were engaged in war, suppose a hospital was to be established at the base of operations, which would probably be the port of disembarkation, or near it, the first step I would take would be to send the best sanitary man that I could get, and send with him an engineer, and I would set to work and select the buildings which were to constitute the hospital and put them in a proper condition as to drainage, sewerage, and ventilation, and everything that was practicable. If there were more buildings than one it should be done as to all; and, having done so, the Secretary of State should name the governor of that hospital, the principal medical officer who was to take charge of it, the purveyor and the superintendent of attendants, which I consider a very important officer, for the relief of the medical officer, and let the purveyor send in his lists with the cognizance of the governor, before he leaves this country, for all that is required for the supply of this hospital. Let the superintendent of the attendants do the same, and let

*Sir J. McNeill,
G.C.B.*

20 July 1857

Sir J. McNeill,
G.C.B.

20 July 1857.

the principal medical officer in communication with his apothecary do the same as to his supplies, and then before the men go into the hospital they will have everything in it they require.

9930. You mentioned, as one of the persons whom you would put in possession of considerable authority, the chief of the attendants?—Yes.

9931. You are aware that there is a hospital corps called the medical staff corps, do you mean that there should be some one of that body to be at the head of them and responsible for their conduct?—I do not know the constitution of that body sufficiently to determine whether they contain the elements necessary to make such a selection from, but I would place in charge of the attendants some one who could maintain discipline, to whom the medical officer should say that the attendant of such a bed had neglected his duty to day, and the superintendent of attendants should be responsible for the discipline of his own corps.

9932. Would you have a man with rank like that of quarter-master?—I would have a man of such rank as would enable him to maintain his authority.

9933. The hospital serjeant would not be a man of rank enough?—No.

9934. That is what you would do in the case of a general hospital at the seat of war; should the same organization, barring the governor, run through the hospitals at home?—I should think so.

9935. You would place more responsibility then upon the purveyor, who would become the commissariat store-keeper of the hospital?—Yes. I have not given the same attention to the organization of hospitals at home.

9936. Would you make any distinction as to the supply to the general hospital at the base of operations, and the field hospital in the front?—The field hospital in the front must be mainly supplied by the commissariat.

9937. (*Sir T. Phillips.*) With regard to the purveyor of the general hospital at the base of operations, should he be a commissariat officer?—I do not care whether he is or not, but he should purchase all that is necessary for the hospital.

9938. Is it likely to be as successful to have the purveying for the hospital cast upon a separate department, who should have to purchase corn, bread, and meat, as it would be to let that work be done through the commissariat, the obligation being on the commissariat?—I object to the obligation to supply the hospital being cast upon the commissariat. If you employ a commissariat officer you must detach him exclusively for the purposes of the hospital.

9939. (*Mr. J. R. Martin.*) Would you have a separate commissariat exclusively for the service of the hospital?—I am indifferent upon that subject.

9940. (*Sir T. Phillips.*) Supposing an army in the Crimea, and you wanted to supply cattle and corn, the commissariat would probably have to go to Asia Minor to sweep the markets, would you send the purveyor to buy corn and meat?—I would make the purveyor buy for himself and not have him rely entirely on the contracts of the commissariat, and for this reason that he buys different articles; he buys a better quality of meat, and he probably buys a better quality of bread. You want to give to your sick better things, and you allow a higher price.

9941. You would send him into the market to buy what he required, however distant the market might be?—I do not think it would be necessary to go to distant markets.

9942. Would you supply him with vessels at his own command?—No; I do not know any case in which at the base of operations it would be necessary to go to a distance for cattle or for supplies of any kind; it is when you leave the base and advance from it that that might be necessary.

9943. Would you give him a waggon train?—I would give the governor the power of making requisitions upon the land transport corps for transport for the hospital, and if convenient let it be given; if

not, I would give him power to hire land transport sufficient for hospital purposes on the spot.

9944. (*Mr. J. R. Martin.*) The advantage of the purveyor's department, I think, is, that owing to the limited sphere of his duties, he is able to rely upon and obtain better materials for his hospital than the average of the commissariat supplies?—Undoubtedly he is allowed to give a higher price, and he ought to get a better article. I see great inconvenience in the commissariat making contracts for cattle at different prices; the commissariat would have to buy for the hospitals at one price, and for the army at another; that would complicate the operations of the commissariat very much, whereas if the purveyor bought, it would be, I think, in the vicinity where the general hospital was, and it would happen that the purveyor would make contracts not only for the purchasing, but for the feeding of the cattle.

9945. You are aware that in India the commissariat of the hospital is a branch of the general commissariat? Yes, but I think the other is the better system.

9946. (*President.*) In the case of field hospitals and the medical department with the army in the front there ought to be a portion of horse transport permanently attached to them; you would not trust to requisition in cases where they were wanted?—Horses and mules would be daily required, but it would rest with the person in charge of the land transport corps, to determine whether they should be distributed daily or how it should be done: it is impossible to lay down a rule for that.

9947. If an army is spread over a wide line of country then it would be impossible to allot your horse transport by a daily requisition?—It would not be daily requisitions. There should be a certain number of mules for the carriage of a particular hospital, for the carriage of the sick, and for the hospital tents, and hospital stores, to put them on the ground on which you encamp. A question then arises—are they to remain with the regiment, or to go to the brigade park, or to the division park, or to the general park? That would depend upon the distribution of the army, and upon the discretion of the officer at the head of the land transport corps, but he would assign daily, say the next morning, the same number for the march, and send that number of animals to each regiment. There are many cases in which it would be much for the advantage of the service that the officer in charge of the land transport corps should have the power of accumulating those animals in divisions or in a great park, all under his own supervision, he would have his own people always with them; if you detach those persons belonging to the land transport corps to a distance from the officer who is their superintendent, they become demoralized, and not only lax, but they are tempted to be lax, and they are asked to do twenty things that they ought not to do. I would accumulate them under the charge of some responsible officer, either a brigade officer or a divisional officer, according to the circumstances.

9948. Would it ever be possible to relieve the commanding officer of the army of the charge of the general hospital at the base?—That would depend very much upon circumstances. For instance, if it had happened in the last war that the army instead of going to the Crimea had entered upon a campaign in Bulgaria, passing through Wallachia and Moldavia, and gone up into Bessarabia, I think that circumstances might have arisen in which it would have been far more convenient that the communication of the general hospital at Scutari should have been with home and not with the head quarters. I should contemplate their separation where a general officer thought it expedient that they should communicate with home rather than with him.

9949. Is not this likely to arise,—that the general officer commanding the army in the front has his whole attention fixed upon their health and their success, and he will always keep the best medical officers there, the men behind being to him compa-

relatively immaterial, and is there not a chance of the hospital at the base being neglected in favour of the army in the front?—Yes, naturally so; and for that reason I would have a responsible governor at the general hospital; I think that the hospital at the base without such a man is left in a hopeless condition; you must have a man whom you can trust.

9950. Who shall represent the Commander-in-Chief?—He should represent every authority.

9951. You stated, in speaking of boards, and of the governor of a hospital, that advice tendered to him by medical officers should be in writing, and be recorded with his reasons, if he rejected it?—Yes.

9952. Would you extend that principle to the medical officers, with regard to divisions and brigades; and upon the question of taking up sites for encampments, would you make it imperative on the medical officer to give his opinion, allowing the general officer to reject it if he thought fit?—I would make it imperative on the medical officer to tender his opinion; if you do not do that, it would probably be considered impertinent. If the medical officer, as a sanitary officer, tenders his opinion to the commanding officer, he has acquitted himself of his duty, but I would require him also to send to his own professional superior a copy of the report that he made to his commanding officer; that would come home to the medical department here, with the observations of the senior medical officer upon it; and that would enable them to assist the government in determining whether what was proposed by the medical officer was right or not.

9953. That would extend to all questions relating to the food and the hygiene of the troops?—All questions affecting the health of the troops.

9954. Would you appoint, in order to relieve the principal medical officer of the army of any additional duty over and above that which he has already weighing upon him, a separate sanitary officer, and attach him to the quartermaster-general's staff, or to the principal medical officer's staff?—Undoubtedly; I think it very important; I think it is of the greatest importance that you should have the best sanitary advice that can be obtained, for the quartermaster-general's department; for instance, in the selection of houses, and all that is in the quartermaster-general's department, the selection of ground for encampments, the disposition of troops in different buildings, the means of correcting existing defects in existing buildings, and all those sanitary questions. I do not see how, in the present condition of sanitary knowledge, you are to deprive the army of that advantage; I think it is unjust if you do.

9955. When you speak of a sanitary officer, in civil life sanitary study has become a speciality; hitherto that division of labour has not taken place in the army medical department, how would you propose to instruct army medical officers in those specialties, and, pending the time when you would have a large body of them available for service, how would you bridge over the interval?—There is only one way of bridging over the interval, and that is to take the best men you can get, wherever you can find them; that is only just to the soldier.

9956. You could not perpetually do that; you could not deprive the medical department of their prizes when once they are instructed; how would you instruct them?—You must get up a school, it does not exist, and it is properly the duty of the government to get up a school; if there were a school in civil life medical men connected with the army would take advantage of it, but there is none and you must establish a school.

9957. (*Mr. J. R. Martin.*) It is a matter now of special study to special persons?—Yes.

9958. (*President.*) You could do it at Netley, could you not?—Yes, undoubtedly.

9959. And you would make every officer go through a course of sanitary study?—Yes; and you must attach some value to proficiency in that course.

9960. You must reward it by making appointments?—Yes.

9961. (*Mr. J. R. Martin.*) An officer of health, as contemplated by the president, would be in fact the medical topographer of the army?—It would be his duty to represent any danger that would result from taking up any particular ground, and it would be for the military authorities to determine whether that danger ought to be encountered or not.

9962. (*Sir J. Clark.*) Every medical officer is an officer for hygiene, every medical officer ought to be acquainted with hygiene, and it would be merely for the head of the department to select those men who had paid more attention to that subject than others?—I do not pretend to offer an opinion as to the time that it would take a man to learn it. I believe, comparing the army medical officers with the great bulk of officers in civil life, the army medical officers are as well or better acquainted with hygiene than the great bulk of men in civil practice. At the same time I am bound to admit that I think there is a long interval between the knowledge possessed by the medical service of the army and the knowledge possessed by those gentlemen who have made it their special study.

9963. But it is the duty of every surgeon in the army to study hygiene?—Yes, I think it his duty to study it; I think that you are bound to afford him the means of studying it efficiently, and if you do that you will have among the army medical officers as distinguished sanitary officers as any country can produce.

9964. (*President.*) I think you hold the opinion with regard to attendants in hospitals and as to the selection of hospital serjeants that they should come from the ranks and not be a part of the medical staff corps?—Yes, I think that you should make the situation of hospital serjeant a prize to a good soldier.

9965. You would pay him as you would a quartermaster serjeant?—Yes. I would select the best man and make it worth his taking; you have no more important duty for a serjeant to perform.

9966. Would you remove him from all military control?—He should be the hospital serjeant, and he would be amenable to the medical officer for the time being. I would not preclude his future promotion; I do not think that your quartermaster-serjeant has more important duties or requiring higher intelligence than your hospital serjeant has.

9967. (*Sir T. Phillips.*) Is the pound of meat that you suggested in your report a pound of raw meat?—Yes.

9968. Your attention has probably been directed to the large amount of disease and mortality in the army as compared with that in civil life; has it been specially directed to the fact that the excess arises mainly in one class of diseases?—No.

9969. If you take the entire mortality in the Guards at 20·4, and the mortality in civil life in large cities at 11·9 you get an excess of 8·5. If you take one class of diseases, namely, pulmonary affections, you will find that in the army the deaths are 13·8, and in civil life 6·3, so that, of the entire excess of 8·5 you have 7·5 referable to one special class of diseases. Has your attention been directed to any explanation that can be given of the development of disease in that special direction?—No; but I am not surprised at the excess of mortality in the army.

9970. (*Mr. A. S. Stafford.*) Why are you not surprised at the excess of mortality?—When I find men crowded in barracks and hospitals in the way that they are, I cannot be surprised.

9971. You think that that is almost sufficient to account for it?—That, taken along with other causes, I look upon as almost a sufficient reason. If you took men in civil life and shut them up in a barrack in the same way, and kept them in their room all night, I have not the least doubt that you would have an increased rate of mortality.

9972. (*Mr. J. R. Martin.*) You regard defective ventilation as the great cause?—Yes, defective ventilation, because I do not think it is possible, packing men as close as you do, to give ventilation that would be satisfactory. I think you must give

Sir J. McNeill,
G.C.B.

20 July 1857.

them more space. I think that greater space is necessary whatever be the amount of ventilation.

9973. (*Sir T. Phillips.*) Has your attention been directed to the fact that the mortality in the cavalry is not much in excess of that in civil life?—Yes. If you look at the space allowed to the cavalry it is about double what the infantry have.

9974. Do you regard the fact that the cavalry soldier has more employment as a conservative element in his case?—I think that the cavalry soldier having exercise for his arms and the upper part of his body, may to a certain extent tell; the infantry soldier has his hands pinned down the greater part of the time he is on parade, and he has very little use of his arms. I think that is a disadvantage to him.

9975. Do you think that the circumstance, that until lately the height of the Guards was greater, at all explains the increased tendency to pulmonary affections?—I am not sufficiently acquainted with the statistics of mortality to answer that question.

9976. (*Sir J. Clark.*) Your opinion is that the chief source of disease in the army is the crowded state of our barracks?—I do think so; when I find so obvious and certain a cause as that, I feel very great difficulty in assigning other causes, for that appears to me to be of itself sufficient to account for it. It would certainly account for an excess, but

The witness withdrew.

Dr. John
Sutherland.

Dr. JOHN SUTHERLAND, further examined.

9981. (*President.*) Am I right in thinking that there is a published letter of yours to Lord Shaftesbury, in which you state that the sanitary recommendations made by you had all been anticipated by the army medical officers on the spot?—In reply to your question, I have to state that the letter to which you refer was written on the 19th of July 1855, and was printed in the "Times," and that it contains no expression of my opinions such as you have mentioned. I have introduced into it sanitary remarks on three places, Scutari, Balaklava, and the Camp. With regard to Scutari, there is not even a hint of my having had any knowledge of any recommendations having been made. In regard to Balaklava, I do not allude to any recommendations but our own. But with regard to the camp, there occurs a passage which I shall read; but as you will see it refers solely to the camp:—"It is also very satisfactory to state, that almost every practicable improvement we have advised for the camp, we have found already in operation in some part of it. We have only wished the worst practices to be avoided, and the best systematically adopted. But in doing this, all depends on the commanding officers of the regiments, and hence different regiments show different degrees of improvement. We have also found the medical officers thoroughly alive to the nature of the changes required, representing them to the authorities, but without power to carry them out." "These two facts appear to me to point out clearly, that military hygiene should be a portion, and a compulsory portion of the education and examination for service of every officer, whether medical or not, entering the service. If it were inculcated as a duty, that the main end of official routine is not only discipline, fighting, and treating disease, but also preserving the troops in a state of efficiency, I believe that a vast deal of the loss of life in armies would be avoided." Referring to our instructions I proceed to say,—"We have made every needful inquiry and recommended the adoption of all necessary measures. We have had the most needful of these measures carried out under own inspectors, and those in the camp are being carried out by the military authorities, charged with their usual execution. You are aware, however, that in all sanitary matters unremitting care is required to ensure con-

whether for the whole of the excess I do not pretend to say.

9977. Would that account for the amount of consumption that there is in the army?—In a great degree, taking it together with the night-work which the men have to do.

9978. (*President.*) Do you attach much importance to night work, when it appears that the mortality of the troops, who serve but two hours at a time and one night in four upon sentry duty, is very much higher than that of the police, who serve eight hours continuously for seven nights in the week?—I am quite aware of that circumstance, but I am aware that the police live a great deal better than a soldier does. The soldier issues suddenly from a heated guard-room to stand or pace slowly at his post; the policeman has a wider range, and can move at any pace necessary to keep him warm.

9979. (*Sir T. Phillips.*) Of what value to the public service is the ordinary sentry duty of the soldier, which appears so injurious to himself?—I think, that to the soldier it is of more value than to the public; you must give something to soldiers to do, in which their discipline is called into exercise, or you will not keep up their discipline.

9980. (*Mr. J. R. Martin.*) The duties of a sentry on service are of the most vital character?—The safety of the army depends upon them.

tinued success, and that any relaxation may do mischief. The measures themselves, moreover, are of such a nature that only those daily administering them can fully know what is done and what is undone; and hence the necessity for the examination in hygiene I have referred to. Without that no mere external pressure, such as we have exercised, can be of lasting benefit, because the parties who have to carry them out have no knowledge of their necessity or importance, and hence I have heard the most useful suggestions coming from military medical officers, called 'doctors' crotchets,' and thrown aside." In connection with this passage, I would beg to quote the following from page 125 of the Sanitary Commission Report. In the section as to the camp before Sebastopol we state,—"In pointing out the remedies, we considered it to be most advisable to recommend improvements we found already in operation in some part or other of the camp, on the very obvious principle, that what had been done successfully in one regiment might be readily done in another. This course was always taken; and where we found that something further was required to be done, we endeavoured as far as possible to limit our requirements to what was barely necessary." Permit me to add that in considering the evidence given by me at the last meeting, in reply to Sir John Hall's remarks on the sanitary commission, it has occurred to me that some expressions in it might appear to reflect on the army medical service generally. I am most desirous of avoiding the very appearance of this, and I must therefore beg that any critical remarks of mine may be understood as applying as I intended them, solely to imperfections in the sanitary system, which ought not to be charged against the medical service, and in no sense to the service. I have had abundant opportunities of estimating the zeal, devotion, and I would add heroism of the army medical officers in the field; and I have more than once expressed in this room my high esteem for this portion of the public service; I hope, therefore, the object of my remarks will not be misunderstood, and that the practical result of our labours here on their behalf will be to remove every reasonable cause of complaint on the part of medical officers, and to make the service as efficient in every point as possible.

Adjourned.

ANSWERS to WRITTEN QUESTIONS addressed to Miss NIGHTINGALE by the COMMISSIONERS.

9982. Have you, for several years, devoted attention to the organization of civil and military hospitals? Yes, for thirteen years.
9983. What British and foreign hospitals have you visited? I have visited all the hospitals in London, Dublin, and Edinburgh, many county hospitals, some of the naval and military hospitals in England; all the hospitals in Paris, and studied with the "sœurs de charité;" the Institution of protestant deaconesses at Kaiserswerth, on the Rhine, where I was twice in training as a nurse; the hospitals at Berlin, and many others in Germany, at Lyons, Rome, Alexandria, Constantinople, Brussels; also the war hospitals of the French and Sardinians.
9984. When were you sent out to the British war hospitals at Constantinople? We arrived at Constantinople on November 4, 1854.
9985. What hospitals did you find occupied there by the British? Two large buildings on the Asiatic side, near Scutari, viz., a Turkish barrack and a Turkish military general hospital, both of which had been given over by the Turkish government for the use of the British troops.
9986. How many patients did they contain at that date? The barrack contained 1,500, the general hospital 800 patients, total 2,300.
9987. By how many nurses and ladies were you accompanied? By 20 nurses, 8 Anglican "sisters," 10 nuns, and 1 other lady.
9988. Where did you take up your residence? We were quartered the same evening in the barrack hospital, and two months afterwards, a reinforcement of 47 nurses and ladies having been received from England, we had additional quarters assigned us in the general hospital, and later at Koulali.
9989. How long did you reside in those hospitals? Till the evacuation of Turkey by the British, July 28, 1856.
9990. Did you visit the hospitals in the Crimea? Three times. I *visited* the regimental hospitals; I remained in the general hospitals about six months.
9991. For what purpose did you visit the Crimea? Each time to place or to reinforce nurses in the Crimean general hospitals. The first time, for the general and Castle hospitals at Balaclava; the second, for the Castle and Monastery hospitals; the third, for the two land transport general hospitals, for which nurses had been "required" by the principal medical officer of the army in the east.
9992. Was that purpose effected? Yes; although difficulties sometimes interrupted the work.
9993. To ascertain the efficiency of the sanitary or medical organization of the army, it should be tested by its results in peace and in war? Certainly, in both.
9994. What tests under those two conditions exist, and are available for our instruction, particularly in reference to the state of war? The barrack, and the military hospital exist at home and in the colonies as tests of our sanitary condition in peace; and the histories of the Peninsular war, of Walcheren, and of the late Crimean expedition, exist as tests of our sanitary condition in the state of war.
9995. Is it necessary that you should refer at all to the hospitals of Scutari, or to the Crimea, as inquiries on these subjects have already been instituted? We have much more information on the sanitary history of the Crimean campaign than we have on any other. It is a complete example—history does not afford its equal—of an army, after a great disaster arising from neglects, having been brought into the highest state of health and efficiency. It is the whole experiment on a colossal scale. In all other examples, the last step has been wanting to complete the solution of the problem.
- We had, in the first seven months of the Crimean campaign, a mortality among the troops at the rate of 60 per cent. per annum from disease alone,—a rate of mortality which exceeds that of the great plague in the population of London, and a higher ratio than the mortality in cholera to the attacks; that is to say, that there died out of the army in the Crimea an annual rate greater than ordinarily die in time of pestilence out of sick.
- We had, during the last six months of the war, a mortality among our *sick* not much more than that among our *healthy* guards at home, and a mortality among our troops in the last five months two-thirds only of what it is among our troops at home.

The mortality among troops of the line at home, when corrected as it ought to be according to the proportion of different ages in the service, has been, on an average of 10 years, 18·7 per 1000 per annum; and among the guards, 20·4 per 1000 per annum. Comparing this with the Crimean mortality for the last six months of our occupation, we find that the deaths to admissions were 24 per 1000 per annum; and, during five months, viz., January—May, 1856, the mortality among the troops in the Crimea did not exceed 11·5 per 1000 per annum.

Is not this the most complete experiment in army hygiene?

We cannot try this experiment over again for the benefit of inquirers at home, like a chemical experiment. It must be brought forward as a historical example.

9996. Will you now state as nearly as you can how many sick and wounded soldiers were received in the hospitals which you have named at Scutari?

From August 1854 to May 1856, about 29,000 are said to have been admitted at the two hospitals at Scutari above mentioned, to which a third and smaller one was added, the palace of the Sultan at Haida Pacha near Scutari, also two ships for convalescents in the Golden Horn at Constantinople, a very small hospital for the artillery stationed at Pera, and a ward over a cavalry stable at Scutari. A large number of cases also went to the hospitals of Smyrna, Koulali, Abydos, and Renkioi.

9997. What was the prevailing character of the diseases?

During November, December 1854, January, and half February 1855, they were scurvy and diseases of the scorbutic type, viz., diarrhœa, dysentery, frostbite,* rheumatism, such diseases as generally arise from bad food, deficient clothing, fatigue, exposure, and damp.

During the latter part of February, March, April 1855, the scorbutic type declined; and diseases of the malarial type, typhoid, continued and remittent fever, dysentery, diarrhœa, and cholera began to prevail—to a great extent the result of bad drainage, bad ventilation, overcrowding, nuisances, organic effluvia, malaria, and damp.

9998. Did it appear to you that many diseases were induced, and others were aggravated in those hospitals?

Typhus attacked both sick and well in hospital. During the month of November 1854 alone, we had 80 recorded cases of hospital gangrene. Out of 44 secondary amputations of the lower extremities, 36 have died. Cholera broke out frequently both among sick and well. Also, there were frequent relapses of fever and diarrhœa, and the wounded suffered much from both, and, having come in for wounds, they frequently died from fever or diarrhœa.

9999. How many British soldiers died in those hospitals during the period of your residence?

About 4,600.

10,000. Can you state the number of deaths, month by month, in those hospitals; and the maximum of deaths on any one day?

The following is the head roll of burials at Scutari, not including civilians:—

November, 1854	-	368	October	-	-	46
December	-	667	†November	-	-	25
January 1855	-	1,473	December	-	-	7
February	-	1,151	January 1856	-	-	4
March	-	418	February	-	-	4
April	-	169	March	-	-	3
May	-	76	April	-	-	2
June	-	49	May	-	-	1
July	-	63	June	-	-	0
August	-	60	July	-	-	1
September	-	47				
						4634

The greatest number of burials on any one day was on Jan. 25, viz., 71. On Jan. 26, it was 70. The burials took place, as a rule, within 24 hours of the deaths.

10,001. You had the best opportunities for observing the condition of the soldier when he entered the hospitals; while he resided in them; when he died and was sent to the cemeteries; when he was sent home an invalid, and when he rejoined the army?

Yes; I was never out of the hospitals.

* The cases called frost-bite, were, according to their own account, contracted under circumstances showing no sufficient reason, in the degree of cold, for the effect. They should rather have been called gangrene, from a scorbutic tendency, aggravated by cold.
† This does not include the mortality from cholera in the month of November 1855, in the German Legion and Osmanli Horse Artillery (which were then quartered in the Barrack Hospital).

10,002. Will you describe briefly his condition under those various circumstances?

(I.) The sick, from the landing in the Crimea September 1854 to the end of January 1855, were brought to Scutari in 56 transports, some of which were sailing vessels and others steamers.

The sick were received on board, and sometimes detained for several days before the vessel sailed. The voyage for sailing ships was usually six days, and for steam ships under two days, but the average time the sick were detained on board was eight days and a half from the time of their embarkation at Balaklava till they were disembarked at Scutari. The numbers which died on board are variously stated, but they are probably in every instance understated.

It appears that about 13,093 sick were embarked during the four months and a half, of whom about 976 died. This is a mortality of no less than $74\frac{1}{2}$ per 1,000 in the short space of eight days and a half. Had the embarkation of sick gone on for 12 months and the same high rate of mortality prevailed among them, the proportion of deaths would have amounted to 3,182 per 1,000. In other words, the population of the sick transports would have perished on the Black Sea upwards of three times.

The following table gives the monthly details of this catastrophe.

ARRIVED AT SCUTARI.

MONTHS.	Sick embarked arriving at Scutari during the month.	Died on Voyage.	Deaths per 1,000 embarked.	Deaths per 1,000 on cases treated at Scutari.
1854				
Sept. 15-30 -	3,987	311	78	
October -	567	15	26.4	
November -	2,981	162	54.3	
December -	2,656	226	85	
1855				
January -	2,902	262	90	321*
	13,093	976	74.5	198†
February -	2,178	41	19	427
3 weeks ending Mar. 17. }	1,067	5	4.7	315
Ending Apr. 7	860	4	4.6	144

On a voyage no longer than from Tynemouth to London there died 74 out of every 1,000 sick embarked during four months and a half. The loss in individual transports was much greater than this average. The "Caduceus" embarked 430 sick September 23, 1854, and disembarked the survivors at Scutari September 29. During the six days the sick were on board there died no fewer than 114 men, being $26\frac{1}{2}$ per cent. of the total number embarked, or in the ratio of 16,160 per 1,000 per annum.

Either these sick transports were in a state utterly unfit for sick, as regards overcrowding, ventilation, cleanliness, and attendance; or sick were shipped in a condition utterly unfit for such a voyage. Of cholera cases, those who lived to arrive at all often arrived in a state of collapse only to die.

The superficial space, allowed in these transports, was fixed by a board of inspection, formed at Balaklava, December 12, 1854, at 6 feet by $2\frac{1}{2}$ feet for sick, and 6 feet by 3 feet for wounded men. The height between decks varied from 6 to 8 feet. One vessel only had a height of 9 feet in some parts, and one a height of $8\frac{1}{2}$ feet.

* Viz., from Jan. 7 to Jan. 31, 1855, † Oct. 1, 1854—Jan. 31, 1855.

(II.) During February, it will be seen that the mortality among the cases from the Crimea declined. The per-centage of mortality upon those embarked on board the transports fell from 90 to 19 per 1,000. But the mortality at Scutari rose, viz., from 321 to 427. And, even during the three weeks ending March 17, when the mortality on board the transports, which had been, from September 15, 1854, to January 31, 1855, above 74 per 1,000, fell to under 5, the mortality at Scutari still maintained its fatal preponderance, and continued at 315 per 1,000, half as much again as it had been for the four months, October 1, 1854, to January 31, 1855, which was 198.

(III.) The burial-ground at Scutari was overcharged, and sanitary precautions were not sufficiently observed.

(IV.) The adjutant's table below gives the numbers of men sent home for the months of

October 1854	-	-	-	-	90
November	-	-	-	-	302
December	-	-	-	-	559
January 1855	-	-	-	-	507
February	-	-	-	-	489
March	-	-	-	-	1,120

It will probably be inferred from this that there were, at first, no sufficient arrangements for relieving the hospitals of invalids, who consequently took up accommodation required for sick; invalids not likely to return to duty are those for whom transport is required. (Upon the sick, removal may have a doubtful result.) It is a well-known fact that, had it not been for sources of private supply, these invalids would have been badly off for clothing, going home.

(V.) The destitution of the men rejoining their regiments, of whom so many had lost their kits, would have been great, had it not also been for sources of private supply. It is well known that they arrived in hospital during the first part of the winter with "little or no clothing." I have seen men brought in with nothing on but an old pair of regimental trousers, not their own, a dirty blanket, and a forage cap. In December 1854, a quartermaster-general's store, for supplying the men going out of hospital with clothing, was established. But it was still found necessary to supply the men with some articles from private sources, upon requisition from the medical officers.

10,003. To what do you mainly ascribe the mortality in the hospitals? To sanitary defects.

10,004. Will you now state what the rate of mortality was? And how you have calculated it? I have calculated it, (1.) on the cases treated; (2.) on the sick population of the hospitals.
I beg to put in a Table.

AVERAGE of Weekly States of Sick and Wounded, from October 1st to January 31st, deduced from those given by R. W. LAWSON, Deputy Inspector General, Principal Medical Officer, Scutari.

Date.	No. of Days.	Sick Population of the Hospitals (mean of Weekly Numbers remaining).	Cases treated (mean of admissions and discharges including Deaths).	Deaths.	Mortality.	
					Annual rate per cent. per annum on the sick population.	Per cent. on Cases treated.
1854. Oct. 1st to Oct. 14th	14	1,993	590	113	148	19.2
" Oct. 15th to Nov. 11th	28	2,229	2,043	173	101	8.5
" Nov. 12th to Dec. 9th	28	3,258	1,944	301	121	15.5
" Dec. 10th to Jan. 6th (1855)	28	3,701	3,194	572	202	17.9
1855. Jan. 7th to Jan. 31st	25	4,520	3,072	986	319	32.1
	123	3,140	10,843	2,145	203	19.8

February 1855.

Hospitals.	Sick Population.	Cases treated.	Deaths.	Rate of Mortality per cent.	
				Annually on sick Population.	On Cases treated.
Scutari and Kululi - - -	4,178	3,112	1,329	415	42·7
Kululi alone - - -	648	581	302	608	52·0

STATISTICS of the BARRACK, GENERAL, PALACE, and KULULI HOSPITALS on the Bosphorus for periods of 21 Days, commencing February 24th and ending June 30th 1855.

Time.	Sick Popula- tion of the Hospitals (mean of Numbers re- maining at beginning and end).	Cases treated.	Deaths.	Mortality.		
				Annual Rate per cent. per Annum on the Sick Population.	Per cent. on Cases treated.	
1855.						
February 25	and the 20 fol- lowing days.	3,779	1,621	510	235	31·5
March 18		3,306	1,650	237	125	14·4
April 8		2,803	1,190	127	79	10·7
April 29		2,018	1,350	70	60	5·2
May 20		1,504	996	48	56	4·8
June 10		1,442	1,266	28	34	2·2
126 days		2,501	8,073	1,020	118	12·6

I must, however, state that the statistical returns made at various times are very discordant.

Then I find that some of the methods of calculation which I have seen employed give an imperfect idea of the mortality to persons who have not closely studied these matters.

I give an illustration :—

I take a hospital of 1,000 beds, constantly occupied during one year, into which during the year 10,000 sick are admitted, and 10,000 discharged, viz., 1,260 dead, and the rest cured. Then, if we divide the deaths in the year by the *average strength*, as is ordinarily done in determining the mortality of the whole army, it will be found that the 1,260 deaths in a year out of a mean strength of 1,000 imply that the mortality was at the rate of 126 per cent. per annum. If this method be employed, it will show the comparative sanitary condition of the sick in two or more such hospitals.

Again, as the number of deaths (1,260) took place among 10,000 cases, the mortality was at the rate of 12·6 deaths in every 100 cases.

In the case supposed, one of the imperfect methods of calculation in use, to which I have referred above, would make the cases 62,000, out of which the 1,260 deaths occurred, and the mortality of these cases would be stated at 2 per cent.

The way in which this result is obtained is sufficiently simple. 1,000 cases would remain in the hospital at the beginning of every week ; the new method counts the cases remaining every week, or fifty-two times in a year, and adds to them the cases admitted, so that, in addition to the 10,000 cases really treated, it obtains 52,000 fictitious cases, simply by counting the same man rather more than six times ; that is, by counting the patients remaining 52 times annually, and adding them to the new patients admitted.

If the number remaining at the beginning of every month were counted, 12,000 would be added to the 10,000 real cases treated.

It is evident that, by counting the cases *remaining* at the beginning of every day, or oftener, the *cases* may be multiplied to any conceivable extent.

By dividing the *weekly* deaths by the force in the Crimea, as was done in the published returns, the high mortality in the Crimea *appeared* to be exceedingly low. For people naturally took the mortality per cent. per *week* for the mortality per cent. per *annum*.

For the purposes of accurate comparison it is necessary to reduce all our facts (1.) to unity of time, (2.) to unity of strength, or numbers under observation.

I find, after consulting the best statistical authorities, that the mortality of hospitals can be compared in two ways, which mutually check and confirm each other: (1.) by dividing the deaths by the mean "strength" of the sick in hospital, and reducing the mortality to that which would obtain if the time of observation were a year. By this method, it will be seen in the Table I give in, that the mortality in the Bosphorus hospitals fell from 415 per cent. per annum in February to 235 per cent. per annum in the three weeks ending March 17, 1855, to 125, 79, 60, 56, and 34, in six successive periods of *three weeks* each.

By the second method the *deaths* are divided by the number of *cases treated*. Where the number of sick is stationary, the numbers (1.) admitted and (2.) discharged (including deaths) must be equal in a given time. The number of cases treated will be represented by the numbers either admitted or discharged, as they are equal. When the number of sick increases or decreases, the numbers admitted and discharged will differ; but the number of *cases treated* will, in all ordinary cases, be nearly represented by taking the mean of the numbers admitted and discharged. Thus 6,751 patients were *admitted* into the Bosphorus hospitals in the 126 days: February 25—June 30, 1855, and in the same period 9,392 patients were discharged. The cases treated are represented by—

$$\begin{array}{r} 6,751 \\ 9,392 \\ \hline 2) 16,143 \\ \hline 8,072 \end{array}$$

As the deaths were 1,020, the mortality on the cases treated was 12·6 per cent.

By this method, the mortality of the cases was at the rate of 31·5 in the first three weeks, and fell progressively to

$$\begin{array}{l} \text{Per cent. of cases treated} \quad - \quad \left\{ \begin{array}{l} 14\cdot4 \\ 10\cdot7 \\ 5\cdot2 \\ 4\cdot8 \\ 2\cdot2 \end{array} \right. \end{array}$$

As 2,501 were under treatment 126 days, the days of sickness were $2,501 \times 126 = 315,126$ days, which allows—

$$\frac{315,126}{8,073} = 39 \text{ days}$$

to the treatment of each case on an average.

In the first period the cases were under treatment about 49 days; in the last, 24 days.

While the mortality fell from 31·5 to 2·2, the duration of the cases fell from 49 to 24 days.

Note.—Showing the reason why the cases treated are represented by the mean of the numbers (1.) admitted and (2.) discharged in a given time.

The number of cases treated ($= C$) is the number of cases admitted and followed from their commencement to their discharge from the hospital, dead or alive.

When the hospital is (1.) opened and (2.) closed empty, the number of cases treated is the same as the number admitted.

But the hospitals of the Bosphorus contained 3,975 sick soldiers on February 25, 1855; 6,751 sick soldiers were admitted in 126 days, and on 30th June 1,334 remained under treatment.

Now some of the 3,975 cases in the hospital at first ($= F$.) had just entered; others had been one, two, three days under treatment, and others were just on the point of leaving. On an average it may be assumed that they had been treated during half the average term of treatment, and it may be assumed that 3,975 treated for a half term—as respects the mortality—may be held to represent half that number, or 1,987 cases treated for the full term. To obtain the cases treated, we therefore add 1,987 to 6,751, the new cases admitted, thus making 8,738, from which half the number of 1,334 cases remaining on June 30, or 667, must be deducted, leaving 8,071 to represent the

number of cases treated. Half the 1,334 cases remaining ($=667$) ($=\frac{1}{2}$) are deducted, because those 1,334 cases have been already counted in the *admissions* as whole cases, although they have only been half their time under treatment, and are fully represented by 667.

The equation will stand thus, putting A for new cases admitted, F for cases remaining on the first day, and L for cases remaining on the last day :

$$A + \frac{F}{2} - \frac{L}{2} = C.$$

But, by putting D for cases discharged, it may be shewn by similar reasoning that

$$D - \frac{F}{2} + \frac{L}{2} = C.$$

And, on adding these two equations together, we have—

$$A + D = 2C \therefore C = \frac{A + D}{2}$$

The cases treated are nearly represented by the mean between the new cases admitted (A.) and the cases discharged (D.) dead or alive. It is here assumed that the mortality is at the same rate in the latter half as it is in the first half of its sickness. If it be greater or less the result will be slightly affected, according as the numbers remaining at the beginning and end of the period of observation are in excess.

10,005. From your experience of the great mortality of the hospitals at Scutari, and the manner of estimating it, do you consider the weekly state of the army likely to give a correct idea of the disease and mortality ?

From the extracts given in the Appendix, which are taken from the letters of the principal medical officer to the commander of the forces, it will at once be seen, that what the commander of the forces and the war department want to know and ought to know about the health of an army in the field was not supplied them.

What they want to know is (1.) how long the army will last at the then rate of mortality.

(2.) Whether the diseases are preventible from which the mortality arises.

(3.) What proportion of the army is inefficient from sickness.

1. The mere information that "the admissions to strength have been in the ratio of 3.93 per cent." during "the present week," and "the deaths to strength 0.38 per cent." (*see Note A. annexed*), is simply misleading to the authorities, unless indeed, which is hardly likely, they are thoroughly *au fait* at statistical inquiries.

The standard of comparison all over the civilized world is the percentage of deaths per *annum*; also the per-centage of admissions into hospital in the same time.

And, without reference to the same standard, it is impossible for the most experienced man to judge.

0.52, 3.93 per cent. look nothing.

But multiply 3.9 by 52 = 2,028, in order to get the annual admissions per 1,000; and it will be found that the whole force will go twice through hospital in a year, at that rate. And multiply 14.3 (*see Note A. annexed*) by 52 = 7,436 per 1,000 per annum; and the whole force will go seven times through hospital in a year.

It is not, however, said whether this "sickness" of "14.31 per cent." is admissions, or remaining and admissions, or sick population. Probably it is the second. But is this a state of things to congratulate a commander of the forces upon, as being "pleasing" to him "to learn" ?

Multiply 0.52 by 52 in the same way, and it will be found that the mortality is 270 per 1,000 per annum. In other words, that more than one fourth of the whole population of the army will perish in a year.

2. At a time when every one in the Crimea was expecting cholera, which actually did come, and is shortly after recorded by the inspector-general himself, the commander of the forces is congratulated on the "steadily improving" state of the "health of the army."

During the 10 weeks intervening between May 5 and July 14, 1855, 96 per cent. of all the deaths from disease were of the classes usually considered mitigable and zymotic. That is to say that, granting that the four per cent. were not preventible, there might have been saved to the commander of the forces a large part of the 96 out of every hundred men he lost from disease.

Is not this important to him to know from his returns at a glance ?

3. For a commander in the field, the number of deaths among his men is, after all, not so necessary to him to know as the rate of inefficient men from sickness he has, and how far the sickness can be mitigated or prevented.

In January 1855 more than half the infantry were sick in hospital, and three fourths of all that sickness was zymotic, and so it continued from October 1854 till July 1855. Nay, even in that dreadful week which included the attack on the Redan, June 18th, 1855, even in that week nearly 65 per cent. of all the deaths in hospital were zymotic.

Of what vital importance it is to a commander and a government to know this?

Now take the unit of per 1,000 of the force per annum, and let the advantage of a comparison be shown, viz., of the mortality at different periods of our history in the Crimea.

Deaths per 1,000 per annum at different periods.			
January	{ 1855	-	1,173½
	{ 1856	-	21½
May	{ 1855	-	203
	{ 1856	-	8
Jan. 1 to May 31, 1855		-	628
Jan. 1 to May 31, 1856		-	11½
<hr/>			
Crimea, May 1856.	Line at home.	Guards at home.	
8	18·7	20·4	

Thus we were losing in the Crimea, in May 1856, less than half of what we lose in the line at home, and little more than two-fifths of what we lose in the guards at home.

It is obvious that what is wanted is for the commander of the forces in the field and the Secretary of State for War to be made instantly and continuously acquainted, (both as to an army at home and in the field,) with not only (1) the real proportion of mortality, (2) the real proportion of disease; but also (3) the *kind* of disease and mortality.

Therefore—

1. Present strength.
2. Sick in hospital at a given date.
3. Total admissions since last report.
4. Total deaths since last report.
5. Per-centage of sick to present force.
6. Per-centage of deaths to present force *per annum*.
7. Per-centage of admissions from zymotic disease to total admissions.
8. Per-centage of zymotic cases in hospital to total sick.
9. Per-centage of deaths from zymotic disease, to total deaths from disease.
10. Admissions from wounds and deaths from wounds.

At short periods, both departments should be furnished with a statement of these 10 points, so as to appreciate them at a glance.

It may easily be ascertained what the weekly states for an army in the field are now, as furnished to the commander of the forces by his principal medical officer, and what the daily states furnished by his adjutant-general.

Something of the following I have seen :—

Weekly State.

1. Strength in field as given by adjutant-general this morning.
2. Admissions.
3. Deaths.
4. Present sick.
5. Admissions to strength.
6. Deaths to strength.
7. Sick to strength.
8. Decrease of mortality this week.

But nothing as to “per annum,” or as to zymotic disease.

Now, is it surprising that the mortality of the army was high in the Crimea? Is it not a fact that the mortality of the army in peace exceeds that of men of corresponding ages in the general population? At home, the guards and infantry of the line suffer more from consumption and chest diseases than men in civil life, at the same ages, from all diseases put together.

The guards suffer twice as much from fever—more from fever in some barracks than in others, and more from epidemics in epidemic years than civil life.

There is no *à priori* reason for this. The mere statement of it would excite inquiry into its causes and remedies, if it were generally made known.

This may be summed up in a very few words with the aid of the following data supplied by Dr. Farr :—

No. 1. RATE of MORTALITY per 1000 per annum.

Effective men of the army at home.	{	Total	-	17.5	
		Guards	-	20.4	
		Line	-	18.7	
Army ages. England and Wales	{	Country population,	}	7.7	
		Whole population,		}	9.2
Army ages. Manchester, one of the unhealthiest cities	{		}		12.4
		-		-	-
		-		-	-

No. 2. RELATIVE MORTALITY of the Army at home, and of the English Male Population at corresponding Ages :—

Ages.	Deaths annually to 1,000 living.		
20—25	{	Englishmen	- 8.4
	{	English soldiers	- 17.0
25—30	{	Englishmen	- 9.2
	{	English soldiers	- 18.3
30—35	{	Englishmen	- 10.2
	{	English soldiers	- 18.4
35—40	{	Englishmen	- 11.6
	{	English soldiers	- 19.2

That is to say, that if the army were as healthy as the population from which they are drawn, they would die at one-half the rate they die at now.

The army are picked lives, and the inferior lives are thus thrown back among the mass of the population.

The health of the army is continually kept up by an influx of fresh lives, while those which have been used up in the service are also thrown back into the general population, and give a very high mortality.

The general population includes, besides those thus rejected by the army itself, (whether in recruiting or invaliding,) vagrants, paupers, intemperate persons, the dregs of the race, over whose habits we have little or no control.

The food, clothing, lodging, employment, and nearly all that concerns the sanitary state of the soldier are absolutely under our control, and may be regulated to the minutest particular.

Yet, with all this, the mortality of the army, from which the injured lives are subtracted, is double that of the whole population, to which the injured lives are added.

But, with regard to armies in the field, where half an army may melt away from zymotics alone, or be rendered inefficient just when its services are most wanted, not by wounds, but by disease, of how far more vital importance is it, then, for the authorities to be furnished with such information ?

The proportion of admissions and deaths from
Scurvy,
Cholera,
Dysentery,
Diarrhœa, and
Fevers of each class should be distinctly stated.

For an example of the importance of this, take the following, calculated from official returns for January 1855.

			Per 1,000 per annum to Strength.	
Total admissions	-	11,290	hence	4,176
„ Deaths	-	3,168		1,173.6
			Admissions.	Deaths.
Scurvy	-	542	-	31
Scorbutic dysentery	-	181	-	44
			723	75

The deaths from scorbutic disease in that month are put down at 75 ; a month, when, as is well known, two-thirds of all
3 A

the deaths and admissions in the army were due to the scorbutic type of disease, for, see the following :—

	Admissions.	Deaths.
Acute dysentery	- 865	- 210
Chronic "	- *143	- 578
Scorbutic "	- 181	- 44
Diarrhœa	- 4,191	- 1,199
Acute rheumatism	- 342	- 58
Chronic "	- 84	- 9
Frostbite	- 1,413	- 124
Scorbutus	- 542	- 31
	7,761	2,253

The larger part, if not all, of these 2,253 deaths may be ascribed to the scorbutic type of disease. For "scorbutic" read "bad food," &c., and you have the cause.

Yet this is not brought forward at all at the time, nor prominently at any subsequent time in our returns.

Again with an army in the field, to give the admissions and deaths for the field hospitals is to give no just idea of the mortality, because it is not stated how many of those admissions were sent to and died in the general hospitals at the base of operations.

In the case of the Crimea, till the spring of 1855, no account was rendered of these.

E. g. Published Return.

Crimea.

October 1, 1854—April 1, 1855.

Average strength.	Admissions.	Deaths.
28,623.	52,548.	5,359.

General Return.

Crimea and Scutari.

October 1, 1854—April 30, 1855.

Average strength.	Admissions.†	Deaths.
28,939.	56,057.	10,053.

10,006. This mortality is much higher in the early periods than it was in the later periods—higher than it is in civil hospitals, and much higher, too, than the mortality of cases treated in the homes of artisans. Will you state in what respects the sanitary conditions of the soldiers before and after March 17, 1855, differed from the sanitary conditions of patients in civil hospitals, and of the sick whom you have no doubt visited in their own humble homes?

The sanitary conditions of the hospitals of Scutari were inferior in point of crowding, ventilation, drainage, and cleanliness, up to the middle of March 1855, to any civil hospital, or to the poorest homes in the worst parts of the civil population of any large town that I have seen.

After the sanitary works undertaken at that date were executed, I know no buildings in the world which I could compare with them in these points, the original defect of construction of course excepted.

10,007. What sanitary defects did you observe in the hospitals at Scutari, in regard to over-crowding, ventilation, cleanliness, and drainage?

(1.) With regard to over-crowding both for barracks and hospitals, the regulation in our service is over-crowding. But at Scutari from the battle of Inkerman till the middle of February, even the regulation space was not adhered to. The men were laid on paillasses on the floor as close as they could lie; there were two rows of beds in the barrack hospital corridors, where two persons could hardly pass abreast between foot and foot. I have seen 72 patients for a short time in a ward calculated by the inspector-general himself to hold 30.

For full six weeks we had in the barrack hospital 2,000 patients in the space allotted by regulation for 1,220; and for six weeks more, 2,200 in the space allotted for 1,600.

The regulation space is no more than one half of the space required, if the hospital were in a good sanitary state, but, as

* The per-centage of mortality on acute and chronic dysentery was perhaps greater than ever has been known in any disease except the worst form of epidemic plague. It was no less than 78 per cent. of the cases.

† The admissions at Scutari were not given, because they were nearly all re-admissions from the Crimea.

When we see the loss *thus* given, the real extent of it strikes us. It stands thus :

	Strength.	Deaths.
Infantry	- 23,775	9,015
Cavalry	- 1,915	280
Artillery and Engineers	- 3,249	568
Undistinguishable	-	190
	28,939	10,053

Sir Alexander Tulloch gives the mortality for those 7 months, at a per-centage for the 7 months. I give it now per annum :

Strength of the army	-	28,939
Deaths in 7 months	-	10,053
Mortality per 1,000 per annum	-	600

the regulation space was actually reduced by one half, we have the following condition of matters :—

1. The space for each patient one fourth of what it ought to have been.
2. The sanitary condition of the buildings extremely defective.

Can we wonder at the high rate of mortality ?

(2.) With regard to ventilation, the hospitals were so insufficiently heated that the inspector-general was of opinion that the men would catch cold by opening the windows. Scarcely any other means of ventilation existed, or were provided. It is impossible to describe the state of the atmosphere in the barrack hospital at night. I have been well acquainted with the dwellings of the worst parts of most of the great cities in Europe, but have never been in any atmosphere which I could compare with it. I have produced statistics to the Commission, showing that the mortality on the sick population in January was at the rate of 319 per cent. per annum, the mortality in February at the rate of 415 per cent. per annum, while that on board the transports had fallen from 90 per 1,000 in January to 19 in February, showing the improved character of the cases. There is only cause for wonder that the mortality in Scutari was not more, as such an atmosphere as there prevailed was, perhaps, worse than that known to produce cholera and typhus epidemics among healthy persons.

Both ventilation and cubic space were better managed in the general than in the barrack hospital, but the other causes of disease were the same in both.

(3.) The ground about the palace hospital was very wet, from insufficient draining.

With regard to sewerage, the privies poured their poisons into the corridors and wards; the sewers being loaded with filth, untrapped, and without ventilating openings, the tubes of the privies were their only ventilators, and the sewer gases blew into the wards and corridors. A change of wind so as to blow up the open mouths of the drains, was therefore not unfrequently marked by out-breaks of fever among the patients. And the state of the privies of the barrack hospital for several months, more than an inch deep in filth, is too horrible to describe.

With regard to cleanliness, the ground about the hospitals, with the exception of the general hospital, was extremely dirty. I have counted as many as six dead dogs just under one ward window. And the barrack hospital yard, of great extent, was so uneven, muddy, and filthy, as to cause a most unwholesome atmosphere.

The drinking water was not free from organic matter; and on one occasion the dirty hospital dresses have been seen in the tank which supplied water.

A dead horse also lay for some weeks in the aqueduct.

The state of the floors was such, from want of repair, that the medical officer had to choose between leaving them dirty and washing them which produced erysipelas.

The wards washed in the morning have been seen quite wet at the evening visit.

The walls and ceilings were saturated with organic matter, and should have been lime-washed for safety at least once in three weeks, notwithstanding the inconvenience of such a proceeding for cases which could hardly be moved. The rats, vermin of all kinds, accumulations of dirt and foul air, which harboured under the wooden divans on which the men were laid, rendered the atmosphere still more dangerous to them.

There was a great absence of utensils, and tubs were used for several months in some of the wards, the effect of which on the atmosphere in which the men were need hardly be described.

The burial of the dead was conducted in such a manner, and so close to the general hospital as to affect the purity of the air.

I would refer the Commission to our statistics, which show that the mortality rose from 17.9 per cent. in December, on cases treated, to 32.1 per cent. in January, to 42.7 per cent. in February; although in February we could scarcely be said to be much over-crowded, and the character of the cases from the Crimea had improved. What else could this increase be due to but to our defective sanitary condition ?

10,008. How were the sick provided with bedsteads, bedding, ward furniture, utensils, and clothing ?

The bedsteads in the general hospital were sufficient, some of theirs having been left by the Turks.

In the barrack hospital, only a small proportion of the patients had bedsteads in the month of November. There never was a sufficiency of iron bedsteads. Boards and trestles were gradually introduced, till all the patients were raised from the ground.

We had always a sufficiency of blankets, although often covered with filth and vermin. We never had anything but paillasses, excepting for the worst cases, to whom some hair mattresses were given out. The sheets were of canvas, so coarse that the men begged to be left in their blankets. It was indeed impossible to put men in such a state of emaciation into those sheets.

Generally speaking, I have no hesitation in saying that, with the exhausted constitutions of our men, the consequences were fatal of laying them on paillasses, only separated from the floor by the wooden divans in the wards, and by mats in the corridors, which were flagged with limestone, Maltese stone, or unglazed tile. At the same time, I wish to say that none of our men ever made a complaint to me of the hardness of their beds, but the reverse; and I derive my opinion solely from a long habit of watching the sick. Never should a paillasse be seen in a military hospital again without a mattress over it. Any number of mattresses could have been had, in an Eastern capital like Constantinople, any day, where every man carries about his bed with him. These would, of course, have been cotton.

With regard to ward furniture and utensils, there was in the barrack hospital an absolute deficiency of these things. A soldier is expected by our regulations almost to furnish his own hospital, with some slight assistance from the barrack department. Now, at Scutari, we had neither barrack department nor soldier's kit, for the men had to abandon their kits, as is well known, and did not recover them till a later period. The consequence was, that when we, on two successive occasions, opened newly-repaired divisions of the barrack hospital to an influx of some hundreds of patients, there was no furniture whatever in the wards but the beds. And all utensils, whether for eating and drinking, taking medicine, cleaning, washing, or other purposes, were deficient. There were also neither chairs, tables, benches, nor any other lamp or candlestick but a bottle. In January, I mentioned this to the then Principal Medical Officer, and he answered, "I perceive you are not aware that these things are found by the barrack department." I also mentioned it in the presence of the inspector-general to the purveyor-general, and he answered, that he did not intend to supply the things, having no warrant to that effect, which was true.

I will put in a list of what was in store on January 1, 1855, in the way of ward furniture.

January 1, 1855.*

Plates (tin) - - - none	Bolsters - - - none
Candlesticks - - - none	Night caps - - - a few
Tin drinking cups - - - none	Slippers - - - none
Urinals (metal) - - - plenty	Knives and forks - - - none
Bed pans - - - some	Spoons - - - none
Close stools - - - plenty	Flannel shirts - - - none
[but frames wanted	Socks, pairs - - - none
Tin pails for tea - - - none	Drawers, pairs - - - none
[at present	Some tea pots and coffee pots.

* On this day, the number of patients who had arrived in the hospitals of the Bosphorus during the last fortnight amounted to 2,532, and were followed by 1,044 in the next six days.

With regard to clothing, a limited quantity of very good hospital dresses was in use among the patients. But many of the men came down almost without shirts, or indeed any kind of clothing, but a blanket and a pair of trowsers. From November till after the winter clothing was served out, the supply was very deficient, in hospital, either of shirts, socks, or other articles of underclothing.

10,009. The want of shirts, and indeed of almost all clothing, on the part of the men, being proved beyond the possibility of dispute by the statement of almost every official,—in General Airey's words, "the army was almost without clothes,"—What was the "enormous supply" which, as Commissioner Maxwell states, "co-existed with constant complaints of "the want of the articles in question"?

The number of shirts issued from the quartermaster-general's store at Scutari was, up to 15th February, 4,387, a number equal to the men discharged from hospital between December 5, the period when these issues commenced, and January 31, viz., 4,349.

The purveyor states that he issued from October 1 to February 15, 11,234 shirts, of which he says 2,500 were delivered to Miss Nightingale. Now, 800 only were delivered to her, the 2,500 having been made requisition for by her, but 800 only received. As usual, the amount of the requisition and not of the actual issue was debited. Another example of the fallacy of requisitions as vouchers for receipt, although there is no shadow of suspicion of dishonesty. (*See Note D. annexed.*)

The 800 appear again in Miss Nightingale's schedule ; therefore deducting from

11,234

2,500

8,734 remain.

Miss Nightingale issued from November 10, 1854, up to February 15, 1855—(*See Cumming—Maxwell Report*, p. 35.)

10,537 cotton shirts.

6,823 flannel shirts.

17,360

Of which 400 and 400 respectively were, as just stated, from purveyor's store.

Therefore, there were issued—

Shirts.

4,387 from quartermaster-general,

8,734 from purveyor,

17,360 from Miss Nightingale.

30,481

Up to December 4, it appears that the number found in patients' knapsacks was 22 ! (*See Note D. annexed.*)

Surely, in the above issues there can be found nothing extravagant or unnecessary, but, on the contrary, they must be thought absolutely indispensable, being, as they were, issued upon requisition from the medical officer ; the quartermaster-general's issues only excepted, which were made upon inspection of the men's kits.

10,010. How were the sick provided with medical comforts, diets, and extra diets ?

I do not consider the supply of these things to have been ever deficient in quantity. In quality the bread and meat were good, the eggs, fowls, and milk generally very bad ; the arrow-root and port wine sometimes bad. At the same time the cooking was what was chiefly to be complained of. The waste in the wards was enormous, because the men were really unable to eat diets so cooked.

10,011. Were the kitchens and extra-diet kitchens sufficient ?

There were no extra-diet kitchens at all till those of the female nurses were constructed, which were followed by the construction of one by the excellent staff-surgeon of one of the divisions of the barrack hospital. The general kitchens simply consisted of boilers and tin pots on Turkish braziers till M. Soyer improved them, in April 1855. Practically, although not theoretically, it was acknowledged by the medical officers, that in order to make the men eat at all, it was necessary to feed them almost exclusively on extras. It need hardly be stated that the extra diet system is cumbrous, wasteful, inefficient, expensive. (*See Note C. annexed.*)

10,012. Were any difficulties experienced in obtaining food, clothing, bedding, medical comforts, or extra diets, when procurable ?

Difficulties were experienced in obtaining some articles of extra diet, shirts, clean linen, and bedding, ward furniture and utensils, light and fuel, even when procurable in the market or actually existing in store. I could mention many such examples. After May, 1855, however, no such difficulties, or very few, occurred at Scutari ; but in that summer, in the Crimea, and even at a later period, they still existed.

10,013. What appeared to be the cause of such difficulties ?

I would mention :—

(1.) The system of requisition.

(2.) That of requiring the soldier to bring the contents of his own kit into hospital, which, in war time especially, the time when most required, must oftenest be wanting.

(3.) The fear of being called a "troublesome fellow," which, to my positive knowledge, deterred medical officers from making repeated requisitions for articles which they knew to be necessary for their men, or for repairs, because they feared that such conduct would injure their prospects.

This will be denied. But it is true for all that.

(4.) And chiefly, the total want which existed and does exist of any scheme of organization for general hospitals.

Our system has always been regimental ; and the only theory of a general hospital which exists in our service is that of an aggregate of regimental hospitals. This will not be denied, because the theory was and is still maintained by many senior medical officers.

10,014. How were they overcome, and what, in your opinion, would be the best way of preventing them in future ?

(1.) The sanitary defects were first overcome by the Sanitary Commission, which arrived only March 6, 1855.

(2.) With regard to stores, I can best answer the question by putting in an abstract of some of the principal articles supplied from private sources to the hospitals, &c., at Scutari, on requisition from medical officers, as well as to those in the Crimea, and only after ascertaining, in most instances, that the articles did not exist in the purveyor's store or were not to be issued thence.

* Shirts (flannel and cotton)	-	-	-	50,000
Pairs of socks and stockings	-	-	-	23,743
* Pairs of drawers	-	-	-	6,843
* Towels	-	-	-	5,826
* Handkerchiefs	-	-	-	10,044
* Comforters	-	-	-	9,638
Flannel	-	-	yards	1,384
Pairs of slippers	-	-	-	3,626
Knives and forks	-	-	-	856
Spoons	-	-	-	2,630
Night caps	-	-	-	4,524
* Gloves and mits	-	-	pairs	4,545
Drinking cups	-	-	-	5,477
Tin plates	-	-	-	2,086
* Basins, zinc, &c.	-	-	-	624
Dressing gowns	-	-	-	1,004
Air beds and pillows	-	-	-	232
Thread and tape	-	-	packages	74
* Lanterns, candle lamps, and lamps	-	-	-	168
Preserved meats	-	-	cases	253
Meat biscuit	-	-	barrels	2
Isinglass and gelatine	-	-	lbs.	148½
India rubber sheeting	-	-	pieces, 325 yds.	26
Camp kitchens, cooking stoves and canteens	-	-	-	55
Boilers and stewpans	-	-	-	68
Tables and forms,			Brooms and scrubbers,	
Baths,			Bedpans,	
Soap,			* Tin pails,	
Games,			* Combs, scissors, &c. &c.	

were supplied with and without requisition.*

The issues of clothing were principally made before the issues of warm clothing took place in the Crimea; and even when these latter issues were being made, a letter dated January 27, 1855, was addressed by the Director General to the Deputy Secretary-at-War, recommending a clothing store to be formed at Scutari, for men discharged from hospital, which had, however, been done December 5, 1854.

It is but fair to add, for those who do not know the regulations of the service, that the articles marked with an asterisk form no part of hospital furnishing according to the regulations, and that, therefore, the fault was not in those who did not provide them. For the purveyor purveys according to his "warrants," but the soldier wants according to his circumstances. The absurdity lies in attempting to provide for war, an abnormal state of society, by normal rules, non-expansive.

(3.) With regard to system, I do not consider that the difficulties were ever overcome at all; all that was done was done by a violent expenditure, and the relaxation of all rule.

No deficiency existed in the purveyor's stores after May 1855 at Scutari; although I cannot say the same for some of the general hospitals of the Crimea. But this arose not so much from the non-existence as from the non-supply of the stores.

A far more serious question, however, than the want of stores which, with the Anglo-Saxon race, will always be supplied, in such cases, by private interposition, is, the non-organization of a system of general hospital government. For the clash of departments which now constitutes that system cannot be called a hospital government at all. It is a division with grounded arms. 1. The general officer commanding; 2, the quartermaster-general; 3, the adjutant-general; 4, the engineer's department; 5, the paymaster; 6, the commissariat; 7, the contractor; 8, the purveyor; 9, the medical department: these nine departments all step in and appeal to one another to do what each can to make a general hospital march upon regimental contrivances.

10,015. Will you state your opinion as to the best manner of organizing a general hospital, so as to make such hospital thoroughly efficient?

I will reply to this question under the three following heads. In general terms, the organization needed is,

- (1.) One for sanitary purposes.
- (2.) One for government.
- (3.) One for supply.

(1.) The first is really the most important question. The sick might have been loaded with medical comforts, attended by the first medical men of the age; under such sanitary conditions as existed at Scutari, they had not a chance. And yet it does not appear that any adequate means had been applied for remedying the defects, after Dr. Burrell's unfortunate retirement from the service. Nay, what is more, at the time most easy, rather the only time to prevent these evils, viz. in October 1854, the hospitals in the East were reported

* A manufacture of stump pillows, bed-sore pillows—to the number of many thousands,—of arm-slings, and such like surgical needle-work, was always being carried on by the nurses. But as this is properly women's work, and it is hoped will always in future be done by them in military, and especially in war hospitals, no further mention of it is here made.

"satisfactory." This shows the low standard of excellence with which our medical officers were then satisfied; afterwards it was too late. The evils were remedied when the mischief was done. How much easier it would have been to prevent them!

I may quote, in corroboration of this statement, one made by the principal medical officer of the army in the East himself, in the published despatches.

"Dr. Hall to Lord Raglan, March 2, 1855.

"* * * *. Out of 442 patients treated in the general hospital at Balaclava, between February 18-24, only three casualties have occurred, which I think may fairly be termed a low rate of mortality, considering the class of patients that are generally sent in there for treatment, men brought down from camp, and found too ill to embark when they arrive at Balaclava."

The above mortality is 12 per month, or 27 per 1,000 per month. If these men had been sent to Scutari in February, there would have died not 12 but 189. The deaths to cases treated at Scutari in February being 427 per 1,000, instead of 27 per 1,000, and from February 25 to March 17, 315 per 1,000.

And, according to Dr. Hall's statement, these cases treated at Balaclava were kept there, because they were in a worse state than those sent down to Scutari.

The distinction between personal and public hygiene must not be overlooked. It is acknowledged in civil life. The officer of health of towns, who was first proposed by Mr. Martin, does not do the work of the physician or surgeon; and, on the other hand, you do not send for your physician or surgeon to drain your street. Had an officer of health been attached to the quartermaster-general's department at the base of operations, who would have put to rights those buildings before we occupied them, how much life would have been spared! This officer should have full powers, through the quartermaster-general's department, to see 1, to the draining of sites; 2, to the sewerage; 3, to the cleansing of outskirts; 4, to the ventilation; 5, to the water supply; 6, to the lime-washing and cleanliness of the buildings; 7, to the allotment of cubic space; 8, to the sanitary conduct of burials.

There is quite enough for one man to do here. There is no more need for this administration of the hygiene of buildings to clash with that of the personal hygiene of the patients, which must be left to the medical officers, than in precisely the analogous case of civil life, where no man ever thinks of confounding the two.

Before and after the works executed by the sanitary commissioners, begun in March 1855, the hospitals at Scutari bore a similar sanitary difference to that which the gaols of the last century, which were pest houses, did to Colonel Jebb's prisons of 1857, the most healthy buildings in existence.

The rate of mortality in the hospitals was higher in February than in January, although the mortality on board the sick transports had fallen off from 90 per 1,000 in January to 19 in February, proving that the sanitary condition of the hospitals was deteriorating (although the number of sick had diminished), while the sanitary state of the transports and the condition of the sick was improving. The mortality, even to March 17, continued higher in these hospitals than it had been during the average of the four months, October 1854, November, December, and January 1855. The sanitary works were then begun, and, after their completion, the mortality fell to less than one-sixth of what it was when the barrack and general hospitals were first occupied together in October 1854, and to one-nineteenth of what it was in February 1855. What other inference can be drawn from such statistics and conditions but this, that, had nothing been done, before four months were out, or as soon as the hot weather set in to give fresh strength to the seeds of epidemic disease buried among us, the hospital population of the Bosphorus would have been swept from the face of the earth, and there would have been no one left in those lazar-houses to tell the tale? Civil life is full of similar lessons.

I am bound to say, that the military hospitals I have seen in England, Portsmouth, Chatham, Brompton, are almost as much in want of certain sanitary works as Scutari.

2. Government.

(2.) One executive responsible head, it seems to me, is what is wanted in a general hospital, call him governor, commandant, or what you will; and let it be his sole command. Let him be military, medical, or civilian officer, as the possession of administrative talents point out a man for the work.

The departments should not be many :—

1. A governor, solely responsible for everything but medical treatment.
2. A Principal Medical Officer and his staff, relieved of all administrative duties, and strictly professional.
3. A steward, who should fulfil the duties of purveyor, commissary, and barrackmaster, and supply everything, subject to the governor.
4. A treasurer, who should be banker and paymaster.
5. A superintendent of hospital attendants, who should undertake the direction of the cooking, washing, care of hospital furniture and government of orderlies.

All these officers to be appointed at home by the War Department. According to this plan, the governor would cumulate the functions of quartermaster-general and adjutant-general, and therefore the sanitary officer mentioned before would be attached to him instead of to the quartermaster-general. The governor would be solely responsible for carrying out the works advised, and for engaging the labour requisite to do so.

(3.) Supply.

With regard to the mode of supply, let the steward furnish the hospital according to a fixed scale, previously agreed upon. The mode of supply by requisitions is faulty both ways, both in pretending to supply that which is not in store, and in not supplying that which is. For the requisition remains, although the supply has never been given. And the supply is often not given, although it is in store.

With regard to food, let the steward make contracts, subject to the governor's approval, and with power to buy in the market at the contractor's expense, if the contractor fails.

A scheme of diets should be constructed, according to the most approved authorities, in order to save the cumbrous machinery of extra diet rolls.

Equivalents might be laid down, so as to afford the necessary choice, depending on the nature of the climate, the season of the year, the state of the market, the productions of the country, &c.

10,016. To what extent and in what manner could female nursing be rendered available in general hospitals attached to an army in the field or at home ?

Female nursing might be introduced in general hospitals both at home and in the field, if only women of the efficiency, responsibility, and character of head nurses in civil hospitals be appointed. Say one to every 25 bad cases; the orderlies doing the duty of assistant-nurses in civil hospitals under the head female nurse.

But she must be in charge of all that pertains to the bed-side of the patient, of his cleanliness, that of his bed and utensils, of the administration of medicine, of food, of the minor dressings not performed by the surgeon, in short, of all that concerns the personal obedience of the patient to the orders of the surgeon. She must accompany the surgeon on his visits, and receive his orders. She must also report any disobedience of the orderlies, as far as regards the patient's personal treatment.

There need be no clashing with the ward-master or hospital serjeant. On the contrary, it would be the duty of these to enforce the nurse's authority. They will have enough to do besides with returns and accounts, and with enforcing discipline as to hours, meals, clothing, &c. among the orderlies out of ward.

The female nurses should be of course under a female head, whose duties must be carefully arranged so as to be in accordance with the code of hospital regulations.

10,017. Are you of opinion that female nursing could be employed advantageously in regimental hospitals ?

I am not.

10,018. What was the method in use at Scutari, when you went there, for receiving and admitting sick and registering their admissions and diseases, and how were the results, deaths, and burials recorded ?

Up to the middle of February 1855, the method said to exist was the following :—The adjutant or his serjeant stood at the landing-place or hospital gate and took the names of those who were able to speak, receiving a verbal report from the officer in charge of the number who had died during the voyage. At first, there was no arrangement for registering the sick when they were received into hospital. And the erasure of the man's name from the diet roll was at one time the only record of his death, excepting the adjutant's head roll of burials.

I believe that the medical officer in charge always endeavoured to make a nominal roll on the voyage from Balaklava to Scutari; more than one has stated that it took him half a day from his professional duties about the sick to do so. But, whatever this nominal roll was, it went to the principal medical officer's office, and not into the wards; one copy was given, I have been told, to the deputy assistant quartermaster-general on landing.

But at what period this was first done I am not aware. It has been stated to me by several medical officers that, even as late as March 1855, the inspecting medical officer of transports, upon going on board, frequently found this list imperfect, owing to the illness of the medical officer in charge, or other unavoidable cause, and had to complete it then and there.

Till the middle of February, or later, we had no bed-tickets, and no regular death returns. It is well known that the sick were put on board at Balaklava without nominal or numerical lists up to February 1855. Upon their admission at Scutari, an assistant-surgeon has been charged late in the evening to take the names, regiment, regimental number, &c., and to make the diagnosis of above 100 patients before nine the next morning. One twentieth have been known to die before they could give their names.

After the end of March all this confusion ceased. But it was not till the end of April that a census of the hospitals was taken, and returns "squared" with the adjutant-general in the Crimea.

Returns probably existed of which I knew nothing. I am speaking only, first, of what I saw; second, of what I was informed by witnesses on the spot and at the time.

The conclusion I draw from all this is, not that any one was in fault, for all were burdened with work beyond their strength, but that there was at first no system of registration for general hospitals, and that a registrar is an essentially necessary officer for such an institution.

In consequence of the great confusion of the hospitals from the battle of the Alma till a late period of the winter of 1854-55, a number of men were buried from the hospitals, exceeding in six months the deaths reported in the orderly room by 530. But the deaths reported in the orderly room exceed those reported in the hospital books,

In November by	-	-	12
„ December „	-	-	143
„ January „	-	-	125
			<hr/>
			280

while, as if to make up the lost ground, the medical returns, which had exceeded the orderly room returns

by 12 deaths in October, exceed again
by 253 „ February,
<hr/>
265

bringing the sum of deaths very nearly equal. The adjutant having buried 280 men more than the total number reported by the inspector-general as dead, the account had to be balanced at a subsequent period.

By the census taken of the hospitals, April 30, 1855, it appeared that 517 non-commissioned officers and soldiers had been buried whose deaths were unrecorded. An official report was then sent up to the adjutant-general in the Crimea, and they were struck off the strength of the army. The names and regiments of 28 others remained unknown.

I have carefully compared the statistics from six different official sources, and none of them agree.

It is possible that, in some of these cases, the numbers of deaths may be the numbers occurring in the several months, in other cases the numbers recorded in those months. At the same time, the great discrepancies in the several numbers shake confidence in their accuracy, and render it difficult to make any use of them for statistical purposes.

From details given in Note B. annexed, it will be seen (1.) that there are three different returns of the deaths on board the transports from Balaklava to Scutari, and that the number reported is different in each separate return. Nay, there is scarcely a single ship for which the returns agree.

2. The adjutant's head-roll of burials, the most trustworthy record of deaths, exceeded in six months by upwards of 500 the number reported as having died in the hospitals. And the adjutant states that this list of burials does not include civilians.

3. The director-general himself represents the very numbers in the "return of total sick *treated in Lord Raglan's army*"* as having been *treated at Scutari* alone in November, December 1854, and January 1855.

* Appendix, Third Report, Committee before Sebastopol, p. 470; Second Report, p. 705.

4. The returns of dead at Scutari from October 1 to December 31, 1854, vary as follows :—

Adjutant's return of burials.	Reported deaths.	Principal Medical Officer's return.	Crimean return (infantry alone).
1,301	1,046	910	795*

Smyrna hospital did not then exist. And Koulali did not exist till December, and contained then, as a maximum, but 240 patients.

These sources of discrepancy are therefore eliminated.

The result of my examination of these statistics is simply this, that however satisfactory they may be to the departments who have put them forth, and whichever of them may be correct, exhibiting as they do such palpable diversity, still, to any one not in the secret as to how things which apparently differ so widely are nevertheless identically the same, they convey no trustworthy idea as to the sickness and mortality of the army in the East, and that, for any practical purpose, they are as put forth to the public who are most interested in the matter not absolute truths, but only approximations.

The calculations which I give, I believe, understate the mortality actually experienced.

10,019. How were discipline and obedience to medical and hospital orders enforced among the patients and orderlies of the hospitals in the East?

In the sense in which discipline is understood in the army, *i.e.* of teaching or learning how intelligently to obey orders (which we saw carried to the highest perfection in the Crimea), there was little or none in the hospitals.

It is not meant by this that the men made a "shindy" whenever they were left alone, or that they did not stand at attention when the medical officers went into the ward. There was, in fact, a little too much of this. It is meant that hospital discipline consists in enforcing hospital treatment, and hospital treatment consists in the administration of medicine, of diet, the application of the minor dressings, the cleanliness of the ward, that of the patient, his bedding, and his utensils, his personal obedience to the surgeon's orders as to keeping his ward, his bed, or his position, &c., &c. To enforce in all these matters obedience to the surgeon's orders is to enforce hospital discipline.

Another branch of discipline consists, no doubt, in the man's respectful demeanour to his officers, in the accuracy of diet rolls, returns, accounts, &c., &c. This is not here spoken of, because it is not strictly hospital work. In hospital work, the meaning of the words to be "in charge" is, we presume, to receive the medical officer's orders, to see them obeyed, and to take measures so that they cannot be disobeyed without its being known and remedied.

Now, in military hospitals, there is no one *thus* "in charge."

The ward-master or hospital-serjeant has duties so multifarious that three men could not perform them all with any satisfaction, and the nursing work is generally sacrificed to the writing work, unless the ward-master be, as sometimes, but rarely, happens, a very good nurse.

The orderlies do not bring "skilled labour" to the work, and the medical staff corps far less. There is little or no training; it is a truism that less work is done less well in the same time by unskilled than by skilled labour.

The cleaning and airing of the wards in the morning would make a housemaid laugh; at Scutari each orderly worked at it in his own way, and then the patients undid it all, and it had all to be done over again.

Except when the medicines were given by the medical officers themselves or by the women, they were taken by the patient or not, at his own discretion.

The meals were at first irregular, and throughout the patients scrambled for them. It occurred frequently that the bad cases, when unable to feed themselves, were not fed at all, except by the women; that a great mess of cold arrowroot and wine stood by the bedside the whole day, till it was thrown away; that the poultices were put on cold, or left on till they were hard, and then not washed off; that the bed-sores were unattended to till they had become so bad that the medical officers' attention was called to them; that the patients were left dirty unless they asked to be washed; that the utensils were never emptied more than once a day; that the keeping certain very bad cases constantly dry and clean was almost wholly

* The deaths of the cavalry, artillery, and engineers, averaged together about one-ninth of those of the infantry at Scutari, according to the Adjutant-General's return for seven months, viz., October 1, 1854 to April 30, 1855. This would not have equalized the numbers for 9)795(88, 795 + 88 = 883.

unattended to ; that the patients ordered to remain in bed were as often out of bed, or even out of the ward, or smoking in the privies when these were cleansed and ventilated. The position of surgical cases in bed was generally not attended to.

Many orderly medical officers were so zealous in their duties that they would drudge through all these details, and see them carried out themselves ; but this is not discipline, nor can it be, unless the medical officer were in his ward through the whole 24 hours.

If these things are denied, I say I speak from personal experience, and, with regard also to the military hospitals at home, I have seen and heard of the same things there.

It would be easy for me, in all these assertions, to cite the particular instances, but I am not disposed to bring upon individuals censure for defects which I believe to be inherent in the system.

The medical staff corps are, for the most part, nothing but sweeps and ration-carriers. There are some first-rate subjects among them, but the endowments of most of them were first-rate ignorance of the details of nursing.

If all the nurses were turned out of civil hospitals and men engaged promiscuously, without character, to do their work, we should see the same results.

10,020. How were the inspections conducted, as far as they concerned hospital order ?

The medical inspections, as far as I saw them, with some very brilliant exceptions, regarded only hospital order, and were conducted with little reference to the state of the patients.

I will describe the state of the general hospital at Balaklava when I came into it, April 11, 1856, a time when there was by no means any pressure.

The first night I found from 10 to 20 of an Irish regiment talking and drinking in the extra diet kitchen.

A quantity of extra bedding and clothes were cumbering the wards, instead of being in store.

Under the beds and under the mattresses were the patients' private clothes, large boxes, carpenters' tools, wood, coals, dusters, brooms, stones used in cleaning the wards, boots, shoes, and slippers. These things were concealed by the bedclothes.

One patient, suffering from frost-bite, who subsequently died, had not been moved for a week. Being unable to leave his bed, and having been neglected, he was found in a state indescribably horrible.

The excellent second-class staff surgeon who came on duty the same day I did, immediately set to work to introduce real order and cleanliness. On April 14 the principal medical officer of the army visited the hospital without requiring this staff surgeon, who was in charge, to accompany him ; and, on the subsequent day the principal medical officer censured this officer for "the state of dirt and disorder," which was the removal of "dirt and disorder," in which he had "found the whole establishment."

In that hospital, when going over at night the whole of the wards, of which seven were in the building, and fourteen were huts, I have not found a single orderly perfectly sober who was sitting up in the huts, and one or two in the building not sober either. This was the medical staff corps.

10,021. Can you state why the homes of the poor in the country are kept comparatively clean and healthy, on very moderate means ?

I think that the woman is superior in skill to the man in all points of sanitary domestic economy, and more particularly in cleanliness and tidiness. I think great sanitary civil reformers will always tell us that they look to the woman to carry out practically their sanitary reforms. She has a superior aptitude in *nursing* the well quite as much as in nursing the sick. At the same time, I am bound to say that nothing can be more perfect, at least to outward appearance, than the cleanliness of a ship. But the sailor is a race *à part*.

10,022. Is it the peculiar skill and industry of the English labourer's wife to which this is referable in the one case, and to the incompetency of men on the other to conduct the domestic economy of a home or an hospital ?

I think so. I think the Anglo-Saxon would be very sorry to turn women out of his own house, or out of civil hospitals, hotels, institutions of all kinds, and substitute men-house-keepers and men-matrons. The contrast between even naval hospitals, where there are female nurses, and military hospitals, where there are none, is most striking in point of order and cleanliness.*

10,023. Are there not matrons in all the best civil hospitals ?

In all that I am acquainted with.

* I should perhaps state that there is a great difference, generally speaking, among the women of Great Britain and Ireland in this respect.

I would put the Anglo-Saxon race in the southern and north-western counties first in point of domestic management ; far below these come the Danish race in the eastern counties and the mixed race in the manufacturing counties, and last, the Irish and Highland Celt.

10,024. Will you state to the Commission what you consider to be the best plan of hospital construction, for fulfilling the requisites of good sanitary condition and facility of administration, with your reasons for preferring any plan or plans to others?

Hospital Construction.

The best principle of hospital construction is that of separate pavilions, placed side by side, or in line. The former is preferable. It diminishes the distance to traverse from block to block.

The distance between the blocks should be not less than double the height.

There should not be more than two flats to the block, nor more than one ward to each flat.

There is, however, no objection to having 70 to 80 sick under one roof, if, for the sake of economy, it be necessary to build each pavilion with three flats instead of two, although two flats are more convenient for administration.

For the purposes of administration, the building ought to be in a square; the basement story connected all round by an arched corridor, with an open terrace above.

The whole hospital should be erected upon an arched basement.

A hospital formed of separate pavilions could be built in line, provided large, roomy, well-ventilated, and well-lighted staircases intervened between each two pavilions.

This is the plan of the new military hospital at Vincennes, which, however, forms three sides of a square.

This principle would have been illustrated in Netley, had it been made so thin as only to have admitted two rows of beds between the windows, in the breadth of the ward, had there been no corridors, and had the pavilions been separated by staircases. It would then have been perfectly healthy; but administration would have been very difficult in so long a line.

As it is, there are to be two complete and different administrations, with two kitchens, two sets of offices complete; it is the most expensive and least *administrable* form.

There is only one kitchen to Vincennes.

That not more than 100 patients can with safety and facility of administration be massed under one roof, has come to be an acknowledged principle of hospital construction.

Buildings of two flats are most compatible with perfect sanitary conditions and facility of administration. Even in emigrant ships the occupation is limited now to one deck.

10,025. Will you state what you consider the number of sick which a ward should contain, for health, discipline, and administration, with your reasons for preferring one number to another?

The best size of wards for ensuring the two conditions of health and facility of discipline, is from 20 to 25 sick.

Wards smaller than these are more difficult to ventilate by natural means alone. A certain amount of space is requisite for diffusion, in order to secure perfect natural ventilation.

The mode of construction in hospitals is, it is presumed, to be determined by that which is best for the recovery of the sick. If any other consideration is taken, such or such a percentage of mortality is to be sacrificed to that other consideration.

But it so happens that the safest for the sick is the most economical mode of construction.

Take the example of Portsmouth hospital, or Netley, where the windows are at each end of the ward. There should not properly be more than four beds in each of those wards. For it is undesirable ever to allow more than two beds between each two windows; otherwise, when the windows are opened, the effluvia blow over all the intervening row of beds before escaping.

Wards of a smaller size than those indicated above, viz., of 20—25, are decidedly objectionable, because unfavourable to discipline, inasmuch as a small number of men, when placed together in the same ward, more readily associate together for any breach of discipline than a larger number.

It has been proved by experience that the presence of female nurses in large wards renders discipline extremely easy, and that a sufficient number of female nurses cannot be allotted in smaller wards.

In the event of a death taking place in the ward, the survivors, when they are few in number, are far more likely to be affected by it than a larger number.

It is very desirable, for the purposes of discipline, that men of the same regiment should not be placed together in the same small wards of general hospitals.

Discipline.—There needs only a comparison between the discipline of civil and military hospitals to substantiate the above assertions. If discipline mean the enforcing obedience to orders by teaching how they are to be obeyed, there is little or none in a military hospital.

In the administration of food, of medicine, in the cleanliness of the patient's person, bedding, and utensils, in the patient's personal obedience to medical orders, as to rising or

remaining in bed—all of these being matters about which there is no question or demur in a civil hospital, the discipline in a military hospital is far inferior.

How can it be otherwise? Unless the medical officer is converted into nurse, cook, and house-maid, he cannot see to all these things. The ward-master or hospital-serjeant is necessarily absent from his ward a great deal, on account of returns and accounts. The orderly cannot enforce obedience. There is no one *in charge* to enforce the medical orders, *i.e.*, without whose knowledge no disobedience can take place, as there is in a civil hospital, where one “ward sister” is daily seen in absolute control of 30–40 men, as far as obtaining absolute obedience to medical orders goes; there is no rebellion, tacit or open. This is the answer if it be asked how then was there not discipline in wards of 20–40 patients during the war.

Two other considerations are involved in that of the size of wards, economy and clinical instruction.

It may be asked, why should not all the sick be placed in one ward, provided there be cubic space enough? The answer is, with from 20–25 sick a height of 15–16 feet is enough, but it would not be enough for more, and height always involves expense.

The greatest economy and the greatest safety to patients is in the above number.

Also, without the most perfect ventilation, there is always more danger of effluvia being driven by a draught till it accumulates in one part of a very large ward, as was the case in the long corridors of Scutari.

Wards of a moderate size, like those indicated, are better for the purposes of ventilation than wards half the size; and are less subject to a hospital atmosphere than wards of double the size. But a ward of this latter size may be rendered perfectly healthy by having a height in proportion to its width.

Where clinical instruction is intended, to admit even a class of six students into a ward of 12 sick, is increasing the population in the cubic space by one half. There is more than twice the room proportionally for students, in a ward of double the size. On the other hand, if the number of students be very large, a ward of from 20 to 25 patients, it must be at once admitted, is too small. The ward must be increased, and with it its height and its cubic space; for, be it remembered, the whole of the proportions of the ward, not only its length, must increase with its number of beds; for, if the ward be very long, in proportion to its height and breadth, it becomes not a ward but a corridor, and all corridors are objectionable for sick, because it is impossible to ventilate them safely; because, in admitting air, the effluvia may be driven from one end and be accumulated at the opposite end faster than it can be taken out. The right proportion is a fixed one. But in a ward for 40 patients, 20 bad cases will be disturbed while 20 slight cases are being examined. If 20 sick only be put in each ward, the slight cases may be put together.

10,026. What amount of cubic space should be allotted for each bed?

The cubic space for each patient has been fixed by European sanitary science at not less than 1,500 feet.

A good proportion for a ward of 20 patients would be 80 feet long, 25 feet wide, and 16 feet high. This would give 1,600 cubic feet to each bed. It would give 13 feet between foot and foot, which is not too much where there is a clinical school. It would give an average of 16 feet to each 2 beds in width.

Half the sick are supposed to be on each side the ward.

10,027. What is the best proportion of windows to beds, and what ought to be the relative position of windows and beds, with your reasons for preferring one arrangement to another?

One window should be allotted for every two beds; the window to be not less than 4 feet 8 inches wide, within 2 or 3 feet of the floor, so that the patient can see out, and up to the ceiling.

The pair of beds between the windows to be not less than 3 feet apart. With a very bad fever case, I would leave the other bed empty, for the sake of isolating the patient. Miasma may be said, roughly speaking, to diminish as the square of the distance. With good ventilation, it is not found to extend much beyond 3 feet from the patient; although miasma from the excretions may extend a considerably greater distance.

Windows are to be placed opposite each other, and to be either double or filled with plate glass; the former is preferable, as it affords the opportunity of indirect ventilation in all weather. Wire-gauze across the open part of the window would afford an extent of surface for ventilation not otherwise to be obtained, and preclude all possibility of draught upon the patient.

Windows opening as at Middlesex and Guy's Hospital, in three or more parts, with an iron casting outside, to prevent a delirious patient from throwing himself out, are the best form of plate-glass window.

No part of the ward ought to be dark. This is of the utmost importance, in many cases. The light can always be modified for individual patients. But even for such patients to have light in the ward is not the less important.

There are three reasons for this multiplicity of windows:—

1. Light.
2. Ventilation.
3. To enable patients to read in bed.

The necessity of light is established by all scientific inquiry and experience. The proportion of windows to cubic space is of the first importance to health. It has been lost sight of in English architecture, owing to the unfortunate window-tax, which has left its legacy in giving us a far smaller proportion of light than in French houses. In huts, the proportion of window space to cubic space is far greater than in buildings. One main cause of the unhealthiness of large numbers of men congregated in one large building, even with sufficient cubic space, is the disproportionately small window space. In the huts in the Crimea, during the last 22 weeks of our occupation, the mortality of the whole army was only two-thirds of what it is in England.

For the same purpose of ensuring a sufficiency of light, the walls should always be white, excepting perhaps for ophthalmic wards.

10,028. What is the best material for the internal walls and ceilings of wards?

Impervious walls are of the first importance for hospitals. These walls should be of Parian or other similar cement, or glazed tiles. Brick, used at Portsmouth hospital, is highly objectionable from its porous character. Plaster is objectionable from the same circumstance, it absorbs organic matter. Both require very frequent lime-washing to keep them healthy.

10,029. What is the best material for the flooring of wards, and your reasons for preferring one material to another?

The materials used for floors may be oak wood, pine wood, composition, and tiles.

Oak wood, well seasoned, is the best. No sawdust or other organic matter capable of rotting should be placed underneath the floor. Concrete, or some similar indestructible substance, would be the best for the purpose.

The reason for using oak wood is, that it is capable of absorbing but a very small quantity of water. And it is very desirable to diminish even that capability, by saturating it with beeswax and turpentine. Beeswax is an inalterable substance. It is also desirable to avoid the necessity of washing the floor as much as possible.

The joints of the flooring must be fitted well together, and cemented with marine glue, or any other impervious substance. The object is, of course, to prevent any water from entering the floor.

Impervious, non-absorbent cement or composition would make a capital floor, used as it is in Italian houses. But, on account of its great conducting power, it would be necessary to furnish each patient with a pair of list shoes, and a small bedside carpet. The stairs and landings should be of stone. The corridors should be floored with diamond-shaped flags or tiles, which stand better than those laid in the usual manner. The terrace might be either covered with asphalte or glazed tile.

10,030. What accommodation for nurses, extra diets, clothing, and clean linen should be attached to the wards?

There should be a nurses' room, clothes room, a small diet kitchen, and also a store closet attached to each ward.

It is perhaps hardly necessary to add that there should be a few small wards for operation cases, and for noisy fever cases.

10,031. What kind of baths should be attached to the hospital?

The baths should be separated from the pavilions, but connected by the corridor.

The walls and ceilings should be of Parian cement, or some similar material, the floors of tile. They should be suitably ventilated and warmed. They should contain hot and cold water baths, sulphureous water, hot air, medicated and vapour baths, shower baths, and douche. There should be a portable bath to each ward.

10,032. What is the best form of hospital kitchen?

The kitchen should be placed away from the wards. Its walls and ceiling should be of Parian cement, for plaster has a tendency to fall off, from the vapour and effluvia of the kitchen.

The cooking apparatus, boilers, &c., if placed in the centre of the kitchen, instead of against the walls, will afford twice the amount of fire space.

In the Paris kitchens there is a brick erection in the middle of the floor, with iron doors and brass mountings, coppers with covers, places for baking and for roasting, &c.

The dressers are against the walls.

The floors are flagged with square flags.

This appears to be the most convenient mode of erection.

- 10,033. What is the best form of laundry for a hospital? The excellent new washing, drying, and wringing machines lately invented are so numerous that it would take too long to enumerate them. On the whole the laundry at the Wellington Barracks, which also washes for all the Guards' hospitals and barracks, and the new laundry at Haslar naval hospital, are the best I have seen. But every day brings in fresh inventions, and a reformer is always adopting the good ones.
- It is a further question in army matters, whether you should train a body of men to do as much as possible by hand, so as to be serviceable in the field, where machines cannot be had, or whether you should make use of all the inventions for saving labour which are now so good, and daily improving. Probably both must be done.
- 10,034. How should nurses and orderlies be accommodated? If orderlies are to sleep among their patients, the percentage of mortality will be of course raised among them. This was the case at Scutari, where it was very high, though it will never be known how high. Statistics are, however, not necessary to establish such an obvious fact. The orderlies should sleep at a distance from the wards, and not take their meals in them.
- With regard to the female nurses, there is the further question as to what class of nurses should be employed in military hospitals. My own opinion is humbly but entirely against employing any but women of the efficiency, responsibility, and character of head nurses in civil hospitals. For such a nurse a small airy room off her ward, but so that she can always have it under command, is the best for her efficiency, and need not be injurious to her health.
- Unless, however, there are facile means of access to another nurse's room, in case of illness, there must be only a day room for each head nurse adjacent to her ward. She must sleep at a distance from her ward, but contiguous to the other nurses. If assistant female nurses are employed, it must be considered that association in large dormitories tends to corrupt the good and make the bad worse. And separate accommodation, or accommodation for two or three together, should be provided contiguous to the ward, if possible—if not, to one another.
- 10,035. What kind of bedstead and bedding is the best? No bedding but the hair mattress has yet been discovered that is fit for hospitals. Hair is indestructible. It does not readily retain miasma. And, if it does, heat easily disinfects it. It may be washed. It is not hard to the patient. It saves the objectionable use of a blanket UNDER the patient.
- Straw paillasses are absolutely objectionable. They are cold; and, in some cases, the abstraction of heat from the spine lowers the patient's vital energy to a degree which does not leave him a chance. I am of opinion that the loss of life must have been great during the war from laying our patients on paillasses, which were either placed on wooden divans, or on the flagged corridors, with only a mat between.
- The bedstead should be iron; and there are great differences in the way the sacking is put in. There should always be a shelf at the head. The French have one at the feet too.
- The naval and civil hospitals have all kinds of dropsy and surgical bedsteads for raising a patient when he cannot be moved, for inclining him at a certain angle, &c., also water and air beds. There is no reason but a general objection to comfort to prevent us using these bedsteads in military hospitals.
- 10,036. What ward furniture should you recommend? Oak furniture decidedly. White window curtains are used in some French hospitals, not to exclude the light, but to look cheerful. They are desirable, but not necessary.
- The less ward furniture, speaking generally, there is the better. But if it be desired by the Commission, I will put it in a list of what is absolutely necessary. Hitherto, as is well known, a military patient has been expected almost to furnish his own ward.
- 10,037. Do you wish to say anything about water supply or drainage? The water must either be drawn from a tank at a distance from the hospital, or from a main under pressure; but never from a cistern within the hospital.
- The fault of the water supply in Parisian hospitals is, that the water is either carried up by "porteurs d'eau," or pumped up and remains standing.
- There is no question that this is wrong.
- There should be convenient means in or close to the wards for obtaining pure drinking water for the sick.
- No drain should ever pass under a hospital; all sinks, water-closets, lavatories, and baths, should be so placed that the drainage should be conveyed directly away, without passing under any part of the hospital.

- All drains or pipes for the purpose of conveying away water from any part of the hospital should be carefully trapped between the outer wall of the building and the sewer ; and all drains should be ventilated.
- 10,038. What is the best position for the water-closets and lavatories, with regard to the wards?
- The water-closets should be placed at the end of the ward, opposite the entrance, and separated by a lighted and ventilated lobby. There should be a small bath room for bed-ridden patients, and lavatory adjoining, but, of course, separate. The water-closets should be of the best construction, self-acting.
- 10,039. What do you consider the best system of ventilation for a hospital, and why?
- The doors, windows, and fire-places should be the means of ventilation for such wards as these ; nothing else is wanted. If a hospital must be ventilated artificially it betrays a defect of original construction which no artificial ventilation can compensate ; it is an expensive and inefficient means of doing that which can be done cheaply and efficiently by constructing your building so as to admit the open air around.
- But there are buildings of original defective construction which it is undoubtedly necessary to ventilate artificially. And in countries where fuel is dear and cold severe, the problem complicates itself, because it is a less consumption of fuel to warm the fresh air as you admit it.
- In the case supposed, warming is a necessary part of ventilation, and heating the air required heats the wards, without extra cost of fire-places, which always burn many times the quantity of fuel expended for warming.
- In England, where fuel is cheap, there can be no such excuse. If attendants cannot be trained to keep the rooms ventilated without draughts, there is a defect of intelligence, and attendance on the sick is not their calling.
- Occasionally, ventilating shafts carried up from the ceiling of the ward to the roof will be found an advantageous means of renewing the air.
- There should be one or more open fire-places in the ward, but lofty, so that the throat of the chimney shall be above the patient's head and bed.
- We look upon the chimney as the best ventilating shaft ; and one disadvantage of artificial ventilation is, that you must then supply the fire with its own consumption of air by a shaft to itself. Or it will take the air from the artificial ventilation and cause it to cease to act. Whereas with natural ventilation the fire sets it acting, takes the air from the room, and is the most valuable means of ventilation.
- Our grandfathers' lofty fire-places are the greatest loss in modern house architecture. The little low fire-places of this date bring the best current of air below the stratum in which we are breathing. With our system, to breathe the best air, we must not be more than six years old, or we must lie down.
- 10,040. What do you consider the best system of warming for a hospital, and why?
- Radiation ; open fire-places. Heated air from metal surfaces should never be used for warming. It has a tendency to produce disease of the lungs. The hot-house system of warming with a brick floor and brick flues is perfectly safe ; but an earthenware floor in hospitals, unless glazed, is inadmissible, because of the great absorption of water.
- In a ward of the size mentioned, 80 ft. by 25, two fire-places would probably be necessary.
- 10,041. Do you advise the establishment of additional general hospitals?
- Yes ; at Malta, Corfu, Gibraltar, London, Portsmouth, Aldershot, and perhaps at Shorncliffe and Fermoyle, there are sufficient bodies of troops for general hospitals to be formed ; and it would be most desirable for the interests of science, economy, and administration to establish on stations where larger numbers of troops than one regiment are collected, at home and abroad, permanent divisional or brigade hospitals, together with a permanent administrative staff of officers and subordinates, for the treatment of the sick of the station and of detachments within reasonable distance.
- The efficient hospital staff, trained under such an organization, would supply regiments going on foreign service.
- The medical staff would consist permanently of an inspector and deputy-inspector, the rest of the staff would not be permanent, because regiments change on the station. The complement of a regiment is one surgeon and two or even three assistant surgeons. One of these would be appointed to serve on the staff of the general hospital, one would remain with the regiment as sanitary officer, and the third might be set free on leave to go to some military general hospital for the purpose of study, for, say that there were five regiments, five surgeons would easily do the duty for the sick in a general hospital, where now, in regimental hospitals, it is the business of fifteen.

10,042. Do you prefer general hospitals to agglomerated regimental hospitals, and why?

The system of agglomerated regimental hospitals is no system at all, if it means merely assigning one or more wards in the same building to each regimental hospital, with the same kitchen to all, so that if there are ten hospitals, there may be ten surgeries, there are ten hospital serjeants, ten staffs of medical officers, ten of everything, while in one hospital there may be two severe cases, in another twenty.

The only theory of a general hospital which we heard during the late war was that of making it as much like a congeries of regimental hospitals as possible; and, though this theory neither was nor could be systematically carried out into practice, it remained and does still remain the theory, and prevents, as it then prevented, any attempt to devise a better and more practicable scheme. For,

1. The surgeon cannot be relieved of his multifarious non-professional duties.
2. No comparison of different treatments, with a view to the furtherance of science or the advancement of individual knowledge, can be made, while in the military medical service the organization remains exclusively regimental.

Without actual experience, indeed, it is evident that to divide a small number of sick into half a dozen hospitals, which have all to be kept up as complete and separate establishments, instead of uniting them into one, necessarily involves considerable waste of labour and expense.

It is contrary to every analogy in England. What should we say if every parish in Middlesex insisted upon sending its own lunatics under their own surgeon to be separately lodged in Hanwell Asylum? We should say no improvement in science, classification, or administration is here possible.

10,043. In what particulars is improvement impossible under the present exclusive system of regimental hospitals?

1. The management and internal economy of hospitals, cooking, washing, supply and issue of extras, &c.
2. The financial part of the service.
3. The professional and economical superintendence.
4. The organization and superintendence of the attendance department.
5. The supply and dispensing of medicines and medical appliances.
6. The introduction of proper baths, lavatories, &c.
7. The classification and treatment of particular diseases.
8. The imperatively needed organization of hospitals for soldiers' wives and children when sick, the want of which is most demoralizing.
9. The arrangements for the treatment of sick prisoners and others not belonging to regiments on the station.

In large permanent establishments only can these things be properly regulated.

10,044. How does this system affect the army medical officers?

The standard of professional service can never be raised among army medical officers under the regimental system.

For to do this, three things are necessary:—

1. Sufficient professional occupation.
2. Command over large numbers of cases of the same affections.
3. Opportunity for comparing results of different modes of treatment.

10,045. In what other ways does the existing system obstruct the progress and diffusion of medical science?

Under the present system,

1. No practice can ever be established as the best; the sick being treated in so many hundred hospitals by as many hundred surgeons.
2. No system of mutual information and clinical instruction can be established. Individual experience remains individual property, or is buried in official reports.
3. No professional specialties can be acquired. For there is no opportunity of collecting the necessary material for study, practice, and experiment in special diseases. Nor is the experience of one man shared by others.
4. No publicity can be introduced, bringing individuals and establishments into competition with their rivals in civil life and other armies.
5. No prizes, distinctions, or promotion for scientific and professional labours can be systematically introduced.

10,046. What are the principal objections to the regimental hospital or agglomeration of regimental hospitals?

1. The impossibility of professional progress.
2. The impossibility of any organization of government.
3. The impossibility of any organization of attendance.

The agglomeration of the regimental hospitals does not modify these evils any further than what was actually done in the Crimea, where the hospital huts of each regiment were placed as near as possible.

- 10,047. Can advantage be taken of the division of labour ?
- As to 2. and 3., the management and government of the regimental hospital are now entirely vested in the medical officer and hospital serjeant, under the military authorities. It is easy to see that no division of labour is possible. The duties of the hospital serjeant, by regulation, are so multifarious that it amounts to a physical impossibility for one man, however active and intelligent, to perform them all.
- He is Ward Master ;
Serjeant ;
Steward ;
Head Nurse ;
sometimes Dispenser ;
sometimes Purveyor's Clerk.
- The consequence is that there is no nursing, and no hospital discipline, in the sense in which these things are understood in a civil hospital.
- Again, the regimental system was shown to be in the Crimea utterly incapable of meeting the requirements of an army in the field under the circumstances, and yet we might never again be in circumstances in the field so favourable to the formation of regimental hospitals.
- When the general hospitals came to be formed, there were but two or three medical officers who had any idea of organizing a system for 1,000 to 2,500 sick.
- 10,048. What reasons are usually alleged in favour of the regimental hospitals ?
1. That the regimental surgeon knows all his men ; and
 2. That the sick soldier does not like to be separated from his regiment.
- 10,049. Are these reasons valid ?
- No ; only partially. 1. The fact of the frequent changes of the regimental surgeon, especially in time of war, is overlooked. Even promotion takes him away from his regiment. The hospital serjeant is frequently the only permanent officer. He sometimes knows all his men ; but often the surgeon does not.
2. As far as I have seen, nothing but evil comes of comrades lying together sick. They are depressed by each others sufferings or death. They are led to combine against hospital discipline. I incline to think that the task of governing a number of men in a civil hospital, who have never been under any discipline at all, and are there merely as casual inmates, is considerably facilitated by their being strangers to one another.
- 10,050. Is the regimental hospital system a preparation for organizing a general hospital in time of war ? And is it safe to depend upon an exclusively regimental system, when, in all emergencies, the general hospitals are what we must depend upon ?
- The primary necessity of management in institutions containing, say, 1,000 persons, is the reduction of departments to their smallest possible number, and the definition of their functions. This has not even been attempted. The nine departments of our war general hospitals have been described. Before a patient could eat his dinner in the Scutari general hospitals, it had to be manufactured through the medium of the commandant who assigned the orderlies and cook, of the engineers' department who repaired the kitchen, of the purveyor who supplied a portion of the food ; of the commissary who, through the contractor, supplied bread, meat, and fuel ; and of the soldier himself, who supplied, out of his own kit, some of the utensils for eating and drinking.
- A question of hospital repairs has been known to pass from the medical officer to the purveyor, thence to the principal medical officer, back to the purveyor, thence to the quarter-master general's department, commandant, engineers' department, and was ultimately decided upon without appeal to the informing judgment, viz., the surgeon in charge, who saw his patient suffering from (say) a leaky roof or broken pane of glass, without the means of redress.
- It is hardly necessary to state that it is not safe to depend on any system which leads to such results.
- 10,051. What has been your experience of the working of the present system of written requisitions, checks, and counter-checks ?
- This system of checks and counter-checks seems to have been invented for the purpose of saving money instead of for that of saving the lives of the sick. Now it fails in its object both ways, because the lives of men are of more money value to the country than any saving can ever by any possibility be in such matters ; and also because it actually wastes money for the clerk system and check system require such a staff as to cost far more than the additional supplies would do.
- No system can be more expensive than ours, for these reasons. It is also inconsistent with prompt and efficient action, and consequently hazardous to the sick.
- 10,052. Can you suggest any simpler and more efficient arrangement ?
- A governor, who should be responsible for everything ; a principal medical officer ; a steward, who should supply everything, like the agent in the naval hospitals ; a superintendent of hospital

attendants, who should overlook the whole attendance department; a treasurer; and a sanitary officer attached to the governor,—what more do we want? We must have regimental hospitals also. It is not meant to do away with a necessary, at all events, and, in some respects, an admirable system. But a medical officer must be conversant with both, otherwise, as surely as we again have war, shall we again break down in our general hospitals.

10,053. Has experience established the necessity of general hospitals?

Yes.

It does not appear necessary to discuss whether there ought or ought not to be general hospitals, because there must be general hospitals. If they are an evil, let the evil be made as light as possible by good organization; if they are good, let them be made as good as possible.

But, in what war have our general hospitals not been a signal failure? In the early part of George II.'s reign, at Coimbra, and, most fatal example of all, in the late war.

10,054. If this has been the case, and if this always will be the case, reasoning from the past, is it not advisable at least to go into the question of constituting a scheme of government for general hospitals?

Certainly.

General hospitals, at the base of operations, when this is at a distance from the army, must necessarily fall through, between the two authorities, the commander of the forces engaged in active operations, and the departments at home, unless there is a governing head with commensurate responsibility on the spot.

If it is said that the general officer commanding in the district is the governing power, it is obvious that the commander of the forces will give the man least wanted and least efficient in the front for this purpose; whereas, if a governor for the hospital itself were appointed from home for his known powers in administration, the man most efficient might be sent.

10,055. Ought not the principal medical officer to be the governor?

Not if it can be avoided. It is obvious that the real object and glory of the medical profession are medical skill and practice; and, if a good medical officer be put to do something else, his services are lost in that which he has spent his life to acquire.

But experience is the true test, and if the experience of the failure of the Scutari hospitals will not teach us at least to discuss the question, no argument stronger can be used.

10,056. How should the general hospital be governed and organized?

An executive head, who is there on the spot to answer for failure whose business it is without any question to govern this institution and nothing else, with power corresponding to the responsibility, which is his, and no one's else, this is what we seek in all similar known institutions. He ought to have full power to obtain

Labour,
Transport,
Supplies.

Labour he must have power to hire, when not obtainable from the military train, also transport, as far as land is concerned, when not obtainable from the land transport corps; the sea transport he must have from the admiral on the station. Supplies he must have power to obtain without reference to the commissariat, who are not responsible.

Whether his steward is to be a commissariat officer, detached for the purpose, or an officer from a different service, it is not my province to discuss.

But it cannot be disputed that the articles of supply for a hospital are different from those for an army. The French take a different bread for their hospitals. We are allowed to give 1d. per lb. more for our hospital meat.

It cannot be disputed that it is better to let the responsibility for all supplies rest upon one person than upon two.

10,057. What is the difference between a civil hospital and an agglomeration of regimental hospitals?

The former has one treasurer, who administers the finance of all the wards. It has one committee, who manages the supply of all the wards. It has one secretary, who manages the correspondence for all the wards. It has one house governor or superintendent for all the wards; one kitchen which cooks for all the wards; one laundry which washes for all the wards; one surgery; one apothecary; one pharmacy and laboratory for all the wards; one set of attendants, under one head; one set of accounts; one system of supply. It has one set of officers; one operating theatre; one dissecting room.

There is not a bad case in the hospital which may not have the advantage of the advice of all the best officers in the institution; there is not a surgeon or physician who may not be called into consultation by all the rest. I have never known an instance where the interests of a patient were sacrificed to the interests of an individual officer. So strong is the

- professional spirit in civil medical life that the experience of each man becomes the common property of all the rest.
- I have recently heard it stated, for the first time, that each civil surgeon is situated as regards his ward precisely as a regimental surgeon is in his hospital. I am bound to record, as strongly as I can, that the reverse has been my experience in a great variety of instances.
- 10,058. What peculiar advantages would the patient enjoy in general hospitals well organized?
- In general hospitals, there can or ought to be no difficulty in obtaining all that is necessary for the patient. In all regimental hospitals, it is impossible for the regimental surgeon to obtain all that he wants for his patients; unless there is such a staff for each regimental hospital of 50 patients, as there is, or ought to be, for a general hospital of 500; which is manifestly impossible.
- 10,059. What is the real objection to general hospitals in the minds of army medical officers?
- A most legitimate and unanswerable one under the present system. A regimental surgeon is master, as he ought to be, of his own practice in his regimental hospital. The practising surgeon in the general hospital practically is not. Both are subject to inspection, but practically the difference is great. With the slightest knowledge of human nature, with the commonest sense, it is obvious that the inspections, as now conducted in general hospitals, the system of superintendence and subordination of scientific acquirement to rank, must destroy in a man his sense of responsibility, and (the most important quality, the latest acquired, in a man of action, which a medical man must be) his self-reliance. Therefore, do surgeons under the present regime most reasonably and justly prefer being regimental surgeons.
- 10,060. What are the legitimate objects of inspections?
- Inspections ought to be merely for the purpose of collecting facts, with the view of enabling the authorities to act upon them. Your whole purpose in educating and examining the medical officer is to fit him for medical practice. If he is not fit to practise, he is not fit to be a medical officer; and yet, you would subject him to weekly interference in his practice and in petty details much better left to himself. The only rationale of superintendence is, when it comes from a superintendent better qualified than the superintended, which the treating surgeon, in the army medical department, does not feel to be the case in most instances. For the superintendent has, in most instances, ceased to practise.
- 10,061. Are any peculiar views of their proper sphere of action entertained by any section of army medical officers?
- There is a portion of the army medical department who like to keep the housekeeping and book-keeping in their own hands. This is a very small portion. But they do not consider how impossible it is to raise the true dignity of the department, to attract the best men into it, as long as this is the case. To make high-priced labour do what low-priced labour can do, to make men at 7s. 6d. a day do what men at 1s. 6d. a day could just as well perform, is the true way to degrade a scientific department. And I do not see how it is possible, without the organization of large permanent establishments, in which alone a proper administrative staff could be trained, to make the army surgeon other than a sort of maid of all-work.
- 10,062. Are the confidential reports attended with any evil consequences?
- The evil inflicted by them is not so much the injury to individuals, severely as this is sometimes felt, as the lowering of the whole moral tone of the department, the danger of depriving a man of his conscientiousness, his sense of responsibility, his true dignity. For army medical men are like all other medical men. And such interference with their practice and their reputation would be fatal to all. No increase of pay will raise the department while these things are suffered to exist.
- 10,063. What is the best class of men to be recruited for the medical staff corps?
- Discharged soldiers or civilians of good character. They should always be men who can read and write.
- 10,064. In what manner would you propose to have them instructed in their duties?
- If they are to nurse, unquestionably they should be instructed in the duties of nursing, as also in those of cleaning, &c., by head female nurses, who understand these things. To the superior ranks, a few simple anatomical lectures might be given by the medical officers. Dispensers must, of course, be suitably educated, if they are to dispense.
- 10,065. What are the duties of the orderlies attending on the sick? And what would you propose to be the respective duties and relative position
- The administration of food and of medicine, the making of poultices, and application of the minor dressings, should always be in charge of the head nurse. Under her, the cleanliness of the ward, bed, bedding, and utensils of the patients, as well as

of the nurses and orderlies employed in the same wards ?

his personal cleanliness ; the fetching of diets, the warming and ventilation of the wards are to be attended to by the orderlies, but always under the nurse's surveillance. And she is to have the power of reporting disobedience on their part.

10,066. What should be the proportion of orderlies to sick ?

Not less than one to each seven sick, exclusive of the female head-nurse. I am not speaking of convalescents.

10,067. How long would you keep a man on duty in the ward ?

Not more than eight hours. Watches of four hours are good, thus :—

1st orderly 4 a.m.—12.

2nd „ - - 8 a.m.—4 p.m., or 6 a.m. to 2.

3rd „ - - 12—8 p.m.

1st „ - - 4 p.m.—8 p.m.

2nd „ - - 8 p.m.—12

3rd „ - - 12—4 a.m.

1st orderly sleeps from 8 p.m.—4 a.m., and has from 12—4 p.m. off duty.

2nd orderly sleeps from 12—8 a.m. and has from 4—8 p.m. off duty, or sleeps from 12—6 a.m., and has from 2—8 off duty, of which a part should be spent in rest.

3rd orderly sleeps from 4 a.m.—12, and has from 8 p.m.—12 off duty.

From 8 p.m.—6 a.m. there is but one orderly on duty.*

The nurse might be on duty from 7 a.m.—1 p.m.; off duty from 1—5 p.m.; on duty from 5—11 p.m.; off duty from 11 p.m.—7 a.m.†

Of course, if she is a trustworthy woman, she will be much in her ward in the intervals, especially if she have bad cases.

10,068. How would you provide for the discipline and regulation of the orderlies ?

What duties should you assign to the ward-master ?

What proportion of ward-masters to the number of orderlies employed ?

There should be a ward-master for every three or four wards, whose whole business should be to see to the regulation and discipline of the orderlies, and to the enforcing obedience to the orders of the nurse. But it is obvious that if the nurse is not in authority in regard to all that concerns the patient, her duties will become impossible. If she is in authority, the orderlies will willingly obey.

It should therefore be compulsory that she should report a refractory orderly to the ward-master.

The ward-master should be in charge of all returns, accounts, states, diet-rolls, &c., so as to set the nurse completely at liberty to attend to her ward.

10,069. What objection is there to the hospital with a long corridor and small wards ?

The least administrable form of hospital is the long corridor with wards of from eight to ten patients, opening off one side. Attendance, meaning of course due attention to the patients, becomes almost impossible. The above plan contemplates a ward of 21 patients, where one orderly sitting up, each for a watch of four hours during the night, is amply sufficient. But how to provide attendance suitably superintended, especially at night, for wards of eight to ten patients, I confess I do not see.

10,070. How do you propose to obviate the evident danger of collecting a great number of sick men, labouring under diseases of every kind, into one large building where they breathe a common atmosphere ?

The French break up their general hospitals into separate blocks, while we sometimes agglomerate our regimental hospitals into one building, thus *reversing* the sanitary law.

The Lariboisière hospital at Paris has 600 patients under six roofs ; and we had in the Crimea accommodation for 500 or 600 patients at the Castle hospital in from 20 to 30 large and small huts.

One administration, in both cases, for all.

This is the true principle. All that has to be manufactured, as the cooking, washing, &c., should be, as much as possible, concentrated into one ; while human beings, sick or well, should be distributed as much as possible.

In London, one wash-house‡ will do for a number of families, and is as good as giving an additional room to each ; but this does not break up our house system and convert London into a gigantic public institution.

* Orderlies, Nos. 2 and 3, must take it every second day to be on duty an additional two hours, from 6—8 a.m., a time when two orderlies are certainly wanted. If the second arrangement be adopted it has the advantage of giving two orderlies after 6 in the morning for cleaning and arranging the ward. The second method obviates the necessity for the additional two hours duty in the morning.

† It is, however, impossible to lay down the nurse's hours absolutely. They must vary, according to the conditions of the hospital. None but the female superintendent can judge of this. A scheme of hours is given here only to show the importance of affording the nurse, if possible, 8 hours for sleep and personal cleanliness ; 2 hours for exercise, which should never be exceeded without written permission from the matron ; 2 hours for her making, mending, &c. For a nurse in her ward ought always to be *on duty*, never sitting down to her own personal work, or making *one of the party*. A good hospital nurse is a sentry on duty, within sight of the enemy's lines, and no relaxation of discipline can be excused. But to be this, she must have time allowed her to herself.

‡ It is found to be good policy not to mix the linen of different households.

NOTE A.

No. 47.—Lord RAGLAN to Lord PANMURE.

(Received March 20.)

(Extract.) Before Sebastopol, March 3, 1855.
I beg now to lay before your lordship Dr. Hall's report of the state of the sick, and I will direct him to make one weekly, which I will transmit for your lordship's information.

(Enclosure.)

Dr. HALL to Lord RAGLAN.

My LORD, Before Sebastopol, March 19, 1855.

In transmitting the weekly state of sick of the army to the 17th instant, I have the honour to state, that though the sickness still amounts to 14·31 per cent., the mortality does not exceed 0·51 per cent., which is a proof that the diseases are milder in character; and I think I may safely say the general health and appearance of the men is greatly improved; and had not the duty, by the unavoidable operations of the siege going on, been increased of late, I think the sick list would have been still more diminished, as the men's condition is in every other way so much improved, both in diet, dress, and accommodation.

(Enclosure.)

Dr. HALL to Lord RAGLAN.

My LORD, Before Sebastopol, April 3, 1855.

In transmitting the weekly state of sick to the 31st March, I have the honour to state, that I am sure it will be pleasing to your lordship to learn, that the general health of the army continues steadily to improve; and although fevers and bowel complaints continue to prevail, they are both assuming a milder character, and the latter are of much less frequent occurrence.

During the present week the admissions to strength have been in the ratio of 3·93 per cent., and the deaths to strength 0·38 per cent.

Last week, the admissions to strength were 4·35 per cent., and the deaths 0·52 per cent.; which makes a decrease of 139 in the admissions, and 43 in the deaths during the week.

(Enclosure.)

Dr. HALL to Lord RAGLAN.

My LORD, Before Sebastopol, May 28, 1855.

The enclosed weekly state of sick to the 26th instant, I am glad to say, shows an improvement in the sanitary condition of the army. The cases of cholera which have been admitted during the week have been of a milder character, and the mortality from that disease has been much less; but it has extended to the Sardinian contingent, to the men of the land transport corps, and to the shipping in the harbour of Balaklava, and, from these sources, the admissions and deaths in the general hospital there have been considerably increased; no fewer than eighteen out of the twenty-five casualties which occurred there, having taken place amongst these extra patients. In future, I will have the extra patients excluded from the weekly state and shown separately; but as I cannot get fresh returns made out in time for the post on the present occasion, I have deducted the numbers from the general return.

The admissions to strength during the present week, have been in the ratio of 4·20 per cent.; and the deaths to strength, 0·27 per cent. Last week they were 4·53, and 0·47, respectively.

Fevers have been less numerous during the week, but diarrhoea has been slightly on the increase; and it

has been noticed that many convalescent from fever have been seized, in some of whom the disease has run on to cholera and terminated fatally.

I have, &c.

J. HALL,
Inspector General of Hospitals.

Dr. HALL to GENERAL CODRINGTON.

Head Quarters, Camp, Crimea,
December 31st, 1855.

The following abstract shows the admissions and deaths during the week, and those during the previous week.

	This week.		Last week.	
	Admitted.	Died.	Admitted.	Died.
Fevers - - -	182	15	173	16
Head Affections - -	9	2	2	2
Chest ditto - - -	279	0	221	1
Diarrhoea - - -	117	3	204	4
Cholera - - -	3	3	12	7
Dysentery - - -	8	1	40	0
Rheumatism - - -	44	2	58	1
Frost Bites - - -	98	0	269	1
Wounds and Injuries -	72	4	48	6
Ophthalmia - - -	37	0	22	0
Other diseases - - -	425	6	374	2
Total -	1,274	36	1,423	40

I have, &c.

J. HALL,
Inspector-General of Hospitals.

NOTE B.

I have carefully compared all the statistics from six different official sources. I will here put in four sets of returns.

I.

Name of Ship.*	Deaths according to		
	Cumming-Maxwell Return.	House of Commons Return.	Adjutant's Return.
Kangaroo - - -	—	22	—
Dunbar - - -	22	10	30
Cambria - - -	—	21	—

Echunga - - -	7	6	1
Palmerston - - -	—	7	5
&c., &c., &c.	—	—	—

* The above comparison is made, taking the first seventeen ships in order, as their names stand in the returns.

In the Adjutant-General's Return from the Crimea, it will be seen that the total number of "deaths in the infantry, from October 1, 1854, to May 1, 1855," "on board ship or elsewhere" (meaning not at Scutari or in the Crimea), is 715.

Returns from the medical officers of each corps in the Crimea, and from the inspector-general of hospitals at Scutari, as collected by Sir A. Tulloch, show that during the same period, the number of deaths in cavalry, artillery, and royal engineers, was, to those in the infantry, as—

	Crimea.	Scutari.
Infantry	4,963	4,052
Cavalry		
Artillery	378	470
Engineers		

The mortality on board ship, including all arms of the service, is, from September 15, 1854, to February 11, 1855, according to—

Cumming- Maxwell Report.	House of Commons Report.	Scutari Adjutant's Report.
923	915	888

II.

From Returns of Adjutant's Office at Scutari.
Recapitulation.

Months.	No. of Burials in each month.	No. of Deaths reported in each month.	Excess of Burials over Deaths in each month.
September 1854	165	78	87
October "	266	219	47
November "	368	291	77
December "	667	536	131
January 1855	1,473	1,360	113
February "	1,151	1,076	75
March "	418	416	2
April "	165	152	13
May "	76	76	
	4,749	4,204	545

Remarks.—517 of the 545 have been struck off the strength of the general dépôt, the other 28 were men brought ashore either dead or insensible, with no marks to ascertain their names or regiments.

III.

In these returns the director-general himself uses the same figures for the "total number of men of Lord Raglan's army sick," and for the "total number of sick and wounded treated at Scutari."

APPENDIX to REPORT from the SEBASTOPOL COMMITTEE, 2nd Report, p. 705.

RETURN showing the TOTAL NUMBER of SICK and WOUNDED treated in HOSPITAL at SCUTARI.

Months.	Total treated.
During November 1854	16,846
" December 1854	19,479
" January 1855	23,076

A. SMITH, M.D., Director-General.

13, St. James's-place,
29th March 1855.

APPENDIX to REPORT from the SEBASTOPOL COMMITTEE, p. 470.

No. 1.—RETURN showing the TOTAL NUMBER of MEN of Lord Raglan's ARMY SICK during each MONTH, from the Landing in Turkey.

Months.	Total Sick or Wounded of all Arms during each Month.

	—	4,229	4,508	4,050	3,820	4,522
	At Scutari and Koulali.		At Scutari.			

* Being Cavalry, Artillery, and Royal Engineers.

The above are the returns from different official sources. The discrepancies in them will no doubt be explained to us at some future time. Smyrna is not included. The Smyrna hospital was opened to sick February 15, and from that day till March 31, 127 deaths occurred, by the inspector-general's return. Returns 1 and 2 purport expressly to be for Scutari and Koulali. Returns 3, 4, 5 to be for Scutari alone. Return 6 may include Smyrna. Otherwise, being for the "infantry" alone, it would prove, in defiance of Euclid, that a part is greater than the whole. For the deaths in the month of March of infantry alone are greater than those recorded by the other returns in March for all arms of the service. However, the Smyrna supposition does not account for the difference to those unacquainted with these matters—as return 6 is

something less than return 2 (the medical return) for February, although something more for March—

For the first four months in Return 2, read—

October 1 to November 4	-	-	250
November 5 to December 2	-	-	267
December 3 to December 30	-	-	393
December 31 to January 31	-	-	1,235

Another principal medical officer's return shows from October 1 to November 4 - 258, being a trifling difference between the two principal medical officers, easily explainable. According to the latter, the return of deaths is—

October	-	-	-	231
November	-	-	-	279

But had this return been taken, December 1 and 2 would have been omitted.

The "medical return" (2.) for April is only up to April 28, yet exceeds by 35 the head-roll of burials, which is till April 30.

All other figures are copied absolutely as they were found in the different returns.

Some light may be thrown upon the discrepancies in the medical returns, when it is mentioned that, up to a period variously stated as sooner or later than February 1855, the medical returns of deaths were made up from the purveyor's diet rolls, upon which the name of the dead man appeared as scratched out, and from verbal or imperfect reports made by the medical officers in charge; that no bed-tickets existed up to this somewhat obscure period; and that it appears uncertain at what period the medical officers were required to fill up regular returns of deaths. I am led to believe this from evidence collected on the spot.

Returns 1 and 2 purport, as has been said, to be for both Scutari and Koulali. Nevertheless the numbers are sometimes greater, sometimes less than returns 3, 4, 5, which purport to be for Scutari alone. Returns 1 and 5 show the same for February 1855, although purporting to include different places.

Koulali was opened December 2, 1854, but the maximum of patients during that month was 240 only. In February the deaths there were 52 per cent. on cases treated, and 608 per cent. per annum on sick population.

NOTE C.

Extra-Diet Kitchens.

The kitchen apparatus of the barrack and general hospitals, as left by the Turks, consisted of thirteen large copper boilers in the former building, and eleven in the latter, set in brickwork, eight and five of which only, respectively, were available with safety.

In the general hospital the brickwork was loose, and the fuel was supplied from within the building, so that the kitchen was filled with smoke and the cooking impeded. This state of things continued till after the arrival of M. Soyer, in April, 1855, when the engineer officer set the boilers properly, and placed the flues so that they could be lighted from without—at the same time open charcoal stoves were placed, according to M. Soyer's directions, for the cooking of extra diets, heating coffee, &c.

In the barrack hospital the kitchen was at one end of the yard, with no other arrangement in use than the above-mentioned boilers, which were, however, perfectly well set, and supplied with wood placed in fire-places, the opening of which was on the outside. The kitchen was twenty yards from one end of the barrack yard, and 200 yards from the other; the barrack yard being 220 by 194 yards; the corridor, therefore, which was in the internal side of the building, was about half a mile in extent. External to it were the wards, with their windows in the outside of the building. A tower of several stories rose at each of the four angles of the building, which was placed upon a very steep slope. The mass of the patients was ranged on one flat and part of two other flats. In the winter of 1854-5, they varied from 1,900 to 2,500. The corridors had two rows of beds, placed transversely, leaving a vacant space along the centre of about three feet. The beds, measured

across, with the intervals between them, extended over a space of from three to four miles, including, of course, both wards and corridors. As the eight coppers above mentioned, placed in one kitchen, had to supply three meals a day for this vast number, the issue was necessarily but slowly conducted—it occupied from an hour to an hour and a half. The meat was issued from the purveyors' store, at one office only, nominally between 9 o'clock and half-past 12, but the last of the meat was rarely brought into the kitchen before 1½ p.m. As soon as it was received by the orderlies, each carried the portion intended for his own mess or ward to the kitchen, and placed it in the copper, with some distinguishing mark (occasionally of very peculiar description), which was called a "tally." The nominal hour for dinner was one o'clock, when the portions were supposed to be cooked, and were re-delivered to the orderlies; and as no order of precedence was observed among them, it might thus easily happen that some of the portions remained three hours, and some not above half an hour in the coppers. The meat, after it had traversed the corridors, was divided into the required number of diets by the orderly, upon his own bed, and then distributed to the patients. The real hour of dinner was 2, 3, or even 3½ p.m.

No attempt at extra diets had been made except that of cooking arrowroot in one copper and fowls and chicken broth in another, or in tin pots on Turkish braziers. The orderlies cooked some small articles for the patients in their own mess-tins.

Under these circumstances Miss Nightingale established an extra-diet kitchen, in November 1854, which continued in action up to July 1855. Four cooks were employed in it, besides which, arrow-root, puddings, lemonade, &c., were prepared during the whole time in the nurses' kitchen, for the patients.

The regulations for military hospitals contain five diets, being "full," "half," "low," "milk," and "spoon." When the latter diet is ordered, consisting of 1 pint of tea and 4 oz. of bread for breakfast, and the same for tea, any articles may be ordered at the discretion of the medical officer, for the patient's other meals—these articles are then called "extras."

Under this regulation the medical officers drew for patients upon spoon diet (daily), "extras" on diet rolls for 700 to 800 men upon this kitchen.

The extra diet rolls were necessarily carried away with the diets, to ensure a proper delivery by the orderly, and were returned to the ward for the medical officer to form his diet roll next day.

In making the issues, therefore, the superintendent had only to comply with the diet rolls presented, which did not return to her hands. The following extract from a parliamentary document will exhibit the ordinary demand.

AVERAGE DAILY ISSUE of extra Diets supplied from F. Nightingale's Kitchens to the Extra-diet Rolls of the Medical Officers, Barrack Hospital, Scutari, from the 13th January 1855 to 13th February. Vide p. 41 of "Report upon the Scutari and Crimean Hospitals," by the Cumming Maxwell Commission.

No. supplied.	—	From Public Stores.	From Private sources.
25 gallons -	Beef tea.	80 lbs. beef.	—
15 " -	Chicken broth.	28 chickens.	12 chickens.
40 " -	Arrow-root.	—	Arrow-root.
15 " -	Sago.	—	Sago.

3 " -	Brandy.	—	Brandy.
15 lbs. -	Jelly.	—	Isinglass.
4 dozen -	Eggs.	—	Eggs.
40 " -	Chickens.	28 chickens.	12 chickens.

"The average daily issue table," though a fair average for the three months of December 1854, January 1855, and February 1855, by no means reaches the amount of the issues of the end of December and beginning of January. For instance, in the return of issues for articles consumed in extra diets, from December 19, 1854, to December 31, 1854, in one division (viz. D) alone of the barrack hospital, containing 519 sick, appears an issue of 108 bottles of port wine mixed in the daily arrow-root from Miss Nightingale's kitchen.

A second extra-diet kitchen had been constructed by her in aid of the first about Christmas 1854, and three supplementary boilers for supplying hot water for arrow-root, &c., were also set upon one of the staircases at her request.

A third of these kitchens was afterwards added by a first-class staff-surgeon, in charge of one of the four divisions of the hospital.

At the general hospital, in consequence of the difficulties said to exist, a modified system was adopted, until the extra diets began to be cooked in the general kitchen arranged with M. Soyer in April 1855.

M. Soyer was also permitted to arrange extra diet kitchens at Haida Pacha and at Koulali.

At the five general hospitals attended by female nurses in the Crimea, extra-diet kitchens, in which they were, for the most part the cooks, were introduced under the female superintendent.

The arrangements of the extra-diet kitchen in the castle hospital at Balaklava having been formed at a later period, and when the purveyor's stores were more fully provided than when the establishments at Scutari commenced, were in some respects to be preferred, as interfering less with the ordinary rules of supply in military hospitals, and consequently imposing less responsibility on the female superintendent. In the case of many of the articles which enter into the extra diet-rolls, as "mutton chop, fowl, preserved meat," it is obvious that no saving is effected by drawing *en masse*, the portions allotted to several individuals; these were accordingly sent in by the purveyor according to the diet roll of the day without requisition, the only advantage arising from their being cooked in the extra-diet kitchen being, in the words of the purveyor, "that they were so much better done." But in the case of articles which are to be compounded, as sago, arrow-root, rice, or eggs, sugar, milk, &c., for puddings, or the materials for barley-water and lemonade, a very great saving is effected by drawing *en masse*; and for these articles, accordingly, the superintendent drew upon requisition, distinguishing, however, such requisitions from those drawn for the supply of the nurses, and having both countersigned by the medical officer. To supply from private sources most of the articles above mentioned would have been superfluous and justly unacceptable to the government. Butter, being a new and exceptional article, was of course supplied from private sources when ordered by requisition of the medical officer. A quantity was despatched by Her Majesty, and was placed by the purveyor in the charge of the superintendent, to be disposed of in conformity with the above regulation.

The consumption of the nurses can be proved to have been throughout rigidly moderate, according to the plainest frugality consistent with the preservation of full health and strength. It was considered needless to depart from the rule of letting the purveyor supply the staple articles, such as bread, meat, porter, candles, fuel; but arrow-root, wine, and spirits, when required (with few exceptions), and at Scutari many other articles, as tea, milk, butter, were supplied from private sources.

In consequence of the absence of any provision for sick and wounded officers in hospital, by the War Office regulations, the cooking for their service, in the castle and general hospitals in the Crimea, was entirely done by the female staff; part also of the

materials for their use being supplied from private sources. And, by the express desire of the medical officer in charge, the superintendent drew for the sick officers wine, bread, and meat, under the head of nurses' supplies, although not consumed by the nurses.

Taking it for granted that it is neither the wish of the government nor of the people of England, that the soldier in hospital should go back to the condition of "former wars," and presuming that he is to be treated with that degree of decency and humanity which the improved feeling of the nineteenth century demands, the above statement furnishes perhaps some reason for concluding, that this treatment is supplied in many particulars, not only more efficiently, but also more economically by the system above described, than it could otherwise be afforded.

NOTE D.

NUMBER of SHIRTS found in PATIENTS' KNAPSACKS that are deposited in the Pack Store of the Barrack Hospital at Scutari.

Twenty-two.

SELKIRK STUART,
Purveyor to the Forces.

4th December 1854.

RETURN of the NUMBER of SHIRTS issued from the PURVEYOR'S STORES in the GENERAL HOSPITAL and BARRACK HOSPITAL at SCUTARI, from 1st October 1854 to 16th February 1855.

Issued.	To General Hospital.	To Barrack Hospital.	To Kulali.	To Haidar Pasha.	To Miss Nightingale.	Total.
From store at General Hospital - -	4,203	—	—	512	1,000	5,715

" 5	2,000	4,000	—	—	—	360	From Quartermaster-General.
Total	9,269	7,990	11,306	4,086	600	1,960	

Of the above clothing there has been served out to the men of the General Depôt, and to invalids proceeding to England, since the 5th December, as follows :—

Date.	Shirts.	Drawers.	Socks.	Mitts.	Trowsers.	Boots.	—
	4,387	3,088	6,703	1,500	300	1,930	and 1,530 blankets.

JASPER HALL,
Captain 4th K.O. Regiment,
Scutari, 15th February 1855. Qr. Mr.

The store was established when the first articles of clothing were received, viz., on the 5th December 1854, as above.

JASPER HALL, *Captain 4th Regiment, Qr. Mr.*

MAJOR SILLERY.

"I was commandant from the time the army left till within ten or twelve days. When convalescents or invalids leave the hospital, they come under my command. *Many of the sick and wounded men arrived with little or no clothing. From the want of any establishment for the purpose at this depôt, there is*

the greatest difficulty in supplying such men with necessaries. There is a non-commissioned officer of each regiment here in charge of the men of his own regiment. It is the duty of that non-commissioned officer to meet the wants of the men if possible, getting the money for the purpose from the paymaster, who stops the amount from the soldiers' pay. The corporal must get the shirts when he can. In the case of boots, which are a heavy article, there is more difficulty. We cannot get the regimental boots here. For men going up to the Crimea, we look very closely as to boots. Till the last draft we sent up about a fortnight ago, we generally got boots from the commissariat for men going up; but I do not know if we got any for invalids. Every man is examined before he goes to the Crimea or home, but not when he comes out of hospital. We endeavour to complete the outfits as much as we can. This is done partly out of commissariat stores and dead men's effects. In the same way we give the red coatees of dead men.

"We want a quartermaster's establishment,—a large store with necessaries of all kinds. The complication of accounts with so many soldiers of different regiments requires a large staff. In a regiment, a soldier who wants anything is supplied by his captain, who inspects him and draws the articles wanting from the quartermaster's stores. Here we have no officer who discharges the duty of a captain."

APPENDIX.

CONTENTS OF APPENDIX.

	PAGE		PAGE
I. Regulations for candidates for the appointment of Assistant Surgeon in the Royal Army - - -	399	XXIV. Ration of the European soldier in India - - -	425
II. Ditto, Ditto, in the Royal Navy - - -	400	XXV. 1. French ration in the Crimea - - -	425

IV. Certificate required of Naval Assistant Surgeons before promotion - - -	401	XXVI. Ration for duty men of the Russian Army - - -	425
V. Affiche of the Ecole Impériale de Médecine et de Pharmacie Militaires - - -	402	XXVII. Statement of the rates of stoppage for rations, and the several articles at present furnished, together with the dates at which the various changes have been made in the stoppage, the nature of the ration, and the mode of supply, since the termination of the Peninsular War -	426
VI. Returns relative to the Medical Department of the Royal Navy :-		XXVIII. Memorandum by Sir Charles Trevelyan on the subject of stoppages from the pay of the soldier -	428
1. Number of Assistant Surgeons who entered in each year from 1848 to 1852 inclusive - - -	403	XXIX. Estimated cost of the extra articles proposed to be provided as part of the soldier's ration, by Commissary-general Adams, C.B. - - -	428
2. Number of Medical Officers on full pay on 1st April 1857 - - -	403	XXX. Scheme of diets for the soldier, proposed by Colonel Sir A. M. Tulloch, K.C.B. - - -	428
3. Number of Medical Officers on half-pay, on 1st April 1857; distinguishing those on the active, and on the retired list - - -	403	XXXI. Estimate of the probable cost of Sir A. M. Tulloch's scheme of diets - - -	429
4. Tabular statement of the rates of pay and half-pay of the different grades - - -	403	XXXII. Observations by Dr. Christison on Sir A. M. Tulloch's proposed scheme of diets - - -	430
5. Scale of retiring allowances for Medical Inspectors and Deputy-Inspectors - - -	403	XXXIII. Observations by Dr. Christison on a report by Sir John McNeill relative to the rations for soldiers -	431
VII. Returns relative to the Army Medical Department:-		XXXIV. Articles of clothing furnished to the soldier -	433
1. Number of Assistant Surgeons appointed in each year from 1848 to 1852 inclusive - - -	404	XXXV. Return showing the amount of barrack and hospital accommodation in the United Kingdom, with the number of men apportioned to each room or ward, and the cubical space allowed for each man, in 1848 -	439
2. Number of Medical Officers on full pay on 1st April 1857 - - -	404	XXXVI. Return of the barrack and hospital accommodation erected in the United Kingdom since 1st January 1847, with the number of men allotted to each room or ward, and the cubical space afforded to each man -	443
3. Number of Medical Officers on half-pay on 1st April 1857 - - -	404	XXXVII. Return showing the cubical space afforded to each man in each of the guard rooms in the London District - - -	447
4. Number of Medical Officers on retired pay on 1st April 1857 - - -	404	XXXVIII. Regulation as to cubical space allowed in barracks and hospitals at home and abroad - - -	447
5. Statement showing the daily rates of full pay of Medical Officers - - -	404	XXXIX. Replies to queries respecting the arrangement of the beds, and the system of ventilation in 1. Metropolitan, 2. Provincial, 3. Naval, and 4. Military hospitals in the United Kingdom - - -	447
6. Statement of the daily rates of half pay and retired pay of Medical Officers - - -	404	XL. Extract from the Report of the Building Committee of the Newcastle-upon-Tyne Infirmary - - -	454
VIII. Return showing the strength of Medical Officers on full pay on 1st April of each year, from 1st April 1839 to 31st March 1854, and the deaths which have taken place among them in each of those years - - -	405	XLI. Note on artificial systems of ventilation and warming in the Parisian hospitals by Dr. Sutherland; with a plan of Lariboisière hospital at Paris - - -	457
IX. Return showing the mortality of the Medical Officers serving with the Army in the East from 1st May 1854 to 30th April 1856, and the number of officers of each rank who died - - -	405	XLII. Note by Mr. Martin on the construction of barracks and hospitals - - -	461
X. Return showing the number of Medical Officers on full pay on 1st July 1857, and the rates of pay and half-pay :-		XLIII. Papers showing the necessity for a New General Army Hospital, which were submitted to Lord Panmure by Dr. A. Smith in January 1856 - - -	461
1. As authorized by the present Warrant - - -	406	XLIV. Copies of correspondence on the subject of a Military Lunatic Asylum - - -	466
2. As proposed by Dr. Smith to Mr. Stafford's Committee - - -	406	XLV. Tables showing the admissions and discharges from the Lunatic Department, Haslar Hospital, for 10 years, 1836-47. 1. Of officers. 2. Of seamen and marines	467
3. As proposed by Mr. Alexander to the Commission - - -	407	XLVI. Lunatic Asylums; proportion of cures to admissions - - -	468
XI. Return of the number of Medical Officers on half pay on 1st April 1857, distinguishing their ranks and the various rates of half pay - - -	408	XLVII. General Abstract of the services of patients admitted into the Lunatic Ward, or Receiving House, Chatham, from September 1853, till July 1857 -	468
XII. Returns relative to the Medical Department of the East India Company:-		XLVIII. Correspondence relative to the transport of sick and wounded from the Crimea to England - - -	469
1. Number of Assistant-Surgeons appointed in each year from 1848 to 1852 inclusive - - -	409	XLIX. Memorandum concerning ambulance conveyance -	470
2. Number of Medical Officers on full pay on 1st April 1857 - - -	409	L. Transport for hospital field equipment, comforts, medicines, &c. - - -	471
3. Number of Medical Officers on retired pay on 1st April 1857 - - -	409	LI. Return showing the average strength and deaths of the officers, non-commissioned officers and men serving in the army in each year from 1839 to 1853 inclusive -	474
4. Statement of the daily rates of full pay and half-pay of Medical Officers - - -	409	LII. Returns from the Royal Artillery :-	
XIII. Historical memorandum relative to the pay of Army Medical Officers - - -	409	1. The average strength and total deaths in each year from 1st April 1839 to 31st March 1854 inclusive - - -	474
XIV. Copies of correspondence from the governing bodies of the Universities and Royal Colleges of Physicians and Surgeons of England, Ireland, and Scotland, relative to the insufficiency of the present position, pay, and retirement of the Medical Officers of the Army -	410	2. The number of men discharged as unfit for service during the period - - -	474
XV. Paper relative to the grouping of Stations for the purpose of promotion - - -	413	LIII. Returns from the corps of Royal Sappers and Miners :-	
XVI. 1. Nominal return of the Regimental and Second-Class Staff-Surgeons on full pay on 1st July 1857, having less than ten years full-pay service (exclusive of the Household Brigade) - - -	413	1. Strength and deaths in each year from 1st April 1839 to 31st March 1854 inclusive - - -	475
2. Nominal return of Assistant Surgeons having upwards of ten years full-pay service (exclusive of the Household Brigade) - - -	414	2. Number of men discharged as unfit for service during the same period - - -	475
XVII. Minute by Lord Dalhousie on the Medical Department of India, and the orders of the Home Government upon it - - -	414	LIV. Returns from the Royal Marines :-	
XVIII. Historical memorandum relative to the constitution of the Army Medical Board - - -	421	1. Strength and deaths of non-commissioned officers and men on shore and afloat from 1839 to 1853 inclusive - - -	475
XIX. Memorandum on the establishment required for the office of the Army Medical Department - - -	421	2. Number of men discharged as unfit for service during the same period - - -	476
XX. Warrant regulating the Purveyor's Department - - -	422	LV. Table showing the strength of the Household Brigade, and of the Cavalry and Infantry of the Line serving in the United Kingdom, and the deaths in each year from 1st April 1839 to 31st March 1854 -	476

APPENDIX I.

(Paper given in by Dr. Smith.)

REGULATIONS for CANDIDATES for the APPOINTMENT of ASSISTANT-SURGEONS in the ARMY.

Recommended by _____
Christian and Surname at full length. { I _____ years of age in _____ last, a candidate for employment in the medical department of the army, do hereby attest my readiness to engage for general service, whether at home or abroad, and to proceed on duty immediately on being gazetted.

I declare that I am unmarried, and that I labour under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient discharge of the duties of a medical officer in any climate.

Signature _____

I have pursued the under-mentioned course of study, of which I am ready to produce the vouchers for registry, and also a certificate of my age, namely :—

I possess certificates of regular attendance at the under-mentioned hospitals and courses of lectures for the number of months stated :—

The _____ hospital or infirmary for _____ months.
The _____ hospital for mental derangement for _____ months.
The _____ hospital for diseases of the eye for _____ months.
The _____ Lying-in hospital for _____ months.

MEMORANDA.

1st. In selecting from among the candidates for the medical department of the army, a preference is given to those who can fill up all the blanks in the preceding pages, by having the acquirements therein stated. The name of no gentleman can be placed on the list who does not possess a diploma from the Royal College of Surgeons of England, Scotland, or Ireland, or from the Faculty of Physicians and

Surgeons of Glasgow, or other corporate body legally entitled to grant a diploma in surgery, and who cannot produce the following testimonials :—

- 18 months' attendance at an hospital of celebrity, where the average number of in-patients is not less than 100.
- 12 " anatomy.
- 12 " practical anatomy.
- 6 " physiology.
- 12 " surgery, (or, what is preferred) 6 months' surgery, and 6 months' military surgery.
- 8 " clinical surgery, a complete course of two or three lectures during the week.
- 12 " practice of physic, or 6 months' practice of physic, and 6 of general pathology.
- 8 " clinical lectures on ditto, the same as required in surgery.
- 12 " chemistry.
- 6 " practical chemistry.
- 3 " botany.
- 3 " materia medica.
- 3 " practical pharmacy or apprenticeship.
- 3 " natural history.
- 3 " midwifery.
- 3 " practical midwifery.
- 1 course natural philosophy.
- 1 course logic.

2nd. The candidate must be unmarried, not beyond 25 years of age, nor under 21 years,

3rd. Candidates who have had an University education, and have the degree of A.B. or A.M., as well as that of M.D., will be preferred ; but a liberal education, and a competent knowledge of the Greek and Latin languages, are indispensably requisite in every candidate.

4th. The greater the attainments of the candidates the more eligible will they subsequently be deemed for promotion, as selections to fill vacancies, especially in the higher ranks, will be guided more by reference to such acquirements, than to mere seniority.

5th. Although the British schools are specified, it is to be understood that candidates who have received a regular medical education in approved foreign Universities or schools will be admitted to examination.

6th. With the exception of practice of physic and clinical medicine by one teacher, candidates must have attended separate lecturers for each branch of medical science.

7th. Before promotion from the rank of assistant-surgeon to any higher rank, every gentleman must be prepared for such other examination as may be ordered before a board of medical officers.

8th. Diplomas, tickets of attendance on lectures, and certificates of regular attendance by each professor or lecturer, must be lodged at this office for examination and registry at least one week before the candidate appears for examination, likewise certificates of moral conduct and character, one of them by the parochial minister, if possible. Baptismal certificates are required at the same time, and if the parish register cannot be resorted to, an affidavit from one of the parents, or some near relative who can attest the fact, will be accepted.

9th. The certificate of the teacher of practical anatomy must state the number of subjects or parts dissected by the pupil.

10th. Certificates of lectures and attendance must be from physicians or surgeons of the recognized colleges or medical schools of the United Kingdom, or of foreign Universities.

11th. All candidates for medical appointments are required to be conversant with Cullen's Nosology.

Note.—All communications to be prepaid, or if not, to be forwarded, addressed *outside* to "The Right Honourable the Secretary at War," with the words "Army Medical Department" at the left-hand corner.—*This half sheet is not to be torn off.*

Army and Ordnance Medical Department,
February 1855.

APPENDIX II.

(Paper given in by Sir J. Liddell, C.B.)

Circular, No. 116.*

REGULATIONS for CANDIDATES for the OFFICE of
ASSISTANT-SURGEON in the ROYAL NAVY.

Admiralty, March 1st, 1853.

THE Right Honourable the Lords Commissioners of the Admiralty are pleased to direct, that the following regulations, relative to the examination of candidates for the appointment of assistant-surgeon in the Royal Navy, shall in future be adopted:—

That a candidate for entry into the Royal Navy shall make a written application to that effect, addressed to the Secretary of the Admiralty; on the receipt of which application he will be furnished with the regulations, and a printed form to be filled up by him, to show if he possess the required qualifications.

As vacancies occur, the number of candidates required will be ordered to attend at the Admiralty Office, bringing with them the requisite certificates, showing that they are fully qualified by age, professional ability, &c., when they will be examined by a Board of Medical Officers, to be named by their Lordships.

Such candidates as shall have been found in all respects competent for the appointment of assistant-surgeon, will be forthwith nominated to one of the naval hospitals at home, to await appointments to any of Her Majesty's ships; or should their services not be immediately required, their names will be duly registered for early appointments, as vacancies may occur.

That no person be admitted as an assistant-surgeon in the Royal Navy, who shall not produce a certificate from one of the Royal Colleges of Surgeons of England, Edinburgh, or Dublin, or from the Faculty of Physicians and Surgeons of Glasgow, of his fitness for that office; nor as a surgeon, unless he shall produce a diploma or certificate, from one of the said Royal Colleges or Faculty, founded on an examination to be passed subsequently to his appointment of assistant-surgeon, as to his fitness for the situation of surgeon in the navy; and in every case the candidate producing such certificate or diploma shall also undergo a further examination, touching his qualifications in all the necessary branches and points of medicine and surgery for each of the steps in the naval medical service; and that previously to the admission of assistant-surgeons into the navy, it will be required that they produce proof of having received a preliminary classical education, and that they possess in particular a competent knowledge of Latin; also,

That they are of good moral character, the certificate of which must be signed by the clergyman of the parish, or by a magistrate of the district.

That they have served an apprenticeship, or have been engaged for not less than six months in practical pharmacy.

That their age be not less than 20 years nor more than 26 years.

That they have actually attended an hospital in London, Edinburgh, Dublin, Glasgow, Aberdeen, Manchester, or Bristol, for eighteen months subsequently to the age of eighteen, in which hospital the average number of patients is not less than 100.

That they have been engaged in actual dissections of the human body twelve months; the certificate of which from the teacher must state the number of subjects or parts dissected by the candidate.

That they have attended lectures, &c. on the following subjects, at established schools of eminence, by physicians or surgeons of the recognized colleges of physicians and surgeons in the United Kingdom, for periods not less than hereafter stated; observing, however, that such lectures will not be admitted if the teacher shall lecture on more than one branch of science, or if the lectures on anatomy, surgery, and medicine, be not attended during three distinct winter sessions of six months each.

Anatomy { Or general anatomy, 12 months - } 18 months.
 { and comparative anatomy, 6 months - - - - } 6 "

Surgery -	{ Or general surgery, 12 months - and military surgery, 6 months - }	18 months.
Theory of medicine	{ If the lectures on the theory and practice of medicine be given in conjunction, then the period re- quired is 18 months - }	6 "
Practice of ditto*-	-	12 "
Clinical lectures (at an hospital as above)	{ On the practice of medicine - On the practice of surgery - }	6 " 6 "
Chemistry	{ Or lectures on chemistry, 3 months and practical chemistry, 3 months }	6 "
Materia medica	-	6 "
Midwifery	{ Accompanied by certificates stating the number of midwifery cases personally attended - }	6 "
Botany	-	3 "

* Six months' lectures on pathology, if given at a University where there may be a professorship on that branch of science, will be admitted in lieu of six months' lectures on the practice of medicine.

In addition to the tickets for the lectures, certificates must be produced from the professors, &c. by whom the lectures were given, stating the periods (in months) *actually* attended by the candidates. The time also of actual attendance at an hospital or infirmary must be certified; and the tickets as well as certificates of attendance, age, moral character, &c., must be produced by the candidate previously to his examination.

Although the above are the only qualifications which are absolutely required in candidates for the appointment of assistant-surgeon, a favourable consideration will be given to the cases of those who have obtained the degree of M.D., at either of the Universities of Oxford, Cambridge, Edinburgh, Dublin, Glasgow, London, or Aberdeen; or who by possessing a knowledge of diseases of the eye, and of any branch of science connected with the profession, such as medical jurisprudence, natural history, natural philosophy, &c. appear to be more peculiarly eligible for admission into the service, observing, however, that lectures on these or any other subjects cannot be admitted as compensating for any deficiency in those required by the regulations.

By the rules of the service, no assistant-surgeon can be promoted to the rank of surgeon until he shall have served three years (one year of which must be in a ship actually employed at sea), and can produce a diploma from one of the before-mentioned Royal Colleges or the Faculty of Physicians and Surgeons, and it is resolved that not any diploma or certificate of examination from either of the aforesaid Royal Colleges shall be admitted towards the qualification for surgeon, unless the diploma or certificate shall be obtained on an examination passed after a period of not less than three years' actual service; observing, that no one can be admitted to an examination for surgeon unless, as herein-before mentioned, he can produce a diploma, together with the most satisfactory certificates, that he has performed, on the dead body, under the superintendence of a professor or teacher of known eminence, all the capital operations of surgery, and is perfectly competent to perform any operation with skill and dexterity, and thoroughly acquainted with the anatomy of the parts involved in such operation; without which qualification, no one hereafter can be promoted to the higher branches of the service; and whenever assistant-surgeons already in the service whose professional education may not be in accordance with the above) obtain leave to study previously to their passing for surgeon, they will be required, on their examination, to produce testimonials of their having availed themselves of the period of leave to complete their education agreeably to these regulations generally.

It is also to be observed, that candidates who may be admitted into the naval medical service, must serve in whatever ships, &c., they may be appointed to; and that in the event of their being unable to do so from sea sickness, their names cannot be continued on the naval medical list, nor can they, of course, be allowed half-pay.

By command of their Lordships,
R. OSBORNE.

APPENDIX III.

(Furnished by the India Board.)

REGULATIONS for the ADMISSION of CANDIDATES for the Appointment of ASSISTANT-SURGEON in the Service of the EAST INDIA COMPANY.

ALL natural-born subjects of Her Majesty between 22 and 28 years of age, and of sound bodily health, may be candidates for admission into the service of the East India Company as assistant-surgeons.

They must subscribe and send in to Dr. Scott, the physician to the Honourable East India Company, 10 days before the period fixed for each examination, a declaration to the following effect:—

“I (christian and surname at full length), a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was _____ years of age on the _____ day of _____ last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment.”

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration, pursuant to the Act 5 & 6 William IV. cap. 62.

2. A certificate of moral character from a magistrate, or a minister of the religious denomination to which the candidate belongs, who has personally known him for at least two preceding years.

3. A diploma in surgery; or a degree in medicine, provided an examination in surgery be required for such degree; from some body competent by law to grant or confer such diploma or degree.

4. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended, for six months, the practice and clinical instruction of the physicians at some hospital containing at least, on an average, one hundred in-patients; or of having attended one course of lectures, of six months, on the practice of physic, and clinical instruction for twelve months.

5. A certificate of having attended, for three months, the practical instruction given at one of the public asylums for the treatment of the insane.

6. A certificate of having attended, for three months, one of the institutions, or wards of an hospital especially devoted to the treatment of ophthalmic disease.

Candidates who may not have been able to attend the practice of an asylum for the insane, or of an ophthalmic hospital, for three months previous to their offering themselves for examination, will not be excluded from examination, but will, if successful in obtaining recommendation for appointments, be required to produce certificates of having attended such practice during the interval between the examination and the time of proceeding to India.

7. A certificate of having attended a course of lectures on midwifery; and of having conducted at least six labours.

8. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any course of lectures, in addition to the above. Attendance on a course of military surgery, and the practical study of surgical operations on the dead body, are recommended. The examination will include the following subjects:—

1. Surgery in all its departments.

2. Medicine, including the diseases of women and children, Therapeutics, Pharmacy, and Hygiene.

3. Anatomy and Physiology, including Comparative Anatomy.

4. Natural History, including Botany and Zoology.

The following are the books recommended in—

Zoology and Comparative Anatomy—

Outlines of the Structure of the Animal Kingdom, by Rymer Jones.

Cours Élémentaire d'Histoire Naturelle, par Milne Edwards.

Botany—

Lindley's School Botany.

Lindley's Elements of Botany.

The examination will be conducted—

1. By means of written questions and answers.

2. By object examinations and experiments, when the subject admits of such tests.

3. By practical examination of patients, and by operations on the dead body.

4. By *vivâ voce* examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, will be appointed to fill the requisite number of appointments as assistant-surgeons in the East India Company's service, and so far as the requirements of the service will permit, they will have the choice of the presidency in India to which they shall be appointed, according to the order of merit in which they stand on the list resulting from such examination.

All assistant-surgeons are required to subscribe to the military or medical, and medical retiring funds, at the presidencies to which they may be respectively appointed, and to the military orphan society also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointment, will be considered as having forfeited it, unless special circumstances shall justify a departure from this regulation. A copy of these regulations, and any further information, may be obtained on application to the Secretary of the Military Department, East India House.

The examinations will take place in the months of January and July in each year, and due notice will be given by public advertisement of the days appointed, and of the probable number of candidates to be selected.

APPENDIX IV.

(Given in by Sir J. Liddell with reference to Question 226.)

CERTIFICATE required of NAVAL ASSISTANT-SURGEONS before PROMOTION.

Capital Operations of Surgery on the Dead Body.

THIS is to certify, that _____ has, under my personal superintendence, made a dissection of the surgical regions of the body, and performed all the capital operations of surgery thereon;—that he is perfectly competent to perform any operation with skill and dexterity; and that he is thoroughly acquainted with the anatomy of the parts involved in such operations.

Given under my hand, this _____ day of _____

*

* Professor, or Teacher, as the case may be.

Right to Retire.

Every medical officer who may have served upon full pay for 25 years and upwards, shall have a right to retire on half pay, and may be recommended for the higher rate, provided he shall have served 3 years in the rank from which he retires; but if he shall not have served 3 years in such rank, he shall receive only the rate attached to the rank from which he was last promoted.

If a medical officer shall have served 30 years on full pay, including three in the rank from which he retires, or, not having served such three years, shall have served ten in the colonies, or five with an army in the field in any rank, he may be allowed the higher rate of half pay.

July 1857.

A. SMITH,
Director General,
Army Med. Dep.

APPENDIX VIII.

(Furnished by Dr. A. Smith.)

29 ditto	365 "
32 ditto	500 "
35 ditto	700 "

The full time of service must be completed in each case, but leaves of absence in India or Europe or elsewhere are allowed to count as service to the extent of—

1 year and 8 months in 17 years' service.	
2 years - - in 20	"
3 years - - in 25	"
4 years - - in 30	"

East India House,
1st July 1857.

APPENDIX XIII.

(Given in by Dr. Balfour.)

MEMORANDUM relative to the PAY of ARMY MEDICAL OFFICERS.

In 1557 the pay of the army surgeon was 1s. per diem, and one was attached to each company, which usually consisted of 100 to 120 men.

In 1620 a surgeon-major to the camp was appointed, with a pay of 5s. per diem, and he had two "mates" under him, who each received 4s. a day. In addition to the company surgeons already noticed, who at this period were paid, in cavalry regiments, 2s. 6d., and in infantry, 1s. per diem, each regiment, then about 2,000 strong, had a head surgeon, whose pay was 4s. a day.

In 1655 the company surgeons were abolished, and a mate was appointed to each infantry regiment at the daily pay of 2s. 6d. At the same time 2s. a day in addition to his pay was granted to the cavalry surgeon to enable him to keep his horse.

In 1759 the pay of the surgeon's mate was raised to 3s. 6d.

In 1796 the rank was replaced in regiments by that of assistant-surgeon, with a daily pay of 5s. in time of peace, and 7s. 6d. during war; but hospital mates continued to be appointed to the staff till 1813, their pay being increased in 1804 to 6s. 6d. at home, and 7s. 6d. abroad.

Prior to 1783, each officer and soldier paid to the surgeon of the regiment a small sum annually, under

the title of "medicine money," with which to purchase the medicines he required. In ordinary seasons the surgeon saved from 50l. to 70l. out of this fund, which increased his pay to about 8s. per diem. In 1783 government abolished this stoppage from the soldiers' pay, and granted an allowance to each regiment, varying in amount from 70l. to 120l. per annum. In 1797 this was discontinued, and to compensate him for the loss, the surgeon's pay was fixed at 11s. 4d. in cavalry, and 9s. 4d. in infantry.

In 1804 the Department was remodelled, and established by Royal Warrant as follows :—

Ranks.	Daily Pay.	Daily Half-pay.	
	£ s. d.	£ s. d.	
Hospital mate, at home -	0 6 6	} 0 2 0	The additional 1s. to the cav- alry officer to cover ex- pense of keeping a horse.
" " abroad	0 7 6		
Assistant-surgeon, ca- valry.	0 8 6	} 0 3 0	
Assistant-surgeon, in- fantry.	0 7 6		
Apothecary, and sur- geon of recruiting district.	0 10 0	0 5 0	
Regimental surgeon -	0 11 4	0 6 0	

Ranks.	Daily Pay.	Daily Half Pay.	
	£ s. d.	£ s. d.	
Regimental surgeon, after 7 years' service as surgeon, or 10 in the army.	0 14 1	0 6 0	
Regimental surgeon, after 20 years in the army.	0 18 10	0 6 0	
Regimental surgeon, if obliged to retire from bad health after 20 years.	"	0 10 0	
Regimental surgeon, after 30 years' service.	"	0 15 0	Entitled to retire even if in good health.
Surgeon to the forces	0 15 0	0 6 0	After 20 and 30 years' service
Physician to the forces	1 0 0	0 10 0	surgeons to the forces had the same increased rate of pay as regimental surgeons.
Deputy inspector-general of hospitals.	1 5 0	0 12 6	
Deputy inspector-general of hospitals, after 20 years' service.	1 10 0	0 15 0	
Inspector-general of hospitals.	2 0 0	1 0 0	
Principal inspector	2 0 0	0 0 0	Members of the Medical Board.
Surgeon-general	2 0 0	0 0 0	
Physician-general	2 0 0	0 0 0	

In 1813 hospital mates were abolished, being replaced by hospital assistants, who received the same rates of pay, but were commissioned by the King instead of being appointed by Warrant. In 1830 these were made assistant-surgeons to the forces, the rank of apothecary to the forces was prospectively abolished, and that of assistant-inspector of hospitals replaced the physicians to the forces. An increase of pay, after certain periods of service, was also granted, which fixed the rates, with a few exceptions, at their present amounts.

In 1840 the grade of assistant-inspector of hospitals was discontinued, and the pay and allowances of staff surgeons increased to the amount of the abolished rank. The grade of staff surgeons of the second class, with the same rank and pay as regimental surgeons, was established. These changes were made in terms of the recommendation of a Royal Commission.

The Royal Warrants of 1st and 14th October 1840, confirmed by that of 6th October 1854, established the present rates of pay and half-pay, as follows:—

RANKS.	Rates of half-pay if placed thereon owing to			Before being eligible for promotion must have served
	Rates of Daily Pay.	Reduction of the Establishment.	Any other Cause.	
	£ s. d.	£ s. d.	£ s. d.

Half-pay	5 0	6 0	7 0	8 0	9 0

APPENDIX XIV.

(Given in by Mr. Martin.)

COPIES of CORRESPONDENCE from the GOVERNING BODIES of the UNIVERSITIES and ROYAL COLLEGES of PHYSICIANS and SURGEONS of England, Ireland, and Scotland, relative to the Insufficiency of the present Position, Pay, and Retirement of the Medical Officers of the Army, as communicated to the Right Honourable the Secretary of State for War, in Memorials from the above-mentioned Bodies.

Royal College of Surgeons of England.

At a quarterly meeting of the council of the Royal College of Surgeons of England, on the 8th of April 1857,

The council having taken into further consideration the memorial from certain medical officers of the army on the subject of their position and pecuniary advantages, laid before the council at their last meeting; and having also taken into consideration Mr. Tufnell's letter of the 19th ultimo,—

Resolved—That without presuming to doubt the justness of the decision which the commission ap-

pointed to consider such claims may come to, this council deem it their imperative duty to request the attention of the Right Hon. the Secretary for War to the claims of the medical officers of the army to a position and remuneration more commensurate with their position as men of scientific acquirements, and the importance of their services to the country.

And this council are induced to urge such claims upon the favourable consideration of Her Majesty's Government, not alone as due to the members of this and the other medical colleges of the United Kingdom, but also as the only means of obtaining for the

medical department of the army the services of those best qualified to render that prompt and efficient aid which the exigencies of the service so constantly require.

(Signed) EDMD. BELFOUR, Secretary.

To the Right Hon. Lord Panmure,
Secretary of State for War.

Royal College of Surgeons of Edinburgh.

Unto the Right Honourable the Secretary of State
for War.

The memorial of the Royal College of Surgeons of
Edinburgh,

Sheweth,

That it is of the utmost importance to maintain the medical department of the army in a high state of efficiency.

That your memorialists have long entertained the conviction that the position of medical officers in the army is not such as their professional claims entitle them to; and that their pay and other pecuniary advantages, during service and upon retirement, form an inadequate remuneration for the important duties which they are called upon to discharge to the public.

That such being the case, the Army Medical Department does not, in point of fact, offer sufficient inducements to the most highly-educated and talented young members of the profession, but, on the contrary, that its regulations are such as positively to deter such persons from entering it.

That in order to place this most valuable branch of the service upon a proper footing, your memorialists are of opinion that it is most desirable to raise the position of medical officers in the army, by assigning to them, after a short period of service, a higher regimental rank than they have hitherto enjoyed, along with corresponding advantages as regards choice of quarters, and in other respects; to make a considerable increase to their allowances; and also to make provision for their being allowed to retire from the service after a fixed period, upon full pay.

That your memorialists respectfully but earnestly recommend the subject to the serious consideration of Her Majesty's Government, in the hope that they will see it right to recognize what appear to your memorialists to be the just claims of a most meritorious class of her Majesty's servants.

In name, &c.

JOHN SCOTT, Secretary,
R.C.S., Edin.

Royal College of Surgeons of Dublin.

Extract from the minutes of a Meeting of Council,
held on the 30th January 1857.

Resolved—That the council of this college, being aware that the question of amelioration of the Army Medical Department is now before the Government, and having had the subject of the pay and position of the army surgeons brought before them, and having given to that subject their fullest consideration, they beg leave to express it as their decided opinion, that they regard the position of the medical officers of the army as incommensurate with their professional claims.

And this council consider further that the pay and emoluments of these officers, during service and on retirement, are beneath those which they are justly entitled to receive, considering their high professional qualifications, and the duties which they discharge to the public.

And that this resolution be transmitted to the Secretary of State for War.

Royal College of Physicians, Edinburgh.

Resolutions adopted by the Royal College of Physicians of Edinburgh, at the meeting of the college, held at Edinburgh on 3d February 1857.

First.—That it is desirable and important that such inducements should be held out in connection with the medical department of the army, as would attract men of talent and acquirements to adopt this department of the public service for their professional life.

Second.—That with this view, considering the high standard of education required, the anxious responsibilities involved, and the risks of climate, pestilence, and war to which they are exposed, the present pay of surgeons and assistant-surgeons is altogether inadequate, and less than that which may be obtained by practising as medical men, even in comparative obscurity.

Third.—That the efficiency of this branch of the service will be promoted by a higher rate of pay from the first; by a regular increase in emoluments, and improvements in status, regulated by length of service and special duties; and by arrangements as to terms of service and retiring allowances, such as might encourage men of promise and high education to enter the service and to continue in it.

Fourth.—That considering the valuable services which, by universal acknowledgment, were rendered by the medical officers during the late campaign, their self-sacrifice, moral courage, and devotion to their arduous duties, under trying circumstances, the present seems a suitable opportunity for the recognition of the claims of this important branch of the service to higher status and emoluments.

Fifth.—That these resolutions be communicated to the Right Honourable Lord Panmure, Secretary-at-War, with a respectful but earnest recommendation that the subject to which they refer may receive his Lordship's favourable consideration.

Excerpted from the minutes of the Royal College of Physicians in Edinburgh.

CHR. DOUGLAS, Clerk.

King and Queen's College of Physicians, Dublin.

At a meeting of the King and Queen's College of Physicians in Ireland, held on Friday, January 30, 1857,

The president and fellows, having had under their consideration the case of the medical officers of the army, it was

Resolved—That the college are of opinion, that the position, amount of pay, and conditions for retirement of the medical officers of the army, offer inadequate remuneration for the responsible nature of the duties they are required to discharge, and insufficient return for the labour and expense entailed upon them, as students, in acquiring a thorough knowledge of the profession.

Resolved—That considering the many advantageous appointments now open, by competitive examination, to students in other departments of the public service, the college are also of opinion that the position, pay, and conditions for retirement of the army medical officers are insufficient to induce the most highly qualified students to seek admission for the future into Her Majesty's service.

Resolved—That for the reasons stated in the foregoing resolutions, the college are of opinion that the relative rank of the medical officers of the army should be raised; their pay increased; that a reasonable period of service should entitle them to retirement upon full pay; that it should be open to them to receive military honours for distinguished service; and that they should be entitled to all advantages enjoyed by other officers of corresponding rank in Her Majesty's service.

W. EDW. STEELE, Registrar.

University of Dublin.

The professors have considered "the memorial" on the part of the medical officers of the army; also some portions of "the evidence" adduced in its support, furnished by those persons whose rank and experience render them most competent to form a correct judgment on the subject.

There can be no doubt that the "medical" forms a very important branch of the military service, and that the duties of the surgeon and assistant are of an arduous nature, both at home and abroad; and that it is of the utmost importance to the public, that these duties should be ably and efficiently performed in times of *peace* as well as of *war*.

The education of the medical officer ought therefore to be of a very high order, and, of necessity, protracted and expensive.

The existing regulations of the service do not appear to the professors to hold out sufficient encouragement, either by present or prospective remuneration and rank, to induce students of the highest order, as to education and attainments, to seek for those appointments; and the professors are aware, that of late years many of that class of students have preferred the service of the E. I. Company, notwithstanding the searching competitive examination, merely because the conditions of that service, as to pay and superannuation, are on a more liberal scale than in Her Majesty's forces.

The professors fully concur in the prayer of "the memorial," and are of opinion that, in order to secure to the public a constant succession of a highly educated class of medical officers, their remuneration ought to be increased, their relative rank in the army improved, their retirement permitted at an earlier period, and their retiring allowance augmented.

The professors are also of opinion, that should these views be adopted, not only would the position of the medical officers be substantially improved, but also the public service benefited and medical science advanced, and that a higher and better educated class of candidates would anxiously seek for those appointments, and be found prepared to stand competitive examinations, in the event of "the Director-General" instituting these as a necessary test of qualification for entering the service.

JAMES APJOHN, Prof. Chemistry.
ROBERT W. SMITH.
WILLIAM STOKES, Reg. Prof.
J. W. CUSACK, Prof. Surgery.
W. H. HARVEY, Prof. Botany.

University of Edinburgh.

Unto the Right Honourable the Secretary of State for War.

The Memorial of the Senatus Academicus of the University of Edinburgh,

Humbly sheweth—

That the efficiency of the medical department of the army is a matter of high national importance.

That the present position of the medical officers of the army is not commensurate with their professional claims; and their pay and other allowances during service and upon retirement, do not give adequate remuneration for the responsible public duties which they are called on to perform.

That on these accounts the medical department of the army does not offer sufficient inducements to secure the services of the most able and highly educated of the junior members of the profession.

That with a view of placing this important department of the service on a more satisfactory footing, the memorialists are fully persuaded that it is desirable to raise the status of the medical officers of the army, by giving them a higher regimental rank after a limited period of service, by conferring advantages in such

matters as the choice of quarters, by increasing their allowances, and by permitting them to retire, after a fixed period, on full pay.

That the memorialists respectfully but earnestly venture to bring this subject under the serious consideration of Her Majesty's Government, in the hope that measures will be immediately taken for remedying the existing discouragements and grievances, and for doing ample justice to the claims of a most deserving class of Her Majesty's servants.

And the memorialists will ever pray.

Signed in name and by the authority of the Senatus Academicus of the University of Edinburgh, this 4th day of February 1857.

(Signed) JOHN LEE, D.D., Principal.

University of Glasgow.

At a meeting of the University of Glasgow, held on Monday, March 9th, *inter alia*,

Dr. Easton reported that the medical faculty had taken into consideration the petition from medical officers in the army, referred to them by the Senate at last meeting, and are of opinion that the allegations in said petition were well founded.

Thereupon the Senate, having considered the petition and report, agreed to express it as their opinion, that the present pay, position, and retiring allowance of the medical officers of the army are insufficient, and unlikely to secure for the country, in future, the services of the best men; and instructed their clerk to communicate this expression of their opinion to the petitioners.

Extracted from the minutes of Senate by
DUNCAN H. WEIR, M.A.,
Clerk of Senate.

Faculty of Physicians and Surgeons, Glasgow.

To the Right Hon. Lord Panmure, Secretary-of-War.
MY LORD,—

The faculty of physicians and surgeons of Glasgow having received a memorial from a large body of medical officers of the army, requesting the faculty in their corporate capacity, and as guardians of the interests of their licentiates, to express to Her Majesty's Government, through your lordship, their deliberate opinion whether the position of said memorialists, in reference to status, pay, and retirement, is sufficient and likely to secure and retain the services of the best men; and the faculty having taken the said memorial into consideration, and for reasons founded on the nature and value of the services of the memorialists, are of opinion that the position of the medical officers of the army, in reference to status, pay, and retirement, is unsatisfactory, and ought to be improved. And while the faculty would most respectfully urge upon the government, through your lordship, the propriety of raising the status of the army surgeons, they also deem it essential to the full and permanent efficiency of the medical department of the service, that the path to honours be made at least equally accessible to the medical as to the military officer.

I have, &c.
(Signed) ROBERT HUNTER,
President.

Marischal College, Aberdeen.

The Memorial of the Principal and Professors of Marischal College and University of Aberdeen to the Right Honourable the Lord Panmure, G.C.B., Secretary of State for War, &c., &c.

Humbly sheweth—

That the memorialists consider the present remuneration and prospects of army medical officers

are insufficient for the valuable services rendered to the state by that class of public servants, and not calculated to induce the best class of alumni to seek for employment in the medical department of the army. The memorialists therefore respectfully appeal to your lordship to be pleased to adopt such measures as to your lordship may seem most calculated to procure for army medical officers,—

1st. Increased rank and pay to surgeons and assistant-surgeons ;

2nd. The right of earlier retirement ; and,

3rd. Increased retiring allowance to all grades.

And your memorialists, as in duty bound, will ever pray, &c., &c.

(Signed) D. DEWAR,
Principal.

King's College, Aberdeen.

*King's College, Aberdeen,
3rd March 1857.*

SIR,—

I regret to say that the copy which was retained of the memorial of the senators of the University to the Minister of War, on behalf of the medical officers of the army, has unfortunately been mislaid. I will, however, forward it to you if it should be found.

In the meantime it may be sufficient to state, that adverting to the fact that a number of efficient and distinguished medical officers have received their preliminary as well as professional education at this institution, as a peculiar reason for the interest felt by us in the subject, we strongly urge the adoption of the suggestions of the parliamentary committee, and the immediate improvement of the condition of the medical officers, as regards pay, position, and retirement.

Yours very faithfully,
P. C. CAMPBELL.

APPENDIX XV.

PAPER relative to the GROUPING of STATIONS for the Purpose of Promotion.

(Given in by Dr. Smith.)

When a regimental surgeon or staff surgeon of the second class died in either of the following commands, viz., the United Kingdom, Jamaica, Windward and Leeward Islands, Ceylon, Hongkong, or India, the senior assistant-surgeon in the command was, except under special circumstances, considered entitled, if in good health, to promotion ; and a like practice was observed in the following groups of commands, viz., Mediterranean group, consisting of Gibraltar, Malta, and the Ionian Islands—American group, consisting of Canada, Nova Scotia, and Bermuda—Cape of Good Hope group, consisting of Cape of Good Hope and the Mauritius—and the Australian group, consisting of New Zealand, New South Wales, and Van Diemen's Land.

If death vacancies are to be filled up, as formerly by the promotion of the senior assistant-surgeon in a command, or a group of commands, such may be done either by observing the existing plan or by instituting two large groups—the one to consist of the Cape of Good Hope and all the stations eastward of it ; the other, all to the westward of the Cape.

If these two divisions be adopted, the assistant-surgeons serving in India, Hongkong, and Ceylon, will doubtless consider themselves unfairly treated, as they generally suffer more from disease than those who serve in the other commands of the district.

APPENDIX XVI.

(Prepared by the Secretary.)

1. NOMINAL RETURN of the REGIMENTAL and SECOND-CLASS STAFF SURGEONS on Full Pay on 1st July 1857, having less than Ten Years' Full Pay Service (exclusive of Household Brigade).

APPENDIX XVII.

(Furnished by the India Board.)

MINUTE by the Most Noble the GOVERNOR-GENERAL, concurred in by His Excellency General the Honourable G. ANSON, Commander-in-Chief.

The Indian Medical Service. (s^d) D.

1. There still remain departments in the several branches of administration, which I should have been glad to have had time to revise and amend before resigning the government of India. But the constant pressure of business requiring immediate attention has rendered it impossible for me to find time for everything; and the near approach of the day of my departure almost forbids any further attempts to propose reforms. There is, however, one department which calls for improvement so loudly, which calls for it so justly, which is so easily susceptible of full improvement, which is so worthy of it, and will so promptly and amply repay it, that I cannot be content to leave India without submitting my views regarding that portion of the service to the Honourable Court,

and earnestly soliciting their favourable consideration of what I shall propose. I allude to the medical department of the three presidencies.

2. It is impossible for me now to work out the subject in its lesser details; indeed, it is inexpedient that I should attempt to do so. It is far preferable that those details should be left to the management of the government hereafter, if the Honourable Court should be pleased to approve of the general outline of what I am about to propose. It is that general outline only which I now desire to submit.

3. The Indian medical service has been the subject of inquiry, discussion, and representation for many years past. The Honourable Court have full information at their command regarding its condition, its deficiencies, and all the various means of improving

the one and repairing the other. The records of inquiries held in this country by direction of the Government of India, the evidence which has been given before committees of Parliament, and the numerous memorials which have from time to time been presented to the Honourable Court by members of the medical service of name and note in the several presidencies, all furnish a body of important facts which cannot be controverted, and have never even been disputed.

It is therefore unnecessary for me to burden this minute by setting forth in it facts which are already so fully on record, and which will at once be present to the memory of the Honourable Court, and familiar to it on my referring to them.

4. The first great fault in the organization of the Indian medical service, the beginning, middle, and end of its imperfections, is the vicious principle on which the direction and control of the department is based. It is governed by a board consisting of three members, those three members having been systematically the three oldest officers on the medical list. Recently the Honourable Court permitted a modification of this system of rigid seniority to be made, so far as to allow that one of the three members should be appointed by selection. When I proceeded to act on this permission I met with the utmost opposition, and although I selected a medical officer of the most eminent ability, of distinguished service, and, moreover, among the three seniors of the superintending surgeons, I was compelled to insist upon his appointment before I could overcome the resistance which, by repeated remonstrance and representation on behalf of the two seniors, was made to the measure from army head-quarters.

5. When the medical service has been for so long subjected to the government of a board, when that board has been uninterruptedly filled by a rigid system of seniority, and when that system of seniority has been thus inflexibly sustained by the military authorities and countenanced by the government, the Honourable Court can have no doubt of the ill effects which must have ensued.

6. I say that the Honourable Court can have no doubt of the ill effects which must have ensued from such an organization, because the Honourable Court have already recognized the viciousness of the principle on which it is based, in the case of another controlling authority of a similar constitution, viz., the Military Board. That board was not in its constitution so radically bad as the Medical Board, because it had not been filled like the latter in all its grades by absolute seniority. But it was largely subject to objections of the same character. The Honourable Court acknowledged the inherent faultiness of its constitution. They even outstripped me in proposals for reserving different departments from its influence, which I had made gradually and cautiously, in order that alarm might not be created by any appearance of wholesale innovation. Finally, the Honourable Court readily consented last year to the total abolition of the Military Board.

7. I strongly recommend, and earnestly hope, that the Honourable Court will in like manner consent to the total abolition of the Medical Board.

8. The one true, right, sound principle for the government of the medical service in India, is that which the Court have permitted the government of India to act upon, in providing a substitute for the collective control of the Military Board, namely, unity of authority coupled with direct responsibility.

9. Let this principle be strictly observed in framing the direction of the department, let the principle which is to govern all other appointments in it be, not succession but selection; let the responsibility of causing effect to be given to these two principles, be placed not indirectly, as it is at present, but directly upon the shoulders of the government; and I will answer for it, that the medical service of the East India Company will be surpassed by none in the world, either in its civil or military branch.

10. Already in many respects the India medical service is superior to the Royal service, especially in the organization of the inferior grades. There have already been found in its ranks many men of the highest capacity and value, who elsewhere would have won an European reputation; but if the directing authority of the department were what it ought to be, the number of those who do it honour would be still more increased, while it would become the fault of the Government itself if those who are a reproach to the department should continue to discredit it.

11. I therefore advise that the Medical Board at the several Presidencies should be abolished, and that in each Presidency the entire direction and control of the Medical Department, subject to the authority of the Government, should be vested in a Director-General.

12. I recommend that the Director-General should be selected by the Government from among the superintendent-surgeons or staff-surgeons, who will be mentioned hereafter; that his tour of duty should be for five years, renewable by the Government if it should think proper, and that his salary should be 3,500 rupees per mensem.

The Director-General should perform all the duties which the Medical Board is now expected to perform, and he should have the services of a secretary.

13. The extent of the Bengal Presidency is now so great, the new provinces subsidiary to it are so numerous, and still increasing, and the civil and military establishments connected with it are so immense, that the Director-General would be unable to perform the onerous functions of his office unless he had either a very large and costly establishment, or assistance of a high class, immediately subordinate to his office.

As the more effective measure, and also in order that the opportunities of advancement and reward for medical officers, which are already much curtailed, should not be unduly diminished, I would advise that two officers be appointed under the Director-General, one to be the Inspector-General of military hospitals, and the other to be the Inspector-General of civil hospitals and dispensaries.

The names of these officers indicate their respective duties. Their salary should be 2,500 rupees, two thousand five hundred per mensem. They should each have an assistant or secretary. They should be liable to be deputed on special duty by the Director-General, and his place should be taken by one of them if he should be temporarily absent.

14. The superintending surgeons should correspond with the Inspector-General, and they with the Director-General, but all ultimate decision and responsibility within the department will rest with the Director-General. Present members of the Medical Board who may not be employed as Director-General or as Inspector-General, should be allowed to retire, retaining their allowances for as long as their tour in the Board would have lasted.

15. The next grade in the department should be, as at present, the superintending surgeon.

The office is an efficient part of the system, if it be filled by efficient men. But the promotion to it, as to the Medical Board, has been hitherto regulated by the recommendations of the Commander-in-Chief, proceeding invariably and exclusively on strict seniority.

It is manifestly impossible that the twelve senior officers on the medical list next after the members of the Board can be the twelve fittest men for the performance of the important and responsible duty of superintending the whole executive of the department. It is notorious that although some are, the superintending surgeons as a body are not the fittest men to superintend others, and thereby at once to protect the interests of the Government, and to promote the welfare of the community—yet they ought to be so.

The only means by which the Honourable Court can insure that they shall be so, is by directing that the appointment to the office of superintending surgeon

shall in all cases be by selection of the fittest man for each vacancy that may occur.

I beg to recommend that the Honourable Court should issue such instructions accordingly.

16. The substitution of the twelve best men in the medical service for the twelve oldest men, next after the Director and Inspector General, as superintending surgeons, will have a great and wholesome effect. But it will still leave a deficiency to be supplied.

The superintending surgeon cannot, unassisted, perform fully the duties that belong to his office, even if he be thoroughly efficient. The proper discharge of those duties, which require his almost constant presence at divisional head-quarters, is incompatible with those frequent inspections of all his stations, in which consists the very essence of superintendence.

17. The consequence now is, that in most circles the duty cannot be said to be done at all; where it is done, the duty left at head-quarters is naturally neglected by the senior officer into whose hands it falls, and who gets neither credit nor advancement nor emolument by it.

18. The consequence hereafter will be, when efficient superintending surgeons shall be appointed, that the duty generally will be vastly better done, but it must still be imperfectly done either at head-quarters or in the mofussil.

19. To remedy this deficiency, I beg to advise that a new grade of medical officers should be created, who should be called "staff surgeons." In number there should be one for each circle in which there is a superintending surgeon, and one for general duties at the presidency.

Their salary should be 1,000 rupees, one thousand a month; they should be appointed by selection from among officers of the rank of surgeons. They should do the duties of superintending surgeon if that officer leaves head-quarters; they should do his duties in the mofussil if he should depute them for that purpose.

20. The addition of one "staff assistant-surgeon" for each staff surgeon would render the system complete. But at present I urge only the appointment of staff surgeons.

21. By this means the function of superintendent would be properly performed, which it has never yet been; all duties would be carried on in each circle without arrears or irregularities; great economy, as well as greatly increased efficiency, would be the certain result in time of peace; and in time of war, the Government would have ten or twelve of their best men ready to their hand for employment in the field, without stripping regiments or establishments, and without most seriously deranging the whole working of the department throughout the presidency, as is now the case in any sudden call.

22. Moreover, a great boon and most desirable encouragement would be given to the large body of full surgeons, who have now very many years to wait, after their promotion, without any increase of allowances, which they can only obtain by reaching, step by step, the grade of superintending surgeon; while, even under the system of selection to that grade, which has now been recommended, the existence of an intermediate step would greatly quicken professional zeal and ambition, and by its cheering effect would repay the Government a hundred-fold for the inconsiderable extra expense which the measure would involve.

23. The initiation of the nomination to all the principal appointments in the medical service has, hitherto, rested with the Commander-in-Chief; the real power of appointment being in the Governor-General in council, whose confirmation was necessary to His Excellency's nomination.

I recommend that this apparently divided responsibility should be set aside; and that the appointment of the high medical officers should rest directly, as it hitherto has practically, with the Governor-General in council.

The medical service is not exclusively military in its composition, although all its members hold mili-

tary commissions. On the contrary, the civil appointments, of all kinds, are much more numerous than the military.

All military appointments should be made by the Commander-in-Chief; all civil appointments by the Governor-General in council, the Governors in council, and the Lieutenant-Governors.

The Director-General should be appointed by the Governor-General in council, the inspectors-general, superintending surgeons, and staff surgeons, by the Governor-General in council.

But in every appointment, whether by the Governor-General in council, the Governor in council, and the Lieutenant-Governor, or by the Commander-in-chief, *the Director-General should recommend*; and, although it would not be expedient that the nomination of the Director-General should be declared to be binding and final (because some appointments are personal, and, in the foreign department, medical officers from other presidencies might be desired), still his recommendation should never be set aside, except upon very strong grounds, which should be placed upon record.

24. No doubt this measure would limit the patronage of all the high functionaries I have named. But it is very fitting that their patronage should be so limited in regard to medical officers of whose qualities and professional capacities it is not possible for them to form a correct judgment.

25. The principle of the measure, however, is no novelty, for the power which I propose to give to the Director-General in India has always been exercised by the Director-General in the Royal service.

26. By adopting these measures the mistakes which we all occasionally commit, however unconsciously, in the administration of patronage, will be avoided. The right men will be chosen. The profession will get fair play. The rise of an officer of merit will no longer be doubtful, and the service will recover the popularity it formerly had among men devoting themselves in youth to the medical profession.

27. The assistant-surgeons of the company's service are sufficiently well paid on their first entrance into it. But many years elapse before they are promoted to the rank of surgeon, and intermediately there is no increase of emoluments for the main body of the assistant-surgeons, or for any but those who obtain detached employment.

A great stimulus to exertion would be given, and great benefit would result, if the Honourable Court would consent to allow to the assistant-surgeons, as such, some increase of emoluments on certain just conditions.

28. At present an assistant-surgeon who is in charge of a regiment receives only half the staff salary which is drawn by a surgeon holding a similar charge.—I would propose that any assistant-surgeon in charge of a regiment who after seven years' service shall be recommended by the Director-General as in every respect deserving of reward, should receive the same staff salary as would be drawn by a surgeon in the same position.

29. The assistant-surgeons might thus be divided into first and second class assistant-surgeons.

30. It certainly seems that something is required to restore the attractions which the medical service of the Honourable Company possessed in former years, but which general testimony and obvious facts unite to show it has now lost.

I remember that when twenty years ago I asked for a medical appointment from one of the directors, I was told that it was as difficult to obtain an appointment in the medical service as in the civil service; and in point of fact it was only obtained for me on that occasion by an exchange.

The medical service of the Honourable Company is now open to everybody, yet the public journals show that there are hardly more candidates than vacancies.

31. There must be a reason for this change in the estimation in which the Indian medical service is

held. Those of the profession whom I have consulted, attribute it to the fact that there are fewer prizes for assistant-surgeons in India now than formerly, and to the increased inducements which the Royal service now holds out.

It is in order to counterbalance these drawbacks, as well as to offer an encouragement which seems just and wise in itself, that I make these proposals in favour of assistant-surgeons, which I beg to recommend to the favour of the Honourable Court.

32. There are several particulars in which the medical service, as a body, lies under great disadvantages, and which they regard, justly in my opinion, as grievances that ought to be removed. I refer to the inequality which now prevails between the position of a medical officer and that of his brother officers, in respect of pension, honours, and rank.

I respectfully submit that such inequalities are founded on no sound grounds of justice, expediency, or policy; no valid reason ever has been or can be alleged for maintaining them. Their effect is to depress the spirit of the medical officer, to depreciate a profession and class of service which ought to be held in the utmost respect, and supported equally from motives of prudence and gratitude.

All such inequalities should be at once removed, and the medical officer, in respect of real rank, dress, honours and promotion, should be placed on a footing with his brother officers who hold the Honourable Company's commission like himself.

33. As the first step towards the removal of these inequalities, one which it is in the Company's own power to take, I respectfully advise the Honourable Court to lend an ear to the memorials which have been addressed to them respecting the retiring pension, and to permit their medical officers to retire upon pensions under the same regulations as all other military officers.

34. Whensoever the opportunity may be open to it, I beg to urge upon the Honourable Court the justice of representing strongly and perseveringly to Her Majesty's Ministers the claims of their medical officers to share reasonably, and in a far larger proportion than they do at present, in the military honours and decorations which are granted for services in the field.

The absurdity of regarding a medical officer as a non-combatant is, I believe, abandoned.

The medical officer comes constantly under fire like other men. Every campaign which is fought exhibits the names of medical officers in the lists of killed and wounded; and the returns invariably show that they still more often fall victims to their own exertions on behalf of their suffering comrades.

Proof can hardly be required of such well-known facts. If it be, the fatal record of the service which our countrymen have been performing during the last year and a half in Turkey and the south of Russia, will more than bear out the statement I have made.

35. But the most galling, the most unmeaning and purposeless regulation by which a sense of inferiority is imposed upon medical officers, is by the refusal to them of substantive rank.

The surgeon and assistant-surgeon rank invariably with the captain and lieutenant, but the rank is only nominal wherever medical officers and others are brought together on public duty: the former has no rank at all, and the oldest surgeon on the list must, in such case, range himself below the youngest ensign last posted to a corps.

36. It is impossible to conceive how such a system as this can have been maintained so long, on the strength of no better argument than that "it has been," therefore "it ought to be."

It is impossible to imagine what serious justification can be offered for a system which in respect of external position postpones service to inexperience, cunning to ignorance, age to youth; a system which gives a subaltern who is hardly free from his drill precedence over his elder who, perhaps, has served through every campaign for thirty years; a system which treats a member of a learned profession, a man of ability, skill,

and experience, as inferior in position to a cornet of cavalry just entering on the study of the pay and audit regulations; a system, in fine, which thrusts down grey-headed veterans below beardless boys.

37. It is not necessary to refer to parliamentary evidence or to memorials for testimony to the reality of this grievance. Its occurrence is notorious. It has happened frequently; it has happened within my own knowledge, and not three months ago.

38. I trust that the Honourable Court will put forth all their energies to obtain from Her Majesty's Government (from which, I presume, it must proceed) an abrogation of this regulation so humiliating to medical officers, and therefore injurious to the service.

39. I have only now to add a few words regarding the numerical strength of the medical establishment.

The Honourable Court have been pleased, not long since, to sanction an augmentation of the medical establishment. But demands are perpetually increasing. The new furlough rules have the power of augmenting largely the number of temporary absentees. The requisitions for medical officers are so constant and so urgent, that it is still found impossible to detain young officers at the presidency for that training which is wisely enjoined by the regulations, and which all authorities concur in regarding as essential to the usefulness of the young assistant-surgeon.

I beg, therefore, to recommend that the medical establishment should be revised annually; that it should be kept up to its full strength, and that either a reserve should be added to it, or that supernumeraries should always be maintained to the extent of at least ten per cent. on the regular strength of the establishment.

40. Lastly, I have to observe, with respect to the financial part of the question, that I do not pretend that the improvements now suggested and recommended can be effected without additional expense. Undoubtedly additional charge will be involved in these proposals. But I do not from that reason shrink from recommending them. I believe that the ordinary revenue of the country will be found amply sufficient to bear any such small additional charge, and I sincerely trust that the Honourable Court will not be deterred by such a consideration from introducing into the system of its medical service the great amendment of which it is susceptible, and which it so much needs.

41. I will now close this minute by recapitulating the several suggestions and recommendations which have been made therein regarding the medical service of the East India Company.

I. That the several medical boards should be abolished.

II. That the control and management of the medical department in each presidency should be placed in the hand of a single officer, who shall be called the Director-General. That this officer should be selected from among the superintending surgeons or staff surgeons, and that his tenure of office should be for five years.

III. That the Director-General should be assisted by two officers, to be called the inspector-general of military hospitals, and the inspector-general of civil hospitals and dispensaries, and that they should be selected in the same manner as the Director-General.

IV. That the superintending surgeon should henceforth be appointed invariably by selection, not by seniority.

V. That a grade of staff surgeons should be created, one in each circle, and one at the presidency, who should be appointed by selection from the surgeons.

VI. That assistant-surgeons after seven years' service, and on the recommendation of the Director-General, should, if they are in charge of a regiment, receive the same staff salary as a surgeon holding a similar charge.

VII. That the injurious inequalities which are now maintained between medical and other officers should be removed.

VIII. Especially that medical officers should be permitted to have the same option regarding retiring pension as all other officers of the army.

IX. That medical officers should receive a fair proportionate share of military honours and decorations.

X. Above all, that the relative rank allotted to medical officers should no longer be nominal, but substantive and real; and that medical officers should thus be relieved from the humiliation to which they are now habitually subjected.

XI. That the medical department should not only be kept up to its full strength at all times, but that a reserve or supernumeraries should be maintained, in order that young medical officers may be certain to enjoy those opportunities of gaining experience on their first arrival which the Government is enjoined to provide for them, and which is essential to their efficiency, but which they do not now obtain.

42. I have now the honour to commend this important subject to the careful and the early consideration of the Honourable Court.

(Signed) DALHOUSIE.

February 1856.

MILITARY DESPATCH to the GOVERNMENT of INDIA, dated 10th June 1857. No. 92.

1. We have taken into careful consideration the representation by the Governor-General in council, as contained in your military letter, dated the 28th February 1856, No. 83, and its accompanying minutes, especially that by the Marquis of Dalhousie relating to the medical establishment of the armies of the three presidencies.

2. You were informed in our military letter of the 7th March 1848 of the views entertained by us of the necessity for selecting for the stations of superintending surgeons and members of the board, those medical officers who should be most distinguished for professional science and the zealous discharge of their duties, due regard being had to seniority in the service when the qualifications of the individuals appeared to be adequate to the correct performance of the duties of the office. We, at the same time, authorized you to enlarge the sphere of selection for the medical board, previously limited to superintending surgeons, so as to permit of the appointment of a surgeon of distinguished talents and acquirements in his profession to the office of third or junior member of the board. The appointment of such an officer in the vigour of his age, we observed, would be calculated to infuse new energy into the board, and to render it more efficient for the performance of its various duties.

3. The Governor-General, we regret to observe, met with great opposition when he proceeded to act on this authority, even to the very limited extent of taking the third of the three senior superintending surgeons for a vacancy in the medical board. Your Government must be relieved hereafter from any difficulty on this head.

4. Having resolved to adopt the system of individual responsibility in the military and public works departments, in substitution of management by a board, we have now determined, in conformity with the recommendation of the Go-

vernor General in council, to adopt the same principle for the medical establishments.

5. The several medical boards at the three presidencies are accordingly to be abolished; and the functions heretofore confided to those boards are to be placed in the hands of an officer at each presidency, to be selected for that purpose by the Governor-General in Council, or by the Governors in council. This officer is to be designated Director-General of the medical department, and to be appointed for a term of five years' service, renewable by the Government, if they should think that the interests of the public service will be thereby advanced.

6. The Director-General is to be allowed the services of a secretary and of an adequate office establishment.

7. We shall now notice in succession the several other measures recommended by the Marquis of Dalhousie in the minute of the 1st February 1856.

"That the Director-General should be assisted by two officers, to be called the Inspector-General of Military Hospitals and the Inspector-General of Civil Hospitals and Dispensaries, and that they should be selected in the same manner as the Director-General."

8. We concur to some extent in the views expressed by Mr. J. P. Grant, and not dissented from by the Marquis of Dalhousie, on this part of the proposed new organization.

We have accordingly resolved that the Director-General shall be assisted by one officer in each of the two divisions of the Bengal Territories, viz.,

The Lower Provinces, including Pegu ;—

The North-Western Provinces, including the Punjab ;—
who shall be the inspector of all the hospitals, military and civil, and dispensaries in his division. This officer shall make periodical tours through his division, and shall report the results of his inspection to the Director-General, but he is not to be the channel of correspondence between the Director-General and the superintending-surgeons, who are, as at present, to correspond direct with the head of the medical department. We shall not object to the newly-acquired provinces of Oude being added to the lower provinces of Bengal, if you shall consider it a more convenient division of the respective spheres of duty. The appointment, like that of the Director-General, will be for a term of five years' service, renewable by the Government if the interests of the public service will be thereby advanced.

"That the superintending surgeons should hereafter be appointed invariably by selection and not by seniority."

9. The following is a copy of the existing regulation on this head.

"2. The Governor-General in council deems it proper to declare, with reference to the principle established by the existing regulations of Government on the subject, and to the great importance of the duties to be performed by superintending surgeons, that the succession to such appointments will not depend on seniority alone, but that the selection

will be made with reference to established character for distinguished zeal, strict assiduity, and professional ability, due regard however being had to seniority when not opposed by considerations of a still more powerful nature."

10. It is our wish and desire that this regulation shall be strictly enforced in every case, with a paramount regard to the interests of the public service.

"That a grade of staff surgeons should be created, one in each circle, and one at the presidency, who shall be appointed by selection from the surgeons."

11. This proposal is founded upon the supposition that superintending surgeons are unable to discharge their duties in consequence of the extent of their circles of superintendence. It is proposed that they shall each have a deputy, under the denomination of staff surgeon, who shall perform the duty of superintending surgeon, if that officer leaves head-quarters, and do his duties in the mofussil if he shall depute him for that purpose.

12. These duties are described in the regulations, from which the following is an extract:—

"9. It will be the especial duty of superintending surgeons of divisions, by a frequent personal inspection of all regimental or other hospitals within the limits of the circles, to ensure the most unqualified attention to their professional duties, on the part of the surgeons and assistant-surgeons, subordinate medical officers, and native doctors; to inspect, with particular attention, the journals of medical practice; to correct the errors of inexperience, by instruction to those who require it; and, in general, minutely and scrupulously to enforce the most strict and undeviating execution and observance, by all concerned, of the established rules and regulations of the department."

13. We greatly fear that, if these duties of inspection were delegated to the proposed class of staff surgeons, the advantages of an efficient supervision would be, to a great extent, lost or neutralized. We should, however, not object to the Director-General, after having had sufficient experience, say for 12 months, of the working of the new system, reporting whether he considers the appointment of a limited number of staff surgeons indispensable to the efficiency of the medical service; and, if so, what number he considers to be the least that the exigency requires.

14. Considering the increased facilities of locomotion which the railways now under construction, and in contemplation, will furnish from year to year, we are of opinion that it will not be necessary to add to the present number of superintending surgeons; but we should approve of giving such extra aid as may be absolutely necessary at the head-quarters of each circle to facilitate the preparations of returns and reports, which at present form a large part of the duty of the superintending surgeons.

"That assistant-surgeons, after seven years' service, and on the recommendation of the Director-General, should, if they are in charge of a regiment, receive the same staff salary as a surgeon holding a similar charge."

15. Assistant-surgeons in medical charge of regiments and corps now receive the staff salary of Rs. 165 a month. We consider that it will be sufficient to allow the staff salary of surgeon, viz., 300 Rs. per month, to assistant-surgeons so employed, after 10 years' service; and we approve of the suggestion that these assistant-surgeons shall be designated "first class," and their juniors "second class," assistant-surgeons.

"That the injurious inequalities which are now maintained between medical and other officers should be removed."

"Especially that medical officers should have the same option, regarding retired pension, as all other officers of the army."

16. We have not in any of our despatches relating to the new furlough regulations prescribed a revised and complete scale of retiring pensions for

our medical servants as we have for our military officers. To obviate any doubt upon the subject we now inform you that the following is the scale which we have adopted for the medical branch of our service.

		per ann.	
After	17 years' service	£191	12s. 6d.
"	21	250	" "
"	25	300	" "
"	29	365	" "
"	32	500	" "
"	35	700	" "

The scale of privileged furlough and leave of absence as counting for service for the retiring pension has been already communicated to you.

17. With respect to the "option" referred to by the Governor-General as professed by military officers, of taking pension according to regimental rank or length of service, it is, as you are well aware, quite inapplicable to the medical service under the present system, and will be still more so under the revised system, inasmuch as all appointments above the rank of surgeon are, and will continue to be, staff appointments filled by selection.

18. By the present regulations a medical officer holding the highest appointment, that of member of the medical board, is required absolutely to retire from the service after he has served five years in that appointment, in consequence of which it may happen that, although still fit for service, he is deprived of the opportunity of serving a sufficient time to qualify for the highest rate of pension. We are of opinion that this rule of compulsory retirement from the service should be cancelled; and that a medical officer, who is still fit for the service, may, even if he has passed a tour of duty in the highest appointment, be permitted to return to the performance of other medical duties until he shall have completed 35 years' service; and so be enabled to qualify for the retiring advantages held out to officers of his branch of the service.

"That medical officers should receive a fair proportionate share of military honours and decorations." } 19. We shall continue to use our best endeavours to promote the attainment of this object.

"Above all, that the relative rank allotted to medical officers, should no longer be nominal but substantial and real." } 20. The relative rank of medical with military officers, under the new arrangement, will be as follows :—

Director-General with brigadier-general.

Inspector-general with colonels.

Superintending surgeon with Lieutenant-colonels.

Senior surgeons with majors.

Surgeons with captains.

Assistant-surgeons with Lieutenants.

21. With a view of giving effect to this scale of precedence when military and medical officers are associated in committees convened by the Commander-in-Chief, we desire that the regulation quoted in the margin* be cancelled; and the following

* "Whenever committees composed of military and medical officers are convened by the Commander-in-Chief, the President is invariably to be a military officer, and the members are to take precedence, military officers first, and then medical officers."

regulation substituted for it, viz., whenever committees composed of military and medical officers are convened by the Commander-in-Chief, the President is invariably to be a military officer; and the members are to take precedence according to their relative rank.

22. The further regulation quoted in the margin † is, we conclude, in operation at the three presidencies.

† "6. When committees are convened by Government, composed of military and medical officers, or of these and civilians also, the relative precedence of the members is to be that in which they are named in the order convening the committee. In such cases the President may belong to any branch of the service."

That the medical department should not only be kept up to its full strength at all times, but that a reserve, or supernumeraries, should be maintained, in order that young medical officers may be certain to enjoy those opportunities of gaining experience on their first arrival, which the Government is enjoined to provide for them, and which is essential to their efficiency, but which they do not now obtain.

23. Your medical establishment is now, we believe, complete. We will take measures for adding and keeping up 20 supernumerary assistant-surgeons for the object here mentioned during the next two or three years; but you will bear in mind that a highly-qualified class of native medical officers, taught in the medical colleges in India, is rapidly coming

forward, who will be available for various medical appointments.

24. We concur with the recommendation of your Government that the Director-General, the Inspector-General, and the superintending surgeons shall be appointed by the Governor-General in council, or the Governors in council.

25. In all medical appointments, whether by the Governor-General in council, the Governors in council, the Lieutenant-Governors, or the Commanders-in-Chief, the opinion and advice of the Director-General will doubtless be sought before the appointment is proposed; but the responsibility for the several appointments must rest with the high authorities by whom they are respectively made.

26. It only remains that we should express our views on the scale of salary for the three grades of medical superintendents.

27. Salaries at the following rates we consider to be adequate, viz.,

Director-General, Bengal.

Consolidated pay and allowances } Rs. per mo., 3,000

Inspector-General of Hospitals.

Consolidated pay and allowances } " " 2,000

Superintending Surgeons.

Consolidated pay and allowances } " " 1,800

with such compensation for travelling expenses as may be considered to be necessary.

28. We leave it to your Government to adopt such measures with regard to the present members of the medical boards who may not be selected for employment, as, without delaying the adoption of the new system, and without reducing the allowances of incumbents, shall allow them to serve the remainder of their tour of five years' service in the way most advantageous to the public interests. They may probably be usefully employed in bringing up the medical reports to the date of the commencement of the new system, so that the Director-General shall commence without arrears.

29. Finally, you will prepare an arrangement for adapting the new system to the Presidencies of Madras and Bombay. At Madras the appointment of a Director-General may be authorized at a salary of Rs. 2,700 a month; at Bombay at a salary of Rs. 2,500 a month; and at each of those Presidencies an Inspector-General of hospitals, at a salary of Rs. 1,900 a month. The number and allowances of the superintending surgeons at Madras and Bombay will be continued on the present scale.

We are, &c.,

APPENDIX XVIII.

(Prepared by the Secretary.)

MEMORANDUM relative to the CONSTITUTION of the ARMY MEDICAL BOARD.

THE earliest notice of a distinct administrative organization is in 1756, when Lord Barrington, Secretary-at-War, was directed "to establish an "Hospital Board for the medical service of the army "intended to take the field, that under their constant "direction this part of military service (relating alike "to medicines, hospital stores, and every other requi- "site provision for the sick) might be carried into "execution with ability, regularity, and despatch." The Board was composed of the physicians belonging to the hospitals of Her Majesty's Forces, the surgeon-general, and the principal surgeon and purveyor to the hospitals.

Subsequently the constitution of the Board was changed and consisted of two members only, the physician-general and the surgeon-general, who was also inspector of regimental infirmaries.

In 1793 the two last-named appointments were separated, and the inspector of regimental infirmaries was added as a third member to the Board, in which collectively was vested the general superintendence of the department, and the sole right of recommending individuals for commissions and officers for promotion, the instruction to the members being "always to "consult together regarding appointments."

But in 1798 they ceased to act as a Board; distinct duties and patronage were assigned to the members, each being made responsible solely for his own acts. The physician-general recommended the physicians for appointments; the surgeon-general recommended the deputy inspectors, regimental and staff surgeons, and assistant surgeons; and the inspector-general had the nomination of apothecaries and hospital mates.

In 1810, on the recommendation of a Parliamentary Committee, the Board was dissolved, and a director-general of army hospitals appointed, with two principal inspectors of hospitals to assist him but having no control in the management of the department. In 1816 the two principal inspectors were discontinued, but in 1818 one of them was restored as professional assistant to the director-general. Since 1833 this appointment has always been held by a staff surgeon or a deputy inspector.

In 1851 the appointment of director-general was abolished, and that of superintendent of the Army Medical Department substituted, but it was restored in 1853, when the Ordnance Medical Department was amalgamated with that of the army.

APPENDIX XIX.

(Given in by Dr. A. Smith.)

On the ESTABLISHMENT required for the OFFICE of the ARMY MEDICAL DEPARTMENT.

Memorandum.

For the duties to be discharged in the office of the Army Medical Department at head quarters, the following officers are in my opinion required,—

- 1 Director-General,
- 2 Inspectors-General,
- 1 Staff surgeon, 1st class,
- 2 Staff surgeons, 2nd class,
- 1 Assistant staff surgeon,
- 1 Apothecary, and
- 1 Dispenser of medicines.

1st. The Director General, to superintend and direct generally the department on home and foreign stations, to provide medical officers for the service, and apportion them to the stations where they are required; to personally communicate with the Minister for War, the Commander-in-Chief, the military secretary, the adjutant-general, and the quartermaster-general, and to furnish them with verbal or written opinions when required in reference to matters relating to the public service; to communicate also with the secretary for the colonies in reference to matters connected with the colonies, &c., &c.

2nd. An inspector-general (the senior), to act as professional assistant to the Director-General; to conduct all professional correspondence; to sit as president of all boards on sick or wounded officers of the various departments of the military service, and also on boards ordered to report on persons belonging to the civil service connected with the army, the treasury, the colonies, &c., &c.

3rd. The second inspector-general, to make periodical inspections of the general and regimental hospitals of the kingdom, and report to the Director-General in detail how the professional duties are discharged in each, and if all the sanitary precautions are taken which are calculated to give every chance of recovery to the sick and secure a continuance of health to the well; also to officiate as president of a

board for statistical purposes, direct its proceedings while he is in London, and furnish instructions for its guidance during the time he is absent on inspections.

4th. One staff surgeon of the 1st class, to manage, in conjunction with the purveyor-in-chief, the affairs of the purveying department.

5th. One staff surgeon of the 2nd class, to inspect all the medicines and instruments furnished for the use of the army and colonial department before they are despatched from the suppliers, and reject all such as are not considered first rate; to examine the numerous medical bills sent to the office for remuneration for services rendered to the army by private practitioners, both in the United Kingdom and the colonies.

6th. The second staff surgeon of the 2nd class, to act as a member of the statistical board, and direct its proceedings during the absence of the president on tours of inspection.

7th. One staff assistant-surgeon, to form the junior member of the statistical board, and work in concert with the president and the other member, while the former is in London, and with the other member when the president is absent.

8th. An apothecary to the forces, to examine all requisitions for medicines, instruments, &c., and also the numerous returns connected with the apothecary's department; to check the accounts of the suppliers of medicines and instruments; to check the accounts in triplicate required by the War Office and the Colonial Department, some of which form moderately thick folio volumes. The amount of duty required of this officer is very great.

9th. A dispenser of medicines, to act partly as clerk to the apothecary, and partly to assist him in checking the requisitions and accounts, it being frequently necessary for two to be employed on the same return.

APPENDIX XX.

(Given in by Mr. Milton.)

WARRANT regulating the PURVEYOR'S DEPARTMENT.

VICTORIA R.

WHEREAS We have considered it necessary for the improvement of Our Service, and for the better providing for the duties of the Purveyor's Department, that the ranks and classes of that department should be extended, and the rates of pay and half-pay of the officers and clerks thereof be regulated and amended: Our Will and Pleasure thereof is, that instead of the provisions contained in Our Royal Warrant of the 27th April 1853, re-establishing the Purveyor's Department, those contained in this Our Royal Warrant, to be administered and interpreted by Our Secretary-at-War, shall from the date hereof be the sole authority regarding that department of Our Service.

1. The purveying department of the army shall consist of a purveyor-in-chief, a deputy purveyor-in-chief, purveyors, purveyor's clerks of the 1st class, and purveyor's clerks of the 2d class.

2. The full pay of these officers and clerks shall be according to the accompanying table:—

Pay.	Purveyor-in-Chief. per diem.	Deputy Purveyor-in-Chief. per diem.	Purveyors. per diem.	Clerks 1st Class. per diem.	Clerks 2nd Class. per diem.
On appointment	£ s. d. 1 5 0	£ s. d. 0 15 0	£ s. d. 0 10 0	£ s. d. 0 8 0	£ s. d. 0 7 0
After 5 years' Service -	1 7 6	0 17 0	0 12 0	0 9 6	0 7 0
" 10 " -	1 10 0	0 19 0	0 13 6	0 11 6	0 8 0
" 15 " -	1 10 0	1 1 0	0 15 0	0 12 6	0 9 0
" 20 " -	1 10 0	1 1 0	0 16 6	0 14 0	0 10 0
" 25 " -	1 10 0	1 1 0	0 18 0	0 14 0	0 10 0
" 30 " -	1 10 0	1 1 0	1 0 0	0 14 0	0 10 0
<i>Allowances.</i>					
Ordinary Field Allowance -	0 3 0	0 2 6	0 2 0	0 1 0	0 1 0
Extra Ordinary ditto -	0 5 0	0 4 0	0 3 6	0 1 6	0 1 6
	No.	No.	No.	No.	No.
Servants, or allowance in lieu -	2	2	1	1	1
Forage for Horses, if necessarily kept -	2	2	1	1	1

3. The purveyor-in-chief, deputy purveyor-in-chief, and the purveyors, shall be commissioned officers, and shall have the following relative ranks:—

The purveyor-in-chief, as major, according to the date of his commission as such.

The deputy purveyor-in-chief, as captain, according to the date of his commission as such.

The purveyors, as lieutenants, according to the dates of their commissions, during the first ten years of their service in the department; but after that time as captains, but as junior of that rank.

4. These officers, if placed on half-pay by reduction of establishment, or in consequence of ill-health contracted in the service, or after 25 years' full pay service, in which last case they shall have the right to retire upon half-pay, will be allowed the half-pay to which their total service in the department, as specified in clause 10 of this warrant, shall entitle them, according to the following table:—

	Purveyor-in-Chief. per diem.	Deputy Purveyor-in-Chief. per diem.	Purveyors. per diem.
After 10 years' Service -	£ s. d. 0 14 0	£ s. d. 0 10 0	£ s. d. 0 5 0
" 15 " -	0 14 0	0 10 0	0 7 0
" 20 " -	0 17 0	0 13 0	0 8 0
" 25 " -	0 17 0	0 13 0	0 9 0
" 30 " -	1 0 0	0 16 0	0 10 0

5. Any officer, retiring at his own desire after 25 years' full-pay service, will be entitled to the rate assigned to his rank and service in the above table, provided he shall have served three years in the rank from which he retires; but if he shall not have served three years in such rank he shall only receive the rate attached to the rank from which he was last promoted.

6. The widows and families of these officers will be allowed the pensions and compassionate allowances granted to officers of their relative ranks by the Pension Warrant of 15th June 1855, subject to all the conditions and restrictions stated in the said warrant.

7. These officers must, if so required by the Secretary-at-War, give such security for the due care of public monies entrusted to them as the Secretary-at-War may be pleased to direct.

8. The purveyor's clerks will not receive commissions, but will hold temporary appointments. They will not be entitled to any half-pay on reduction, or retirement, nor will their widows or families be entitled to any pensions or compassionate allowances.

9. The purveyor's clerks will have the following relative ranks:—

Purveyor's clerk of the 1st class, as ensign, according to the date of his appointment.

Purveyor's clerk of the 2nd class, as ensign, but as junior of that rank.

10. Service in the inferior ranks will be allowed to reckon, if continuous, towards increase of full-pay, in the higher ranks; but a clerk or officer will be required on promotion to serve one year on each rate of pay of the rank to which he shall be promoted, commencing at the minimum of each rank, until he shall have attained the rate of pay warranted by the whole of his service.

The purveyor-in-chief will be allowed to reckon only one third, and the deputy purveyor-in-chief only one half, of their service as purveyor, or purveyor's clerk, towards increase of full pay in their respective ranks of purveyor-in-chief, and deputy purveyor-in-chief.

Given at Our Court at Saint James', this thirty-first day of October 1855, in the nineteenth year of our reign.

By Her Majesty's Command,
PANMURE.

* Labourers, sempstresses, and scrubbers, &c., to have 2d. a day in lieu of beer, and the matron, porter, and butler, 10d. a day in lieu of rations.

N.B.—As this Scale provides liberally for each class of patients, medical officers are carefully to avoid all deviations from it as far as their duty towards the sick may permit.—Such patients (not exceeding six) as may be inclined, are to be admitted to attend the weighing, measuring, &c. of the provisions in the morning, and serving them out when cooked.

APPENDIX XXIII.

(Extract from the Bengal Medical Regulations.)

BENGAL.

TABLE of DIETS for HOSPITALS of EUROPEAN TROOPS.

BREAKFAST.				
FULL DIET.	HALF DIET.	LOW DIET.	MILK DIET.	SPOON OR FEVER DIET.
Tea, $\frac{1}{2}$ oz. Bread, 1 lb. Butter, 1 oz. Sugar, $\frac{1}{2}$ oz.	Tea, $\frac{1}{2}$ oz. Bread, 1 lb. Butter, $\frac{1}{2}$ oz. Sugar, $\frac{1}{2}$ oz.	Tea, $\frac{1}{2}$ oz. Bread, 8 oz. Sugar, $\frac{1}{2}$ oz.	Tea, $\frac{1}{2}$ oz. Bread, 1 lb. Butter, $\frac{1}{2}$ oz. Sugar, $\frac{1}{2}$ oz.	Tea, $\frac{1}{2}$ oz. Sugar, $\frac{1}{4}$ oz.
DINNER.				
A pint of broth, with barley, greens, and onions, and 1 lb. of meat, either mutton or beef.	A pint of broth, with rice, barley, greens, or onions, and 8 ozs. of mutton, of good and edible quality, or a pint of chicken soup, with vegetables as above; a chicken or half a fowl, weighing, when ready for being dressed, not less than 8 ozs.	A pint of mutton or chicken broth.	A pint of milk (new) or a pint of rice and milk, with $\frac{1}{2}$ oz. of sugar.	Bread, $\frac{1}{2}$ lb., to be made into panado or pudding, or 4 oz. of sago.
SUPPER.				
A pint of rice gruel, with $\frac{1}{2}$ oz. of sugar, seasoned with ginger or nutmeg, and a glassful of wine, should any be allowed him.	The same as full.	The same as full.	The same as dinner.	The same as breakfast.

In specifying the quantity of each item of meat for the several kinds of diet, it is to be distinctly understood that meat in a raw state is intended, and not meat which has been already boiled.

ARTICLES composing the different Kinds of Diet for a Day.

AVOIRDUPOIS WEIGHT.

FULL.	HALF.	LOW.	MILK.	SPOON.
Meat, 1 lb., either beef or mutton. Bread, 1 lb. Butter, 1 oz. Milk, 1 measure. Sugar, 1 oz. Tea, $\frac{1}{2}$ oz. Rice, 4 oz., for gruel and congee water. Salt, $\frac{1}{2}$ oz. Onions, 1 oz. Pepper, 1 drachm. Ginger, $\frac{1}{2}$ ditto. Nutmeg, $\frac{1}{2}$ ditto. Barley, $\frac{1}{2}$ oz. Flour, $\frac{1}{2}$ oz. Firewood, 2 seers.	Mutton, 8 oz. of good and edible quality, or half a fowl or a chicken. Bread, 1 lb. Butter, $\frac{1}{2}$ oz. Milk, 1 measure. Sugar, 1 oz. Tea, $\frac{1}{2}$ oz. Rice, 4 oz., for gruel or congee water. Salt, $\frac{1}{2}$ oz. Onions, 1 oz. Pepper, 1 drachm. Ginger, $\frac{1}{2}$ ditto. Nutmeg, $\frac{1}{2}$ ditto. Barley, $\frac{1}{2}$ oz. Flour, $\frac{1}{2}$ oz. Firewood, 2 seers.	Mutton, 8 oz. for preparing broth, or a chicken for broth. Bread, 8 oz. Milk, 1 measure. Sugar, 1 oz. Tea, $\frac{1}{2}$ oz. Rice, 4 oz., for gruel or congee water. Salt, $\frac{1}{2}$ oz. Onions, 1 oz. Pepper, 1 drachm. Ginger, $\frac{1}{2}$ ditto. Nutmeg, $\frac{1}{2}$ ditto. Barley, $\frac{1}{2}$ oz. Flour, $\frac{1}{2}$ oz. Firewood, 2 seers.	Bread, 1 lb. Milk, 2 pints and 1 measure for tea. Butter, $\frac{1}{2}$ oz. Sugar, 1 $\frac{1}{2}$ oz. Tea, $\frac{1}{2}$ oz. Rice, 6 oz. for rice or congee water. Salt, $\frac{1}{2}$ oz. Firewood, 2 seers.	Bread, 8 oz., or 4 oz. sago. Sugar, 1 $\frac{1}{2}$ oz., for tea, sago, or panado. Tea, $\frac{1}{2}$ oz. Milk, 2 measures, for tea and panado. Salt, $\frac{1}{2}$ oz. Nutmeg, $\frac{1}{2}$ drachm. Rice, 2 oz. for congee water. Firewood, 2 seers.

N.B.—The half of a fowl or chicken in the above "half diet" is to weigh 8 oz. exclusive of bone.

The undermentioned vegetables shall be considered as part of the authorized hospital dietary, for full and half diet; the kind and quantities of those articles to be employed for that purpose being left to the discretion of medical officers, and included as extras in the separate statements furnished by them, and which are to be subject to check and counter-signature, as heretofore, by superintending surgeons. It is to be understood that the quantity noted opposite each article is intended only as the maximum to be allowed to one man on one day.

	Half.	Full.		Half.	Full.
	lb.	lb.		lb.	lb.
Potatoes	$\frac{1}{2}$	$\frac{3}{4}$	Yams	$\frac{1}{2}$	$\frac{3}{4}$
Pumpkins	$\frac{1}{2}$	1	Ram-tooraees	$\frac{1}{2}$	$\frac{3}{4}$
Cauliflower	$\frac{1}{2}$	1	Turnips	$\frac{1}{2}$	1
Cabbage	$\frac{1}{2}$	1	Carrots	$\frac{1}{2}$	1
Sweet Potatoes	$\frac{1}{2}$	$\frac{3}{4}$			

The issue of such fruits as may be procurable is also sanctioned, when considered actually necessary, to the sick in hospital of European corps, by the commissariat, on a separate requisition from the medical officer, countersigned by the superintending surgeon.

APPENDIX XXIV.

RATION of the EUROPEAN SOLDIER in INDIA.

Extract from General Orders by the Most Noble the Governor General of India, in Council, dated Fort William, October 28th, 1853.

1. * * * The daily ration of the European soldier shall in future consist of 1 lb. of bread, 1 lb. of meat, 4 oz. of rice, 2½ oz. of sugar, ½ oz. of tea, 1 oz. of salt, 8 oz. of vegetables, and 3 lbs. of fire-wood.

2. The meat will be cut up into joints, and such portions of the animal (such as the ribs and upper joints of the forelegs) as are more than two-thirds bone will be excluded from the ration.

3. The rations of vegetables will consist of such descriptions as may be procurable at the several stations of the army during the different seasons of the year.

4. * * * The bread issued in the rations of a soldier is to be of the best quality, and equal to that provided for hospital diet. Mutton will be issued twice a week in lieu of beef, and in the same quantity, whenever circumstances may admit. Coffee may be substituted for tea in the proportion of 2 lbs. of the former to 1 lb. of the latter, whenever tea is not procurable, or coffee may be preferred and is at hand.

5. The ordinary tea rations will consist of one-third of green and two-thirds of black tea, whenever circumstances may admit of the issue of both kinds."

This order is to be considered applicable to the three Presidencies.

APPENDIX XXV.

(Papers given in by Commissary General Adams, C.B.)

No. 1.—FRENCH RATION in the CRIMEA.

		lbs.	oz.	dr.
750 grammes	Bread -	-	1 10	7
100 "	and Biscuit -	-	0 3	8½
650 "	or Biscuit -	-	1 6	14½
300 "	Fresh Beef -	-	0 10	9½
240 "	Salt Pork -	-	0 8	7½
60 "	Rice or Haricot Beans -	-	0 2	1¾
16 "	Salt -	-	0 0	9
16 "	Coffee -	-	0 0	9
21 "	Sugar -	-	0 0	11¾
¼ litre	Wine -	-	gill	1¾
16 "	or Brandy -	-	"	76

And they are allowed to purchase with the above an equal quantity of rice, sugar, and coffee.

No. 2.—RATION of the TURKISH SOLDIERS of the TURKISH CONTINGENT FORCE, paid, subsisted, and clothed by the British Government during the late War in the East.

300 drachms	- Bread -	-	=	33'80
200 "	or Biscuit -	-	"	22'53
120 "	Fresh Beef -	-	"	13'52

80 drachms	or Mutton -	-	oz.	9'01
40 "	or Cavourma, Turkish preserved mutton entirely free from bone	-	"	4'50
27 "	Rice -	-	"	3'04
3 "	Butter -	-	"	0'33
6½ "	Salt -	-	"	0'73
6½ "	Onions -	-	"	0'73
1 "	Oil -	-	"	0'11
1 "	Soap -	-	"	0'11
7 "	Lentils or peas	-	"	0'78

For pilaf twice per week, on Sundays and Thursdays, rice and butter increased for those days as under :—

108½ drachms	- Rice -	-	=	12'22
16½ "	- Butter -	-	"	1'85
17½ "	with an addition of Sugar -	-	"	1'97

The issue of fresh *beef* to the Turkish soldier was only made when mutton could not be obtained.

Salt *beef* was kept in dépôt for issue in case of necessity, and the ration fixed at

60 drachms = oz. 6'76
142 drachms = 1 lb. avoirdupois.

G. ADAMS, C.G.

London, 12th June 1857.

APPENDIX XXVI.

EXTRACT from "COPY of REPORT on the ORGANIZATION of the RUSSIAN MEDICAL DEPARTMENT, and the Sanitary State of their Crimean Hospitals."—*Parliamentary Paper*, 135. sess. 1857, page 8.

DAILY RATIONS for duty men of the RUSSIAN ARMY.

- 1 lb. of black bread.
- 1 lb. of meat.
- 1½ litre of kwass (fermented drink) (=1·1 quarts *English*.)
- ½ ditto of sour cabbage (choux aigre) (=3½ gills *English*.)
- ¼ ditto of barley.
- 22 grammes of salt (=12½ drams avoirdupois.)
- ¼ gramme of horse raddish (=3·86 grains.)
- ¼ litre of vinegar (=1¾ gills.)
- ¼ gramme of pepper (=3·86 grains.)

APPENDIX XXVII.

(Furnished by Order of the Secretary of State for War.)

STATEMENT of the RATES of STOPPAGE for RATIONS, and the several ARTICLES at present furnished, together with the Dates at which the various CHANGES have been made in the STOPPAGE, the Nature of the RATION, and the Mode of SUPPLY, since the Termination of the PENINSULAR WAR.

Troops at Home.

The ration at present issued is,—

1 lb. bread, and

$\frac{3}{4}$ lb. meat,

the stoppage being $4\frac{1}{2}d.$

Since the year 1813 the ration has remained the same, the stoppage at that time being fixed at $6d.$

The warrant of August 1827 limited the stoppage to the actual cost of the ration, *not exceeding* $6d.$ per day; whilst the warrant of February 1833 authorized the issue of a ration to troops encamped in England of,—

$1\frac{1}{2}$ lb. bread, and

$\frac{3}{4}$ lb. meat,

at a similar stoppage, which however was, by warrant of February 1854, *fixed* at $4\frac{1}{2}d.$ per ration.

Provisions for the troops in England were supplied by the Commissary-in-chief and Agent for Commissariat supplies, under the Treasury, from 1813 to 1834, by the Board of Ordnance until 1854, when this service was retransferred to the Commissariat, by which department it has been executed to the present time.

In Ireland, provisions were supplied to the troops by the Irish Commissariat acting under the Lord Lieutenant until 1822, and by the British Commissariat to 1837, from which period to 1847 the regiments provided themselves. The Commissariat resumed the supply from 1847 to 1852, from which time to May 1854 the regimental contract system was again in force, and from that period to the present time the supplies have been furnished by the Commissariat.

Troops on board Ships freighted by the Admiralty.

The ration at present issued consists of,—

1 lb. biscuit or $1\frac{1}{4}$ lb. soft bread	} Daily.
$\frac{1}{8}$ pint spirits	
$1\frac{1}{4}$ oz. sugar	
$\frac{2}{3}$ oz. chocolate	
$\frac{1}{4}$ oz. tea	} Weekly.
$\frac{1}{6}$ pint oatmeal	
$\frac{1}{3}$ oz. mustard	
$\frac{1}{8}$ oz. pepper	
$\frac{1}{6}$ pint vinegar	} Daily when procurable.
$\frac{2}{3}$ lb. fresh meat	
$\frac{1}{3}$ lb. vegetables	
$\frac{3}{4}$ lb. salt pork	
$\frac{1}{3}$ pint peas, or	} On alternate days when fresh provisions cannot be procured.
$\frac{1}{4}$ lb. salt beef	
6 oz. flour	
$\frac{1}{2}$ oz. suet	
1 oz. currants or raisins	

For which a stoppage of $6d.$ is charged; but when spirits, or additional tea and sugar in lieu thereof, are not drawn, the stoppage is only $5d.$

We have no record of the alterations in this ration which has always been furnished by the Admiralty, but the stoppage was fixed by warrant of 1799 at $6d.$, and appears to have continued the same until 1849, when the soldier was allowed the option of not drawing spirits, or an equivalent in tea and sugar, with a reduced stoppage of $5d.$

Troops serving Abroad.

The ration fixed by warrant of December 1850, which is at present issued, consists of—

1 lb. bread, or $\frac{3}{4}$ lb. biscuit,

1 lb. meat, either fresh or salt,

for which a stoppage of $3\frac{1}{2}d.$ is deducted.

The warrant of 6th February 1799 fixed the stoppage to be taken from the soldier when serving out of Great Britain, at stations where provisions were supplied by the public at $6d.$ per ration, except at Jamaica, New South Wales, and Gibraltar, where the stoppage was only $3\frac{1}{2}d.$ per ration.

There does not appear to have been any fixed ration in the Colonies at that time, and the irregularities in the issue of provisions which prevailed at the conclusion of the war in 1815 gave rise to the warrant of 12th July 1816, which limited the ration of provisions in the Colonies, except Jamaica, to—

1 lb. bread or biscuit,

1 lb. meat, either fresh or salt,

1 pint wine, or

$\frac{1}{3}$ pint spirits,

with a stoppage of $6d.$ per ration.

Deviations were allowed in 1818 from this ration at the Cape of Good Hope, where the ration was—

At Head Quarters.

1 lb. bread,

$1\frac{1}{4}$ lb. fresh meat,

$\frac{1}{4}$ lb. rice,

$\frac{5}{7}$ oz. coffee, } in lieu of spirits.

$1\frac{1}{2}$ oz. sugar, }

On the Frontier.

1 lb. bread,

$1\frac{1}{2}$ fresh meat,

2 oz. flour.

until 1826, when the fresh meat was reduced to 1 lb.

In the West Indies also the Treasury, in 1820, sanctioned the following ration,—

1 lb. bread,

1 lb. beef, fresh or salt, or

$9\frac{1}{2}$ oz. salt pork,

$1\frac{1}{2}$ oz. sugar,

$\frac{2}{3}$ oz. cocoa,

$\frac{1}{8}$ pint rum.

The provision warrant of 14th July 1827 altered the ration at stations abroad to—

1 lb. bread or biscuit,

1 lb. meat, either fresh or salt,

$\frac{3}{4}$ quart wine, or

$\frac{1}{4}$ quart rum,

except at those stations where on account of climate, or from local or temporary circumstances, a different ration might be sanctioned by the Treasury, the stoppage still remaining at $6d.$ per ration.

A deviation from this warrant occurred in the year 1828, when the West India ration before stated was extended to Bermuda.

By the warrant of 22d July 1830, the ration to the troops abroad was limited to—

1 lb. bread, or $\frac{3}{4}$ lb. biscuit,

1 lb. meat, either fresh or salt,

except in the cases provided in the warrant of 1827, and in consideration of the allowance of spirits granted by previous warrants having been discontinued, the stoppage from the soldier was reduced to $5d.$ per ration.

Between the years 1830 and 1850 a ration, generally known as the *Tropical Ration*, and composed as follows, viz. :—

- 1 lb. bread, or $\frac{3}{4}$ lb. biscuit, or $14\frac{1}{2}$ oz. flour,
- 1 lb. beef, either fresh or salt, or
- 12 oz. salt pork,
- $1\frac{1}{2}$ oz. sugar,
- $\frac{5}{7}$ oz. cocoa,
- 4 oz. rice, or
- $\frac{1}{2}$ pint peas,

was issued at Bahamas, Bermuda, Honduras, Hong Kong, Mauritius, Jamaica, Sierra Leone, West Indies, and also at St. Helena, with the addition of $\frac{5}{8}$ pint wine, for which, however, the full stoppage of 6d. per ration was exacted at this station. In New South Wales and Van Diemen's Land, $\frac{1}{4}$ quart rum was issued in addition to the ration authorized by warrant of 1830, at a stoppage of 6d.

The warrant of 24th December 1850 restricted the ration to the troops at all stations, without exception, to 1 lb. bread, or $\frac{3}{4}$ lb. biscuit,
1 lb. meat, either fresh or salt,
and at the same time limited the stoppage to $3\frac{1}{2}d.$ per ration, the soldier being left to provide himself with such other articles of diet as might be necessary under regimental arrangements.

The only deviations from this warrant at present are at Hong Kong, where, for the health of the troops, the following ration was sanctioned in May 1856, viz. :—

- 1 lb. bread,
- 1 lb. meat, either fresh or salt,
- 2 oz. rice, or 1 ration preserved vegetables,
- $\frac{1}{4}$ oz. tea,
- $1\frac{1}{2}$ oz. sugar,
- $\frac{1}{64}$ gall. rum,

for which the soldier pays a stoppage of $4\frac{1}{2}d.$

And also at an outpost at the Cape of Good Hope, where a ration composed of,—

- 1 lb. bread, or $\frac{3}{4}$ lb. meal,
- $1\frac{1}{2}$ lb. fresh meat, or 1 lb. salt meat,
- 2 oz. rice,
- 1 oz. sugar,
- $\frac{3}{4}$ oz. coffee,
- $\frac{1}{12}$ gill salt,

is issued, for which a stoppage of 5d. is deducted.

Since the year 1816, the ration to the soldier in the Colonies has been provided by the Commissariat, except at Jamaica, where, until the year 1827, it was

provided under the directions of the Colonial Assembly of that island.

Troops in the Field.

The present ration, as fixed by the warrant of 1850, is,—

- $1\frac{1}{2}$ lb. bread, or 1 lb. biscuit,
- 1 lb. meat, either fresh or salt,

the stoppage being $3\frac{1}{2}d.$

The first record of a fixed field ration is in the warrant of 1830, which authorized the ration above quoted at a stoppage of 5d., leaving to the discretion of the officer commanding the forces the issue of spirits or any other article of subsistence, on deducting an additional 1d. stoppage per ration.

A departure from the above ration occurred in the year 1848 at the Cape of Good Hope, where the troops in the field received a ration, of,—

- 1 lb. bread, or $\frac{3}{4}$ lb. meal, or 1 lb. biscuit,
 - $1\frac{1}{2}$ lb. fresh, or 1 lb. salt meat,
 - 2 oz. rice,
 - 1 oz. sugar,
 - $\frac{3}{4}$ oz. coffee,
 - $\frac{1}{12}$ gill salt,
 - $\frac{1}{28}$ gall. spirits,
- } or an additional $\frac{1}{2}$ lb. fresh meat
in lieu,

at a stoppage of 6d. with, or 5d. without, the spirits.

In the Kaffir war of 1850–53, in addition to the above ration, $\frac{1}{4}$ lb. tobacco and $\frac{1}{4}$ lb. soap, weekly, were issued at the same stoppage.

The warrant of December 1850 restricted the field ration to,—

- $1\frac{1}{2}$ lb. bread, or 1 lb. biscuit,
- 1 lb. meat, either fresh or salt,

at a stoppage of $3\frac{1}{2}d.$, all other articles of diet to be provided under regimental arrangements.

It was, however, found necessary to deviate from the above regulation in the case of the army in the Crimea, where the ration issued to the British troops consisted of,—

- $1\frac{1}{2}$ lb. bread, or 1 lb. biscuit,
 - 1 lb. meat, either fresh or salt,
 - 2 oz. rice,
 - 2 oz. sugar,
 - 1 oz. coffee, or $\frac{1}{4}$ oz. tea,
 - $\frac{1}{32}$ gall. rum,
 - 1 oz. lime juice,
 - $\frac{1}{2}$ oz. salt,
 - $\frac{1}{4}$ oz. pepper,
- } for every 8 men,

the stoppage being raised to $4\frac{1}{2}d.$

The issue of provisions to the troops in the field has always been made through the Commissariat.

RETURN of the various Hospital STOPPAGES from the SOLDIER.

In hospital at home	-	10d.
In hospital abroad	-	9d.
When sick on board ship	-	6d.

In any of these situations, when a soldier is in hospital on account of wounds received in action, or from disease contracted when serving with an army in the field, the stoppage is only that prescribed for provisions supplied to the effective soldiers, viz. :—

- $3\frac{1}{2}d.$ abroad, and
- $4\frac{1}{2}d.$ at home.

Dates at which any Variation has been made since the Peninsular War.

It is understood that the above rates were those that have obtained, without change, ever since the early years of this century. The qualification as to wounds, &c., was granted by warrant of 1848 (W. O. Regulations, 1 July 1848).

APPENDIX XXVIII.

MEMORANDUM by Sir C. E. TREVELYAN, K.C.B., Assistant Secretary to the Treasury, on the Subject of Stoppages from the Pay of the Soldier.

The regulations under which the pay of the army is issued and accounted for urgently stand in need of reform.

The stoppages from the pay of the soldier for the rations supplied to him involve settlements of account of so operose and cumbrous a nature that, although they are gone through in time of peace, at the cost of an enormous waste of labour, the whole system is immediately abandoned at the breaking out of war. In the Caffre wars our commissariat officers reported that they had been unable to keep up the calculations which the system required in reference to the pay of every individual soldier belonging to the numerous detachments moving over the face of the country; and in the late Russian war the attempt was not even made, the Treasury having, at the commencement of the war, authorized the issue of the net regimental pay calculated on the aggregate number of men present with each regiment, without requiring any subsequent detailed settlement. When the soldier was charged with the actual cost of the ration, a periodical adjustment of the sum due by him was necessary; but he now pays a fixed amount for his ration both at home and abroad, and detailed adjustment is therefore no longer required. The practice has survived the occasion for it. A machinery applicable to a bygone state of things ought to be dis-

continued, and our arrangements should be adapted to the actual fact,—which is, that soldiers' wages consist of a net rate of pay, a free ration, free lodging, and various other advantages which are provided for him at the cost of the public.

There is another set of stoppages for officers and soldiers in hospital, which ought to be similarly dealt with.

And another set for officers and men on shipboard, which is the most objectionable of all, because it is complicated with the Naval Regulations, and with various arrangements connected with the different conditions under which messing is provided for the different ranks on board Queen's ships, transports, and freight ships.

Then there are the deductions from the bounty professed to be paid to recruits, which has been the occasion of much discontent, and of many imputations of breach of faith, and caused a mutiny at the recruiting depôt of the Land Transport Corps at Bristol in the late war.

And, lastly, the subsequent stoppages for "necessaries;" but these are closely connected with the interior regimental arrangements, and must therefore be treated with a more exclusive reference to military principles.

Abroad, by
Royal
Warrant,
24 Dec.
1850.

At home,
by Royal
Warrant,
25 Feb.
1854.

APPENDIX XXIX.

(Given in by Commissary General Adams, C.B.)

ESTIMATED COST of the EXTRA ARTICLES proposed to be provided as Part of the SOLDIER'S RATION.—
(Qu. 3689-91)

					<i>d.</i>
Vegetables	-	-	-	-	0·625
Rice	-	-	-	-	0·174
Salt	-	-	-	-	0·008
Pepper	-	-	-	-	0·029
Coffee	-	-	-	-	0·750
Sugar	-	-	-	-	0·625
					<hr/> 2·211
The extra ¼ lb. bread	-				0·383
					<hr/> 2·594

Rum and lime juice are not taken into consideration in this estimate.
London, 12th June 1857.
G. ADAMS, Commissary General.

APPENDIX XXX.

(Given in by Sir A. M. Tulloch, K.C.B.)

SCHEME of DIETARY for SOLDIERS proposed by Colonel Sir A. M. Tulloch, K.C.B. (Qu. 6220-40.)

BREAKFAST.				SUPPER.			
Bread	-	-	8 oz.	Bread	-	-	8 oz.
Coffee	-	-	$\frac{2}{3}$ „	Tea	-	-	$\frac{1}{4}$ „
Sugar	-	-	1 „	Sugar	-	-	1 „
Milk	-	-	1 gill	Milk	-	-	1 gill

DINNERS.

No. 1.	Irish	{	Mutton	-	12 oz.	No. 2.	Salt Beef or Pork	-	12 oz.		
	Stew		Potatoes	-	16 „		Pease	{	Pease	-	$\frac{1}{3}$ pint
			Onions	-	$\frac{1}{2}$ „		Soup	{	Onions	-	$\frac{1}{2}$ oz.
	Rice	{	Rice	-	$2\frac{2}{3}$ „		Colcannon	{	Potatoes	-	8 „
	Pudding		Milk	-	$2\frac{3}{5}$ gill				Greens	-	8 „
			Sugar	-	11 drams		Bread	-	-	-	$5\frac{1}{3}$ „

Dinners—*cont.*

No. 3.	Mutton, baked	-	12	oz.
	Potatoes	-	16	"
	Yorkshire { Flour	-	5	"
	Pudding { Suet	-	$\frac{1}{2}$	"
No. 4.	Beef boiled	-	12	oz.

	Bread	-	$5\frac{1}{3}$	"

No. 8.	Soup made of the Head, Shanks, and Feet,			
	Roast Heart,			
	Fried Liver,			
	And Tripe.			

Note.—Since Dr.Christison's analysis of this diet has been communicated to me, I propose to substitute, on the first day, suet for rice pudding, composed of 3 oz. of flour, one of suet, and about one of sugar; also to add to the seventh day's dinner $\frac{1}{2}$ lb. of potatoes and two oz. of cheese, to be eaten with the extra bread charged on that day, which would bring the nutritive properties of the diet to about the same average as for the rest of the week, and add only a small fraction to the expense.

APPENDIX XXXI.

ESTIMATE of the probable COST of the DIETARY for the SOLDIER, proposed by Colonel Sir A. M. TULLOCH, K.C.B., in his Evidence before the Commission, page 209, Qu. 6,220-40.

The minimum pay of the British soldier of infantry in the United Kingdom is 1s. 1d. per day, less $4\frac{1}{2}d.$ for a ration of 1 pound of bread, and $\frac{3}{4}$ of a pound of meat, leaving a surplus of $8\frac{1}{2}d.$ In the Colonies the pay is 1s., less $3\frac{1}{2}d.$ for a ration of 1 pound of bread and 1 pound of meat, leaving a like surplus as at home.

From this surplus have to be deducted $\frac{1}{2}d.$ per day for washing, about 2d. per day for necessities, barrack damages, sheet washing, and small charges, 1d. per day to buy beer at home or wine abroad, in lieu of the issue formerly made to the soldier in kind, and there should remain also 1d. per day for pocket-money, making a total of $4\frac{1}{2}d.$, leaving to be expended on messing, in addition to the ration, about 4d. per diem.

I shall first consider what portion of this requires to be applied to the breakfast and supper meal, viz. :—

BREAKFAST.		d.
Bread, 8 cz., charged in ration	-	-
Coffee, $\frac{2}{3}$ of an oz., at 9d. per lb.	-	$\frac{6}{16}$
Sugar, 1 oz. at 3d. per lb.	-	$\frac{3}{16}$
Milk, $\frac{1}{4}$ of a pint, at 1d. per quart	-	$\frac{1}{16}$
SUPPER.		
Bread, 8 oz., charged in ration	-	-
Tea, $\frac{1}{4}$ of an ounce, at 1s. 4d. per lb.	-	$\frac{4}{16}$
Sugar and milk as above	-	$\frac{5}{16}$
Total	-	$1\frac{4}{16}d.$

The sugar has been calculated at about 25s. per cwt., which is above the usual maximum price in the Navy. The tea has also been calculated considerably in excess of the Navy price, which is only about 11d. a pound; and the coffee has been taken at the price at which it was purchased by the Navy during the Russian war.

These supplies, however, are all estimated, *without duty*, as obtainable on foreign stations. It is presumed that when issued by the commissariat in this country, arrangements could be made for their being also duty free here; but if that cannot be conceded, and it is considered inexpedient for the messing charge at home to exceed that in the colonies, cocoa might be issued either in the morning or evening, in place of tea. Its cost being only $4\frac{3}{4}d.$ a pound, and the duty as well as that on coffee and sugar being limited to a very small amount, the expense of the breakfast and supper at home would, by this change, be much the same as in the colonies. Assuming, then, the cost of these meals, excluding bread, at $1\frac{1}{4}d.$ per day, there will remain $2\frac{3}{4}d.$ to be expended in such additions as are required to make the three-fourths of a pound of meat at home, or 1 pound on foreign stations, provide a good and substantial dinner for the soldier.

The following is the arrangement of the dinners, by which it is proposed to effect this, keeping in view that when there is no pudding, one-third of a pound of extra bread would have to be purchased, as the ration quantity would be consumed at breakfast and supper.

The prices of the chief items of each dinner, exclusive of the ration, are based on the following estimate :—

Potatoes, according to prices given in Navy Victualling List, 4s. 9d. a cwt., or about $\frac{1}{2}d.$ a lb.
Onions (per ditto) about $\frac{3}{4}d.$ per pound.
Other vegetables averaging, say $\frac{1}{2}d.$ per lb.
Bread, 2d. a lb.
Flour, about 2d.
Split pease, $1\frac{1}{2}d.$ per lb.
Rice, pearl barley, or sago, about 2d. a lb., the rice taken at the same price as purchased at the Royal Military Asylum.
Suet, $7\frac{1}{2}d.$
Raisins, $6\frac{1}{2}d.$

According to these prices, the dinner for the first day would cost,—

	d.
1 lb. of potatoes per man, to make Irish stew with the ration meat	$\frac{8}{16}$
Onions and herbs for seasoning, say	$\frac{1}{16}$
Baked rice pudding, according to cost at Military Asylum, reckoning the same quantity for 75 men as for 100 boys	1
Total	$1\frac{9}{16}d.$

For the second day,—

$\frac{1}{3}$ of a pint of pease to make pease soup with the pork	$\frac{8}{16}$
Onions and seasoning for ditto, say	$\frac{1}{16}$
$\frac{1}{2}$ lb. of potatoes, and $\frac{1}{2}$ lb. of greens mashed, to be eaten with the pork	$\frac{8}{16}$
$\frac{1}{3}$ of a pound of bread at 2d.	$\frac{11}{16}$
Total	$1\frac{1}{2}d.$

For the third day,—

1 pound of potatoes, to be placed under the baked or roast mutton	$\frac{8}{16}$
$\frac{1}{3}$ of a pound of Yorkshire pudding, according to cost at Military Asylum reckoning same allowance for 75 men as for 100 boys	1
Total	$1\frac{8}{16}d.$

For the fourth day,—	<i>d.</i>
$\frac{1}{2}$ a pound of vegetables for soup -	$\frac{4}{16}$
2 ounces of rice, pearl barley, or sago, for thickening it - - - -	$\frac{4}{16}$
1lb. of potatoes to be eaten with the meat - - - - -	$\frac{8}{16}$
$\frac{1}{3}$ of a pound of bread with soup -	$\frac{11}{16}$
Total - - -	$1\frac{11}{16}d.$
For the fifth day,—	
One pound of potatoes, to be placed under roast beef - - - -	$\frac{8}{16}$
One-third of a pound of plum- pudding, comprised of the following materials:—	
3 lb. of flour, cost - - -	6 <i>d.</i>
1 lb. raisins (chopped fine) -	$6\frac{1}{2}$
1 lb. suet - - - -	$7\frac{1}{2}$
1 lb. sugar - - - -	3
For 18 men - - -	1 <i>s.</i> 11 <i>d.</i>
Being for each - - -	$1\frac{5}{16}$
Total - - -	$1\frac{13}{16}d.$
For the sixth day,—	
Same price as on fourth day, the only difference being mutton for the soup instead of beef - - - -	$1\frac{11}{16}d.$
For the seventh day,—	
Vegetables for stewing with beef $\frac{1}{2}$ lb.	$\frac{4}{16}$
Potatoes $\frac{1}{2}$ lb. - - - -	$\frac{14}{16}$
$\frac{1}{3}$ of a lb. of bread - - - -	$\frac{11}{16}$
Total - - -	$1\frac{3}{16}d.$

The expense of the proposed eighth day's diet I need not go into, for that would be considerably less than under the present system, as the materials proposed to be made use of would otherwise be sold much under the usual cost of the ration.

The total cost of these several days dinners would therefore be under one shilling a week, or $1\frac{3}{4}d.$ a day in addition to the ration, leaving one penny a day still available to meet any increased cost, or where that did not occur, to add butter to the morning, or cheese to the evening meal, for the whole should be expended.

If the additional third of a pound of bread were dispensed with on four days in the week, and pudding added on every day, which probably the soldier would prefer, it would only cost the difference between $2\frac{1}{8}d.$, the price of $1\frac{1}{3}$ lb. of bread, and $4\frac{1}{16}d.$, the price of $\frac{3}{4}$ lb. of plum-pudding for 2 days, and suet and rice-pudding on the other two. Even with this improvement in the diet the stoppage for dinner would only be $2d.$ a day instead of $1\frac{3}{4}d.$, leaving still about $\frac{3}{4}d.$ over.

For this important variety and improvement in the diet, it is only requisite that the orders already existing should be carried into effect by the soldier being messes up to the full amount authorized by regulations,

(See Note at end of preceding Appendix.)

and taught to exercise a little ingenuity in the preparation of his food, which, it is hoped, would prove a useful and pleasing variety in his duties.

A bakehouse would no doubt be required in every regiment, but the expense of it would soon be covered, and a great improvement effected, by some of the men learning to bake their own bread. The description of bread might then also be varied occasionally with advantage.

The commissariat would, under the proposed arrangement, have to be charged in future with the issue of flour, suet, rice, raisins, pease, sugar, barley, &c., as on shipboard, in addition to the usual ration of bread and meat, and for which extras, if $2\frac{1}{2}d.$ were to be added to the present price of the ration, making a total of $7d.$ at home, or $6d.$ in the colonies, it would leave $1d.$ per day for the soldier to supply himself with vegetables and milk, which it might be inconvenient and often difficult for a commissariat officer to provide satisfactorily.

In the field, however, a ration of preserved vegetables and preserved potatoes should be issued by the commissariat at a charge of $1d.$, whenever the soldier could not obtain these supplies in kind. Milk in such situations would probably not be obtainable.

To ensure the satisfactory working of these messing arrangements, the division of the meat into roasting, boiling, and stewing pieces would require to be carefully made. Those parts least adapted for roasting or stewing to be used for the days on which soup was made.

Difficulty might at first be experienced in cutting up the meat, so as to ensure the exact quantity to each mess in one piece, for it would be objectionable to have small pieces, which run to waste in cooking; to obviate this, however, it might be arranged that any quantity short of a pound in the piece might be made up on the following day, the serjeant keeping a tally against the contractor; any similar quantity in excess being adjusted in the same way. There need be no greater difficulty in this respect than the issue of salt beef or salt pork, which is given out in pieces as being of a certain weight, though often considerably below or over it.

If the quantity of meat which must necessarily be cut into small portions to give a proper size to roasting or boiling pieces be considerable, the eighth dinner might, instead of the other materials, occasionally be of meat pie, with a crust of flour and lard, which is always a favourite with the soldier, and would not add materially to the average cost of the messing.

This routine of messing is intended to apply to a battalion of eight companies, in which each company should have daily in succession the dinners here described, so that all might not be roasting, boiling, baking, or stewing, on the same day.

For a small detachment, there might be a difficulty in following this routine, but an exceptional case of this kind which might occur affords no good reason why our soldiers should not have as varied a diet when in large bodies as circumstances and the rate of their pay will admit.

APPENDIX XXXII.

OBSERVATIONS ON Sir A. M. TULLOCH'S proposed SCHEME of DIETS for SOLDIERS. By Dr. CHRISTISON.

I have examined the scheme of diets for soldiers proposed to the Commissioners by Sir A. M. Tulloch, with the view of ascertaining "whether it appears to contain the carboniferous and nitrogenous constituents in the most desirable proportions;" and I append the numerical results.

In making the calculations I have used ascertained data as to the composition of most of the articles in the several diets. I have been obliged, however, in absence of experimental data, to assume conjecturally the constitution of raisins and onions; and I have assumed the nutritive constitution of salt meat to be

the same as that of fresh meat. Raisins and onions form only a very small proportion of the dinners of which they are a part, so that there can be no serious error under these heads. But it is certain that salt meat is not so nutritive as fresh meat. Since there are no data, however, whether scientifically or practically, for determining, even approximately, the total nutriment, or the relative carboniferous and nitrogenous nutriment of salt meat, I do not see what other method I can well follow except to use the data for fresh meat, with the reservation now attached.

The first Table shows the carboniferous, nitrogenous, and total true nutriment in the seven different dinners, and separately the same nutritive constitution of the breakfast and supper conjunctly, which do not vary from day to day.

TABLE FIRST.			
<i>Showing the Nutritive Constitution, in ounces, of the several Dinners of the proposed Scheme of Diet, and of the daily Breakfast and Supper conjunctly.</i>			
—	Carboniferous Nutriment.	Nitrogenous Nutriment.	Total Nutriment.
	oz.	oz.	oz.
First dinner	8·05	3·44	11·49
Second do.*	10·09	4·54	14·63
Third do. -	9·77	3·63	13·40
Fourth do. -	10·33	3·81	14·14
Fifth do. -	9·74	3·23	12·97
Sixth do. -	10·33	3·81	14·14
Seventh do.	7·04	3·21	10·25
Breakfast and Supper }	11·04	2·13	13·17

The second Table shows the constitution of the diets for the whole day during seven successive days. That of the diet for the eighth day, of course, cannot be computed, as data cannot be supplied.

TABLE SECOND.			
<i>Showing the Nutritive Constitution, in ounces, of the whole daily Food on seven successive days.</i>			
—	Carboniferous Nutriment.	Nitrogenous Nutriment.	Total Nutriment.
	oz.	oz.	oz.
First day -	19·09	5·57	24·66
Second do. -	21·13	6·67	27·80
Third do. -	20·81	5·76	26·57
Fourth do. -	21·37	5·94	27·31
Fifth do. -	20·78	5·36	26·14
Sixth do. -	21·37	5·94	27·31
Seventh do.	18·08	5·34	23·42

* NOTE.—The peas for this dinner I assume to be split peas, which weigh 7,100 grains, or almost exactly a pound per pint.

These several diets approach on the whole nearly in total real nutriment to the allowances for the British Navy, which contain 28½ ounces of daily nutriment on an average, and which have been found very suitable. The diet of the first and seventh days alone are materially less. It would require an addition of four ounces of meat and four ounces of bread to make them equal to the Navy allowances. This addition would raise their nutritive value as follows:—

	oz.	oz.	oz.
First day -	21·75	6·70	28·45
Seventh do -	20·74	6·56	27·30

The relative proportion of the carboniferous to the nitrogenous nutriment of the seven diets approaches nearly to that which scientific analysis has shown to be very exactly the proportion in the dietaries hitherto examined, which have been practically found satisfactory, viz., the ratio of three to one. Every day's allowance, however, appears appreciably short of this proportion, except the second; and the closer approach of that day's diet depends on the nutritive value which I have assumed for salt meat, and which I have admitted to be over-estimated. The diet of the first, fifth, and seventh days deviates most from the general rule. Each of these ought to present

about one ounce more of real nitrogenous nutriment, to bring it under the rule. In every way Nos. 1 and 7 therefore appear rather defective.

I will not say positively that in practice these occasional deficiencies would tell on the actual nourishment of the men. But equally from scientific analysis and from past practical observations, it is probable that they would do so. It is easy, however, to test the fact by experiment, viz., by weighing the men of a company in each of several regiments at the end of the fourth and eighth weeks. And, indeed, if I may be permitted to advise in this matter, I would recommend that this test should be applied, whatever scheme of diet may be ultimately adopted.

I apprehend I am to assume that the proposed diets are intended for soldiers in ordinary circumstances. When they have to encounter prolonged fatigue, exposure, and defective sleep, a larger allowance is necessary. Nothing can be more certain, at least, than that, in civil life, the nutriment must rise materially with the bodily exercise, exposure, and night-watching, otherwise work cannot be done so well, and the seeds of disease are ultimately sown.

Edinburgh,
11th November 1857.

APPENDIX XXXIII.

(From the Report of the Crimean Commissioners.)

OBSERVATIONS ON A REPORT BY SIR JOHN MCNEILL, relative to the RATIONS for SOLDIERS.

By Dr. CHRISTISON.

IN consequence of the advances made in physiology and chemistry, the nutritive value of any dietary, deduced from practical experience, may be tested with care and certainty by reference to its chemical composition. As this fact is little known to practical men, it may be well to explain the principles on which the method is founded.

1. All articles of food used by man consist of one or more, and generally several nutritive principles; and most of them contain water and an indigestible cellular tissue. The two latter must, of course, be deducted in estimating nutritive value.

2. The nutritive principles consist of two sets—one of which maintains respiration, and the other repairs the waste constantly incurred by the animal textures

in the exercise of their functions. As the respiratory principles commonly abound in carbon, they are sometimes called carboniferous, while the reparative principles, because they all contain nitrogen, are termed nitrogenous.

3. Experience has shown that the most successful dietaries for bodies of men, deduced from practical observation, contain carboniferous and nitrogenous food in the proportion of about three of the former to one of the latter, by weight. During two-and-twenty years that my attention has been turned to the present subject, not a single exception has occurred to me.

4. Hence it is obvious that the least weight of food in the rough state will be required, first, when there is least moisture and cellular tissue in it; and secondly

when the carboniferous and nitrogenous principles are nearest the proportion of three to one.

5. Of the various nutritive principles belonging to each set, some may replace one another; some are better than others; some are probably essential. This branch of the science of the subject is unfortunately still imperfect.

6. Two things, however, are certain—that nitrogenous may replace carboniferous food, for supporting respiration, though at a great loss; but that carboniferous food (without nitrogen) cannot replace nitrogenous food, for repairing textural waste.

7. The daily amount of nutritive principles of both sets must increase with exercise and exposure, otherwise the body quickly loses weight, and ere long becomes diseased. If the above proportion between the two sets be maintained, the weight of real nutriment per day varies, for adults at an active age, between seventeen and thirty-six ounces; the former being enough for prisoners confined for short terms, the latter being required for keeping up the athletic constitution, or that which is capable of great continuous muscular efforts, as in prize-running and other similar feats.

8. Dietaries ought never to be estimated by the rough weight of their constituents, without distinct reference to the real nutriment in these, as determined by physiological and chemical inquiry.

Keeping these principles in view, and with the help of a simple table, it is not difficult to fix the dietary advisable for any body of men, according to their occupation. It is, also, in general, easy to detect the source of error in unsuccessful dietaries. For example, any scientific person conversant with the present subject could have foretold, as a certain consequence, sooner or later, of their dietary, that the British troops would fall into the calamitous state of health which befell them last winter in the Crimea.

Soldiers in the field will be the more efficient the nearer they are brought to the athletic constitution. But as the demand for protracted, unusual exertion occurs only at intervals, the highly nutritive athletic dietary is not absolutely necessary. On the whole, from experience in the case of other bodies of men somewhat similarly circumstanced, 28 ounces of real nutriment, of which 7 are nitrogenous or reparative, will probably prove the most suitable. Any material reduction below 28 ounces will certainly not answer; and under unusual exertion kept up for days continuously, as in forced marches, or forced siege labour, the quantity should for the time be greater, if possible.

The dietary proposed in the report put before me corresponds very closely, in all respects, with the principles now laid down.

The articles are well chosen. The standard ration contains $20\frac{1}{2}$ ounces of carboniferous, $6\frac{1}{2}$ of nitrogenous, and therefore $26\frac{1}{2}$ of total real nutriment. When biscuit and compressed vegetables are substituted for soft bread and fresh vegetables, the day's ration consists of $19\frac{1}{2}$ carboniferous food, $6\frac{1}{2}$ nitrogenous, and $26\frac{1}{2}$ total.

In both of these scales, the proportion of the two sets of principles is nearly as three to one. In both, the total quantity falls a little short of what appears the most advisable. In all other respects the dietary seems unexceptionably good. It cannot be said that the deficiency will certainly occasion ill health; but there is too little to keep up the strength and energy of the men in circumstances of unusual exertion. The following is an apt illustration:—In the general prison at Perth, the dietary for long terms of imprisonment consists of 19 ounces of carboniferous, and 6 ounces of nitrogenous food; in all, 25 ounces. Now, in the first place, it has been found unsafe to reduce this amount for ordinary sedentary occupations; but, secondly, prisoners under vigorous exercise are found to require a material increase. Some years ago, when I was appointed to inquire into certain points relative to the management of the prison, there were several men employed at the pumps for raising water daily from the Tay for prison use—an occupation

requiring much expenditure of muscular strength. These men were, without exception, compelled to desist when fed on 25 ounces a day. An addition of 8 ounces of meat and 6 ounces of bread was found necessary, and then they all worked vigorously and cheerfully. This raised their allowances to $23\frac{1}{2}$ ounces of carboniferous, and $8\frac{1}{2}$ of nitrogenous food, or 32 ounces in all.

The standard difficulty in regulating the dietary of soldiers in the field is the present necessity of substituting salt meat for fresh, when it becomes necessary to use only store provisions. The difficulty arises from the known tendency of salt meat to engender disease, or at least to favour its development, and the supposed impossibility of storing effectual substitutes for it. A third difficulty must be here admitted:—Neither by physiological experiment, nor by chemical analysis, is the nutritive value of salt meat scientifically known.

If soldiers could be supplied with what people in civil life know as salt meat, there would be less difficulty; but military authorities ought to disabuse their minds of this very natural comparison. The salt meat for soldiers in the field has always been highly salted, in order to keep for two years or more in every climate. Now, my persuasion is that, apart from the tendency of the protracted use of such food to favour the development of disease, its nutritive value has been much overrated. This may appear evident from the fact stated in the Report, that of a body of men, fed even on rations by no means liberal, few continued to eat a pound of salt meat daily for any length of time. And the science of the question has been sufficiently looked into for an explanation; because meat highly salted must be so thoroughly steeped in cold water, to remove the salt, before it is eatable in large quantity, that much of its most nutritive constituents must be washed out, viz. its albumen, and sapid extract called osmazôme.

Therefore it appears a good suggestion in the Report put before me to deduct four ounces from the ration of salt pork and salt beef, and to substitute half a pint (eight ounces) of peas instead of the four ounces of pork; and, for the four ounces of beef, six ounces of flour, an ounce of currants or raisins, and half an ounce of lard, for making a pudding. Besides qualifying the irksomeness and probable injurious effects of the daily salt meat, this substitution—which will be made chiefly during protracted marches, or other active operations at a distance from head stores, and when more food is needed to meet greater muscular efforts—raises the daily allowances to $23\frac{2}{3}$ ounces of carboniferous, $7\frac{1}{2}$ nitrogenous, and $31\frac{1}{10}$ total nutriment, under the peas ration; and to $24\frac{1}{3}$, 6, and $30\frac{1}{3}$ ounces under the flour-pudding ration. In these estimates, however, the salt meat is assumed to equal fresh meat in nutritiveness—an extremely dubious assumption; but there is no authority by which to fix its true value.

It is much to be desired that a more material reduction of the salt meat could be effected. Nor does this seem impossible. Three substitutes have been proposed: preserved meat, pemmican, and meat-biscuit.

The first of these consists of fresh meat, cooked and preserved hermetically in vacuo in tin cases. At present, a prejudice against it has arisen from the late discovery of abominable frauds in our navy contracts. But this is unreasonable. Such frauds could not have been practised, except under a system of very lax examination on delivery. It is not to be doubted that meat may be preserved in vacuo certainly and securely, and the process is not now very costly. The men would probably object to the frequent use of it, because it falls on the taste; but it would be taken once a-week readily, when fresh provisions are scarce, and even twice a week when no other fresh animal food can be had.

Pemmican is meat thoroughly dried up by a cooking heat, and generally beat up with a proportion of fat. I understand it is said to be objected to on account of manufacturing difficulties, and its tendency to deteriorate in a temperate, and still more in a warm

climate. But in these days of manufacturing ingenuity, one ought to be very slow to admit such an obstacle ; nor can I see where any unconquerable difficulty can lie. Probably it would not be relished continuously by the men, but it would be taken readily as an occasional ration, at all events once a-week ; and I am persuaded that, were the skill of the cook united with the art of the manufacturer, a more palatable article than common pemmican might be produced. It is of moment to consider that, were it found practicable to introduce this as an article of meat rations, a great saving would be effected over fresh meat, salt meat, or preserved meat, in weight, and consequently in transport, for pemmican contains the nutriment of at least three times its weight of fresh meat.

Meat-biscuit—consisting, I believe, generally of the ordinary biscuit materials baked with extract of meat—was tried, as I am aware, by some of our officers in the Crimea. but found to be often spoiled in store or transport. There must have been some palpable error, however, in either its composition or preservation ; at least, a similar article was used successfully by some in the Burmese war. I see no difficulty on the part of a skilled manufacturer in preparing a meat-biscuit with biscuit-flour, dried meat instead of meat-extract (as being both more nutritive and cheaper), fat, salt, and pepper, which, on being thoroughly dried, might be perfectly preserved in tins, and which would constitute a highly nutritive and not unpalatable article of food. It could be easily converted into soup, either alone or with the help of compressed vegetables. It would also be, in its biscuit state—the meat being cooked in the manufacture—a good resource for the men when turned out suddenly in the early morning, and without the opportunity of cooking their breakfast. And, like pemmican, it could be easily transported, as it consists almost entirely of nutriment, with extremely little moisture. Probably the men might not like to use it continuously ; but in urgent circumstances, as on forced marches, it ought to prove of great service ; and in circumstances less urgent it might be made the meat-ration of one day in the week, or possibly even two days.

On the whole, it is very desirable that careful experiments were made as to the preparation and

preservation of pemmican and meat-biscuit. Such experiments ought not to be left entirely to practical men ; scientific knowledge and practical skill should be combined ; otherwise, serious errors may be committed.

In the proposed dietary, no mention is made of cheese among the substitutions for the standard articles. It is excellent, however, theoretically as an occasional substitute for meat, to qualify an otherwise too farinaceous food, because it consists, in a great measure, of an important nitrogenous principle. Then, it has well-ascertained practical advantages. It is not costly ; it is easily preserved for a time ; it is all nutriment, and therefore cheap to transport ; it is relished by all hard-working people ; and there is reason to suppose that it constitutes an effective article of some successful dietaries in civil life.

Peas should be supplied, if possible, in the state of flour, when intended for part of the rations of troops on active service in the field. They are then much more easily cooked, as well as more compactly packed and more easily served out.

When practicable, half a pint of porter (ten ounces) would form a most desirable substitute for the ration of spirits. The nutriment is much the same, viz., one ounce, but the alcohol is only one-half ; and nevertheless, its renovating power is greater. All officers engaged in active service in India, especially during the occasional privations in the late Burmese war, have borne strong testimony to the superior advantages of malt liquor over spirit.

It is difficult to over-value the proposed addition of tea and coffee to the men's rations. They possess a renovating power, in circumstances of unusual fatigue, which is constantly experienced in civil life, and which I have often heard officers, who served in the Spanish campaigns, as well as in the late Burmese war, describe in the strongest terms. This, however, is not all, for it has been recently shown by a very curious physiological inquiry, that both of them, and especially coffee, possess the singular property of diminishing materially the wear and tear of the soft textures of the body in the exercise of its functions in an active occupation.

Edinburgh, 29th December 1855.

APPENDIX XXXIV.

(Furnished by Order of the Secretary of State for War.)

RETURN showing the AMOUNT of CLOTHING and NECESSARIES supplied to the SOLDIER at HOME and ABROAD.

I.—ARTICLES of CLOTHING provided by the PUBLIC for the ARMY.

HOME.		COLONIES.
	<i>Heavy Cavalry.</i>	
1 Helmet every 6th year.	}	The same as at home.
1 Tunic annually.		
1 Pair overalls, ditto.		
	<i>Light Dragoons and Lancers.</i>	
1 Cap every 4 years.	}	Ditto.
1 Tunic annually.		
1 Pair overalls, ditto.		
1 Cap cover biennially.		
	<i>Hussars.</i>	
1 Busby every 4 years.	}	Ditto.
1 Tunic annually.		
1 Pair overalls, ditto.		
1 Cap cover biennially.		
	<i>Royal Horse Artillery and Riding Troop.</i>	
1 Busby quadriennially.	}	Ditto.
1 Dress jacket annually.		
1 Pair overalls, ditto.		
1 Pair boots, ditto.		
1 Pair leather gloves, ditto.		
1 Pair spurs biennially.		

HOME.

- 1 Busby quadriennially.
- 1 Tunic annually.
- 1 Pair trousers, ditto.
- 1 Pair boots, ditto.

Uniform.

- 1 Tunic yearly
- 1 Pair trousers, ditto.
- 1 Busby every 4 years.
- 1 Pair boots yearly.

Working Dress.

- 1 Working jacket yearly.
- 1 Pair do. trousers, ditto.
- 1 Do. do. boots, ditto.

- 1 Bearskin every six years.
- 1 Tunic, annually.
- 1 Waistcoat, ditto.
- 1 Pair trousers, ditto.
- 1 Pair boots, ditto.
- 1 Pair buckskin gloves for sergeants, ditto.
- 1 Sash every 4 years, for Sergeants.

- 1 Tunic annually.
- 1 Pair cloth trousers, ditto.
- 1 Chaco biennially.
- Boots { Sergeants, 2 pairs } annually.
- { Privates, 1 ditto }
- 1 Sash every 4 years, for Sergeants.

Royal Artillery.

When at Ceylon, Hong Kong, Mauritius, St. Helena and West Indies (except Bermuda) :—

- 1 Busby quadriennially.
- 1 Tunic,
- 1 Pair cloth trousers,
- 1 Undress jacket,
- 2 Pair serge trousers,
- 1 Pair boots, annually.

} biennially.

In the years in which the tunic is not issued compensation in money is granted to each man, to be expended by the Officer commanding for the benefit of the Soldier in articles best suited to the climate.

Gun Lascars.

- 1 Cap biennially.
- 1 Tunic, ditto.
- 1 Pair cloth trousers, ditto.
- 1 Undress jacket, ditto.
- 2 Pair serge trousers, ditto.
- A money allowance in lieu of boots, annually.

Royal Engineers.

When at Ceylon, Hong Kong, Mauritius, St. Helena, West Indies (Bermuda excepted), the uniform clothing and boots are issued as at other stations.

The boots belonging to the working dress are issued yearly as at other stations.

The working dress is issued biennially, and in the year in which it is not issued compensation in money is granted to each man to be expended in articles best suited to the climate.

*Foot Guards.**Regiments of Foot.*

When serving at Gibraltar, Mediterranean, North America, Bermuda, Cape of Good Hope, New Holland, and Van Diemen's Land, the same clothing is supplied.

When in the East Indies, Ceylon, St. Helena, Mauritius, and Hong Kong the clothing issued is as follows :—

- 1 Chaco biennially.
- 1 Tunic, ditto
- 1 Shell jacket biennially in the year in which Tunics are not supplied.
- 1 Pair cloth trousers yearly.
- 1 Pair boots, ditto.
- 1 Sash for Sergeants every 4 years.

A money allowance is granted to each man at these Stations for the difference between the value of the tunic and shell jacket in the year in which the former is not issued, to be expended in articles of clothing best adapted to the climate.

When serving in the West Indies (except Bermuda) the following clothing is issued :—

- 1 Chaco biennially.
- 1 Tunic annually.
- 1 Pair serge trousers annually.
- Boots—Sergeants, 2 pairs annually.
- Other ranks 1 pair, ditto.
- Cotton socks—Sergeants 3 pairs annually.
- Other ranks 2 pairs, ditto.

HOME.

COLONIES.

Highland Regiments—Wearing the Kilt.

- 1 Coat annually.
- 1 Waistcoat with sleeves annually.
- 1 Pair shoes, ditto.
- 15s. 6d. for each sergeant, and 8s. 6d. for each private towards the provision of Highland articles annually.

Highland Regiments abroad receive the same clothing as they do at home, except when stationed in the East Indies, Ceylon, Mauritius, or St. Helena, in which cases the coat is supplied biennially, and in the alternate years the Soldier receives its value in money.

Highland Regiments—Wearing Trews.

- 1 Coat annually.
- 1 Waistcoat with sleeves, ditto.
- 1 Pair boots, ditto.
- 13s. 6d. for each sergeant, and 6s. 6d. for each private towards the provision of Highland articles annually.

Ditto.

MEM.—This money allowance is about to be done away, and the articles of Highland equipment supplied in kind.

Ceylon Rifle Regiment.

- 1 Chaco for European N. C. officers and Malay companies biennially.
- 1 Dress jacket
- 1 Undress jacket
- 1 Pair trousers
- 1 Undress jacket
- 1 Dress jacket
- 1 Pair trousers

} for European } annually.
N. C. officers }

} for Native N. C. } biennially at
officers and men } Ceylon,
annually at
Hong Kong.

12s. in money to each sergeant, and 8s. to each soldier of other ranks, annually in lieu of boots.

Cape Mounted Rifles.

- 1 Chaco and cover biennially.
- 1 Tunic, ditto.
- 1 Stable jacket, ditto.
- 1 Flannel waistcoat, ditto.
- 2 Pairs gloves, ditto.
- 1 Pair boots and spurs, ditto.
- 1 Pair overalls annually.

West India Regiments.

- 1 Fez and 2 turban cloths biennially.
- 1 Jacket annually.
- 1 Waistcoat, ditto.
- 1 Pair Turkish trousers, ditto.
- 1 Pair leather leggings biennially.
- 1 Pair sandals annually.

MEM.—This is the new dress to be adopted for the future.

Royal Malta Fencibles.

- 1 Chaco triennially.
- 1 Tunic every 18 months
- 1 Pair cloth trousers, ditto.
- A money allowance in lieu of boots, ditto.
- Sashes every four years.

Hospital Corps.

- 1 Cap every two years.
- 1 Tunic yearly.
- 1 Pair trousers, ditto.
- 1 Pair boots, ditto, (2 for sergeants).

} The same clothing as at home.

Military Train.

- 1 Cap every four years.
- 1 Tunic annually.
- 1 Pair overalls, ditto.

} The same clothing as at home.

HOME.

COLONIES.

Royal Artillery—continued.

- 3 Cotton shirts and 2 flannel.
- 1 Sponge.
- 1 Stock.
- 3 Pair wool stockings.
- 1 Button stick.
- Straps, { 1 Canteen.
- { 1 Great coat.
- 2 Towels.

The same as at home.

Royal Engineers.

APPENDIX XXXVIII.

EXTRACT from the " ORDERS and REGULATIONS for the Guidance of the Corps of Royal Engineers and Royal Sappers and Miners at home and abroad, revised by Order of the Master-General and Board of Ordnance to 1st January 1851."

The following is to be the calculation of cubical space, viz. :—
400 to 500 cubic feet per man in barracks in temperate climates,
600 to 700 " " hospitals " "
480 to 600 " " barracks in tropical climates
700 to 900 " " hospitals " "

and in general the maximum space is to be allowed, and for single bedsteads.

APPENDIX XXXIX.

(Prepared by the Secretary.)

THE following queries were addressed to medical officers of the ten principal metropolitan hospitals, to the resident medical officers of twenty provincial hospitals and infirmaries, to the principal medical officers of five naval and marine hospitals, and to the medical officers in charge of the troops at forty-six military stations throughout the United Kingdom.

duced to a tabular form in the following Statement :—

I.

Metropolitan Hospitals.	What is the width of the beds?	What is the distance between the sides of the adjoining beds?	What is the distance from foot to foot between the opposite beds?	What is the cubic space allowed for each patient in the wards?
	ft. in.	ft. in.	ft. in.	ft.

5. Are any special means of ventilation used in the wards? If so, what are they, and what in your opinion is their practical value?

means the wards are kept pure and sweet at all hours of the day and night.

(Signed) ROBT. HILL,
House Governor.

I. METROPOLITAN HOSPITALS.

Westminster.—The special means of ventilation at this hospital are, in my opinion, of the greatest practical value and efficiency. In the ceiling of each ward are two ornamental circular openings, leading to two air shafts, placed on each side of the smoke flue or chimney. The skirting board of the ward, a few inches above the floor, communicates by several openings with the external air; by means of slides these openings can be closed or otherwise, at pleasure; by this arrangement a constant upward current without draught is established. The air of the wards is thus always pure, and night and day equally sweet and free from all smell and closeness. As a further means of securing a constant upward current through every part of the hospital, at each wing of the building are two well staircases, at the base of which the air enters a perforated opening and passes over some hundred feet of hot water pipe; and as all the air entering the basement must pass over the coils, a steady upward current is secured, which ventilates the corridors and passages leading to the wards. I have no hesitation in expressing my opinion that there is not a building in the country so perfectly ventilated as the Westminster hospital.

(Signed) W. R. BASHAM,
Senior physician to the Westminster hospital.

St. Mary's.—The hospital is ventilated by means of a fresh air and a foul air shaft. The fresh air is passed into the wards through channels or flues built in the walls, which flues are supplied with fresh air entering the fresh air shaft, at the basement of the building. The foul air is extracted, or passed off from the wards, through a shaft in the ceiling of each ward, which empties itself into the foul air shaft, and is then extracted by means of suction power created by a furnace and shaft, the latter rising about 25 feet above the height of the building. This plan of ventilation is found to answer exceedingly well, and if properly carried out is of great practical value.

(Signed) EDMD. THOS. TILLARD,
Steward.

King's College.—No special means. There are opposite windows in the breadth and in the length of the wards. On the subject of ventilation it may be well to state, that the medical officers of King's College Hospital were from the first, to a man, opposed to artificial ventilation; they recommended ventilation only by open windows and fireplace. As the walls of the hospital are of some thickness, and the windows of the wards are glazed with plate glass, an open fireplace of moderate size suffices to warm a ward of the following dimensions:— $70 \times 24 \times 16$, or $70 \times 24 \times 15$, or $70 \times 24 \times 14$. All the windows are made to open, and ventilation can be effected either across the ward, or from end to end.

(Signed) WILLIAM A. GUY, M.B.

University College.—Ordinary windows on both sides, within six inches of the ceiling, and opposite to each other. A shaft by the side of the ward flues, with an opening near the ceiling. Cold air is introduced through perforated zinc in the skirting boards.

E. A. PARKES,
Physician to the hospital.

Royal Free.—About sixteen windows; each opening to allow a current of entry below, of exit above, by graduated adjustment. Two open fires and two doors aid these.

(Signed) WILLIAM BRINTON, M.D.

London.—There are ventilators in the ceilings, many windows, and good fireplaces; by these simple

Guy's.—There are two methods of ventilation employed, pertaining respectively to the old and new departments of the hospital. That in use in the old hospital may be termed the natural method, and consists simply in the free admission of air by doors and windows, facilitated to a certain extent by the peculiar construction of the windows, the upper sashes of which move on a central pivot, and are made to open outwards and inwards. In addition to this, two of the upper frames in the upper sash of each window are partially detached from the ordinary framework of the window, and are constructed so as to form a kind of hopper mouthed ventilator, through which a constant and almost imperceptible current of air is transmitted to the wards. These ventilators are closed in the winter, and kept open during the summer months. In many of the wards there are also circular openings in the ceilings, placed immediately over the gaslights, which communicate with the external air by means of open channels between the joists. These are also closed in winter and opened in summer.

The other method, namely, that in operation in the new hospital, is of a more complicated character, the construction of the building having been made subservient, to a certain extent, to meet its requirements. It consists in the admission of a descending current of fresh air, by means of a single shaft or tower, communicating with an extensive chamber in the basement of the building, into which the external air enters freely, and during the winter season gets heated by passing over a series of hot-water pipes. From this chamber it is carried by numerous flues into the various wards and apartments of the hospital. The foul air is withdrawn through numerous gratings in the walls into a taller shaft, which also answers the purpose of the main chimney, the smoke flues of the building being connected with it. To produce a good ascending current of air, and a consequent sufficient amount of suction power, a fire is kept constantly burning in the basement of the high shaft, which serves the double purpose of rarefying the air and of heating water for the supply of the hospital. By these means, combined with the ordinary ward fires, an equable temperature may be sustained night and day during the winter season, and a constant change in the ward atmosphere is obtainable without recourse being had to open windows. It is, however, often necessary, especially in warm weather, to open the ward windows, to obtain a more abundant supply of fresh air. The wards thus ventilated contain each four rows of beds, within two outside walls, divided in the centre by an intervening wall, in which extensive openings are made to admit of free communication from one side to the other.

On the whole I am inclined to think, after considerable experience of both systems, that for general hospital purposes the method first mentioned is the best, provided there are a sufficient number of fireplaces and an ample allowance of space is reserved for each patient, but it is a question whether the second method would not prove equally if not more efficacious in a building constructed to admit of not more than two rows of beds within two outside walls, and wherein the windows could be opened freely during the summer months.

JOHN CHAS. STEELE, M.D.,
Superintendent.

St. Thomas'.—Open windows and fires. In the ceilings are openings with flues running up to the top of the building to let out the foul air at night; all other methods of ventilation are of no practical use. I have spent much time on the continent visiting the hospitals, and have carefully inspected the modern artificial methods adopted, particularly at the new

hospital in Paris, La Riboisière; and I have come to the conclusion, that there is very little *practical* benefit derived, quite inadequate to the enormous expenditure. Windows to pull down from the top, with a little protection in front, to prevent the downward current on the patients' heads, the windows so arranged that no bed stands under them, good open fireplaces, with perhaps for night, as we have, openings in the ceiling, with a shaft from them running up to the top of the building by the side of the chimney flue, and either by gratings over the doors, or some other more appropriate apertures, to admit fresh air from the staircase, &c., so as not only to facilitate the escape, but to force out the foul air, are much the best means of ventilation.

(Signed) R. G. WHITFIELD,
Resident Medical Officer.

St. Bartholomew's.—There are no special means of ventilation. The windows are numerous and large, and there is a spacious fireplace and wide chimney.

(Signed) W. BALY, M.D.

St. George's.—In a few of the wards the foul air passes out by openings near the roof, into a descending flue leading to a furnace in the kitchen. In some of the others, valves open from the wards into ascending shafts, leading into the roof; pure air being admitted by a shaft from the roof, which is first brought down to the basement of the hospital. In others the ventilation is by Arnott's valves in the chimney flues. All these plans are of service in cold weather, when the windows cannot be opened; perhaps the method with the ascending shafts into the roof is the most effectual.

(Signed) THOMAS HOLMES,
Assistant Secretary.

Middlesex.—The form in which the hospital is constructed has much to do with its ventilation. It consists of two parallel wings, connected by a curtain running crosswise near their centres, in the form of a letter H. The wards are almost wholly situated in the former, the corridors and passages chiefly, and the officers' rooms wholly, in the latter, which has a garden on its N.W., and a large court on its S.E. aspect. The spaces external to the wards bear a large proportion to the wards themselves, and communicate freely with the open air. The passages between the wards have large openings in their inner walls, each opening being over against a window—an arrangement which effectually prevents the accumulation of foul air outside the wards, or the transmission of foul air from one ward to another.

For the ventilation of the wards themselves, both *natural* and *artificial* means are employed.

Besides *end* windows, of which almost all the wards have one or more, each ward is furnished with from *three* to *six* opposite windows. Each window consists of three separate sashes, each of which moves on two lateral pivots at its *lower* angle. They are connected, and open diagonally inwards, by means of a vertical iron rod attached at their upper borders, and furnished at bottom with a horizontal handle. This handle revolves on a semi-circular iron plate, so graduated that the sashes can be fixed at various angles, and kept open from 2 to 8 inches apart. The result of this arrangement is most important; for, whilst air can be admitted to any amount, the current passes upward, and there is no down draught. The flame of a candle held at the level of the first opening is not turned, while immediately above there is a powerful current. The walls, being coated with Parian cement on their inner surface, are non-absorbing, and are furnished, at the ceiling level and at given distances, with openings to the external air, fitted with perforated zinc plates, which can be opened or closed at pleasure.

In all the back wards of the east wing, a subsidiary *artificial* ventilation is carried on by means of a flue from the furnace of a steam-boiler of seven horse power, and the furnace of the laundry drying closet, conjointly uniting in the basement, and running up the whole height of the wing. Outside the flue there is a chamber, the air of which is, of course, always heated or rarefied. By means of an opening into this chamber, at the distance of half a foot from the ceiling of each ward, a suction-power is maintained towards the heated flue, which, it is computed, extracts ten thousand feet of impure air per minute from each of the four wards. The same plan is carried out in the west wing by means of a coke furnace.

It is important, however, to notice, that there is no perceptible difference in the purity of the air, and the salubrity of the wards thus ventilated, and of those where no such artificial means are employed.

(Signed) ALEX. SHEDDEN,
Secretary.

II. PROVINCIAL HOSPITALS.

Brighton.—A large shaft 60 to 70 feet in the rear of the hospital, carried underground to the basement, there communicates with pipes which carry fresh air to every ward, opening by gratings, which can be closed, just inside the doors. There are also gratings fixed in the wall below each window, which likewise open into the interior of the wards by a ventilator, which can be opened or closed at pleasure. And there are again ventilators at the top of the wall close to the ceiling, made to open or close according to the temperature required. These are found to answer very well.

(Signed) FRED. TOWERS,
House Surgeon.

Chichester.—Perforated zinc plates in the ceiling, opened and closed at pleasure; also in upper part of door, covered in front by an oblique panel of wood, open at top. These answer very well.

(Signed) EDWARD H. MAY,
House Surgeon.

Winchester.—None. Our long narrow wards with windows on opposite sides, are found to be ventilated better than our square ones, with windows on two adjoining sides.

(Signed) E. A. JACOB.

Bristol.—No special means for ventilation, except in one or two wards where a shaft is carried up into the roof of the house. The wards are furnished with windows which open into corridors running the whole length of the house. These corridors have free communication with the external air, both centrally and laterally. A thorough free circulation is thus sustained through them, and the ward windows are able to be open into these corridors night and day, in addition to the windows communicating directly with the external air, which are opened according to the direction of the wind, &c. By these means a very satisfactory state of ventilation is kept up.

(Signed) NATHANIEL CRISP,
House Surgeon.

York.—Yes, Dr. Arnott's hydraulic machine. Value very considerable, especially in combination with *ordinary* means of ventilation.

(Signed) A. J. HANBURY,
House Surgeon.

Nottingham.—There is an opening in the centre of each ceiling, communicating with an air flue formed between the ceiling and floor above, and which flue terminates in a furnace, the fire in which is supplied with no air except that which is drawn through the

ceilings. The furnace is thus constantly drawing over the impure air from the upper part of the wards and seems to answer its purpose. There is no special provision for the entrance of air into the wards, except doors and windows.

(Signed) JOSEPH WHITE.

Manchester.—A plan adopted by the committee which answers very well. The windows are made to open at the top; the space between the window and the ceiling is boxed off to within an inch or two inches of the latter. Then there are two or more openings, about 30 inches diameter, made in the middle of the room, communicating by a shaft with the roof, and at the bottom of the shaft is a common tin fan, worked by the current of foul air constantly passing through; the greater the draught of air the greater the velocity of the fan; thus it can always be discovered whether change of air is going on.

(Signed) J. WOODWARD.

Leeds.—Large open fireplaces, air grates, and circular doors in partition walls.

Sheffield.—Doors, fire-place, windows, and a flue in the centre of the ceiling are the only means of ventilation.

(Signed) JOHN HALL,
H.S.

Birmingham.—There is a shaft connected with a stove, and an opening from this shaft is made into each ward; the fire being lighted underneath the shaft, the heated air draws a certain portion of foul air up with it to the upper opening in the roof. But I do not think the arrangement satisfactory.

(Signed) W. HAMILTON ROE.

Derby.—Openings at the top of the wards communicating with air flues, which terminate in a cupola at the top of the building. Perforated zinc at the upper row of panes of each window. Ventilation good.

(Signed) A. H. DOLMAN.

Norwich.—No.

(Signed) JOHN SKAIFE,
House Surgeon.

Newcastle-upon-Tyne.—In each of the three flats of the new addition there are two large wards, 111' 0" long, 24' 0" wide, averaging 14' 6" in height, communicating with each other by arched openings at each end, and having four semi-circular openings near the ceilings in the walls between the two wards. The two wards are heated by four open fire-places, placed back to back, with an iron box between them, and there are vents from the boxes to the wards below, for the purpose of extracting the impure air, regulated by ventilators, and vents carried up from the boxes to the apex of the roof, thereby producing most powerful exhausters. The atmosphere is admitted in fine weather by the windows, they having three heights of sashes hung on pivots; and in stormy weather the air is conveyed from the exterior to the table legs, which are made of perforated cast-iron. The above plan of ventilation is most perfect, and has given the greatest satisfaction.

(Signed) ANDREW BOLTON,
House Surgeon.

Glasgow.—By a contrivance at the top of the window by which the current is directed to the ceiling; by perforated glass; by openings in floor and ceiling; by ventilating shaft. The mode of ventilating patented by McKinnell is the best, most of the other plans are mere makeshifts.

(Signed) JAMES MC GHEE, M.D.

Aberdeen.—Many of the wards have windows on both sides. Openings of considerable size are placed near the ceilings of the wards into the common passages, and from these communications are made into pretty wide funnels, which ascend through the roof of the building.

(Signed) ROBERT RATTRAY, M.D.,
Superintendent, Aberdeen Infirmary.

Edinburgh.—By flues for admission and exit of air. In one part (the new surgical house) by Haden's apparatus.

(Signed) ALEXANDER MC DOUGALL,
Treasurer Superintendent.

III. ROYAL NAVAL AND ROYAL MARINE HOSPITALS.

Haslar.—Four ventilators near the ceiling leading to the external air, two opening into chimney, one of them receiving the products of a gas burner. Two ventilating panes for admission of air in each ward.

(Signed) ALEX. NISBET, I. H.

I would add on the subject of ventilation that each ward has windows on each side; the defect in the building of Haslar hospital is, the wards on the upper floor not being equal in height to the lower and first.

(Signed) J. C. DACRES,
Captain-Superintendent.

Plymouth.—Each ward has a glass louver in place of a pane of glass in one of the sashes, of no valve as a means of ventilation.

(Signed) E. HILDITCH,
Inspector of Hospitals.

Cork.—No special means of ventilation.

(Signed) J. L. TROUSDEL, M.D.,
Assistant-Surgeon, in absence of Surgeon.

Woolwich.—Two ventilating panes in each ward. Four ventilating windows, three feet square, hung on central pivots, and opening into the main corridor. Quite sufficient during the day when all the doors are open, but insufficient at night, during the summer especially.

(Signed) OLIVER EVANS, M.D.,
Deputy-Inspector of Hospitals.

Chatham.—Four ventilators in the ceiling of each ward, which communicate with the exterior of the wall, through the joists of the floor above. This plan answers very well, but will be further improved by valves placed so as to prevent the ingress of the external air in boisterous weather.

(Signed) JOHN DRUMMOND,
Deputy-Inspector of Hospitals.

IV. MILITARY HOSPITALS.

Fort-George.—A perforated metallic plate is placed in lieu of a pane of glass in several of the windows of the hospital. The amount of ventilation by this means does not admit of regulation.

(Signed) G. C. MEIKLEHAM,
2nd Class Staff-Surgeon.

Stirling.—None. The best that I know for the purpose are the windows in the Middlesex hospital, London.

(Signed) G. K. HARDIE, M.D.,
Staff Assistant-Surgeon.

Glasgow.—Six ventilators in the ceiling of each ward.

(Signed) E. W. MANDEVILLE,
Surgeon, Depôt Battalion.

Edinburgh Castle.—Ventilators in ceilings of wards connected by means of a box-shaft with the external part of the building. Not good.

(Signed) JOHN G. WOOD, M.D.
Staff-Surgeon, 1st class.

Piershill.—Ventilators are placed under the floor and along the upper part of the wall between the windows, eight in each ward. Imperfect.

(Signed) W. CATTELL,
Assistant-Surgeon, 5th Dr.-Gds.

Preston.—In addition to the door and two or four windows and chimney in each ward, there are two iron ventilators in the ceiling of each ward, which, when opened, allow the foul and heated air to escape externally. The air in this hospital is always pure, and I believe that the ventilators are useful.

(Signed) G. F. BONE, M.D.,
Staff Surgeon, and Surgeon Depôt Batt.

Manchester.—None; the ventilation being from the windows.

(Signed) G. DOLMAGE,
Surgeon 7th Dragoon Guards.

Birmingham.—In one ward there are three, in each of the other wards there are two ventilators about 9 inches from the ceiling, communicating in a slanting direction downwards directly with the open air, with one exception—size, $10\frac{1}{2} \times 5\frac{1}{2}$ inches, and furnished with a spring trap-door, which can be opened or closed at will. These are found of considerable practical value.

(Signed) H. FRASER, M.D.
Surgeon, 10th Hussars.

Norwich.—No special means of ventilation are used, though greatly required. Much improvement is needed in this respect.

(Signed) THOS. W. CROSSE, Surgeon,
Medical Officer in charge.

Woolwich.—Ventilation is caused by means of large moveable fan lights over the door of each ward, which is opposite to the window, for the escape of foul air, while at the bottom of the door is a slit for the admission of fresh air, which with the addition of the open fireplace in each room, and the common small circular moveable ventilators placed in the walls, are in my opinion very beneficial in ridding the wards of foul air and supplying them with fresh.

(Signed) JOHN W. HALAHAN,
Deputy Inspector-General,
Principal Medical Officer.

Sheerness.—The wards now occupied temporarily by the sick are a certain number of rooms of the old barrack, in which there is no special means of ventilation in use.

(Signed) STANHOPE H. FASSON, M.D.
Surgeon, Royal Artillery.

Chatham Garrison.—In the large wards there are two openings communicating with the open air, and two with the corridors, each 9 inches square, placed near the ceiling. In the smaller wards there are two openings only 9 inches square, one near the ceiling, and the other near the foot of the chimney. In No. 2 hospital the ventilation is from four circular openings in the ceiling, and a thorough draught of air between the floor of each room and the ceiling of the room below it. I consider the ventilation of many of the wards of No. 1 hospital imperfect as there are no special means of admitting air; and the whole of the

wards of No. 2 hospital have too great an ingress of air without the means of being moderated at the discretion of the medical officer.

(Signed) A. MACLEAN,
Surgeon, Provisional Battalion.

Chatham, Fort Pitt.—The ceilings of the large wards present four rows of circular perforated pieces of wood, which correspond with an equal number of square metal perforated plates inserted in the outer ward. Viewed as a special means of ventilation, the arrangement is primitive, and very ineffective.

(Signed) J. R. TAYLOR,
Deputy-Inspector-General.

Chatham, Brompton.—No special means of ventilation.

(Signed) HENRY BRISCOE, M.D.
Surgeon, Royal Artillery.

Walmer.—No special means of ventilation. There are several large windows in each ward.

(Signed) ALEXANDER GIBB, M.D.
Surgeon, Depôt Battalion.

Dover.—Perforated plates in the ceiling, communicating by a flue with the open air through another perforated plate. I consider them very efficacious.

(Signed) J. SHELDON FURLONG,
Surgeon, 42d Royal Highlanders.

Brighton.—There are three circular plates, two feet in diameter, in the ceiling of the two lower wards, and perforated by 20 small holes. In the upper wards there are two plates of the above size, and two smaller ones. For the purposes of ventilation they are next to useless.

(Signed) H. KENDALL, M.D.
Surgeon, 4th Lt. Dragoons.

Chichester.—No special means, unless some perforations in the ceiling constructed for the escape of smoke, &c., from lamps when used, may be so considered.

(Signed) E. B. TUSON,
2d Staff Surgeon.

Winchester.—1st. Moore's patent ventilator in every window. 2d. Gratings near the floor under every window. 3d. Two ventilators near the ceiling in every ward, communicating with distant flues in chimney stack. 4th. Moveable fanlight over each ward door.

(Signed) W. BARRETT, M.B.,
Staff Surgeon, 2d class.

Portsmouth.—Tubular ventilation regulated by valvular gratings. They act efficiently when properly attended to.

(Signed) WM. BELL, M.A.
Deputy-Inspector-General
of hospitals.

Parkhurst.—Two small openings nearly on a level with the floor at each end of the apartment, with a sliding shutter, so as to open and close at pleasure; and in the ceilings there are small openings fitted in like manner with sliding shutters and communicating with tubes which pass into the roof of the building. Practical value very good.

(Signed) I. T. O. JOHNSTON, M.D.
Surgeon, Depôt Batt.

Plymouth.—There are no special means in use. Our ventilation is very good; there are eight large windows in each ward, all opening into the outer air, a very large fire-place, and two doors opening into the stairs passage.

(Signed) C. C. I. DELMEGE, M.D.
Staff-Surgeon.

Pembroke.—No. (Signed) WILLIAM F. T. IVEY.

Hounslow.—Yes. Sliding ventilators from without, admitting fresh air, and circular ventilators in each ceiling, to carry off the impure air—which answers well.

(Signed) J. B. ST. C. CROSSE,
Surgeon, 11th Hussars.

Canterbury.—The wards are ventilated through apertures in the ceiling, opening into large horizontal shafts which communicate with the external air through the sides of the building. They appear to answer very well. The upper portion of the windows likewise moves inwards on the segment of a circle, which is a valuable addition in the ventilation of the wards in hot weather.

(Signed) H. H. MASSY, M.D.
Surgeon, 2d Dragoon Guards.

Nottingham.—The wards are ventilated by the windows and openings in the ceiling capable of being closed by slides, and which communicate through the space below the roof with the passage; they answer well when the window in the passage is open.

(Signed) NATHANAEL P. BETTS,
Assistant-Surgeon R.A.

Athlone.—None.

(Signed) S. M^cV. LLOYD, M.D.
Staff-Surgeon, 2nd class, Dépôt Battalion.

Birr.—None except the ordinary means by windows and chimney flues.

(Signed) R. R. DOWSE,
Staff-Surgeon, 2nd class.

Cork.—Nothing special.

(Signed) J. JACKSON,
Staff-Surgeon, 2nd class.

Dundalk.—No special means of ventilation; the wards have never been full since the arrival of the regiment in the barrack, May 1856.

(Signed) A. P. LOCKWOOD,
Surgeon, 8th Hussars.

Limerick.—The large wards are sufficiently ventilated by the several windows; small wards, a small window above the entrance, which answers for the use intended.

(Signed) J. MOSTYN,
2d Staff Surgeon.

Templemore.—There are no special means used in the wards of the hospital, but the ordinary ventilation is good.

(Signed) M. F. MANIFOLD,
Staff Surgeon, 2d Class.

Belfast.—There is a perforated iron plate one foot square in the centre of each ceiling, and iron gratings communicating with the external air between the floorings and ceilings. Without a forcing pump or draught pipe to cause a current, the ventilation cannot be perfect. The close smell still perceptible in the wards at night indicates imperfect ventilation.

(Signed) EDWARD W. BAWTREE, M.D.
Staff Surgeon, 2d Class.

Newbridge.—None but a sort of overlapping pane in most of the windows, admitting a slight draught of air. Undoubtedly of very little benefit, but better than nothing.

(Signed) W. ORD MACKENZIE, M.D.
Surgeon, 3rd Light Dragoons.

Kilkenny.—No special means except by opening the windows.

(Signed) WM. KER PARK,
Surgeon, 16th Lancers.

Fermoy.—Iron gratings in external walls, opening beneath flooring in lower ward. In upper wards, perforated iron plates over doors.

(Signed) W. M. DOWDING,
Staff Surgeon, 2nd Class.

Cahir.—There are no special means of ventilation in the wards. The only ventilation being through the upper part of the windows.

(Signed) A. KNOX RICKARDS,
Assistant-Surgeon, 16th Lancers.

Dublin General Hospital, Phoenix Park.—The only ventilators are in the fever wards, three in the roof of each; they are beneficial as purifying the air in the wards.

(Signed) F. R. WARING,
Staff Surgeon, 2nd Class.

Dublin, Arbor Hill.—One perforated glass ventilator, and one valvular iron ventilator in each ward; I consider them of considerable value.

(Signed) A. FORTEATH, M.D.,
Surgeon, Royal Dragoons.

Dublin, Ship Street.—The special means of ventilation are an opening over door, which may be closed at pleasure by a glass window hung on a pivot, an opening about 18 inches by 6, near ceiling, and communicating with chimney. These means of ventilation, I think, are of great value in the winter season.

(Signed) J. CRRERAR,
Surgeon, 50th Regiment.

Dublin, Beggar's Bush.—None.

(Signed) J. EWING,
Surgeon, 95th Regiment.

Dublin, Richmond Barracks.—In the two smaller wards perforated panes in the windows, and valvular openings into the chimney. In the small wards the ventilation is bad.

(Signed) THOMAS GEO. MURPHY,
Assistant-Surgeon in charge, 60th Rifles,
3rd Battalion.

Dublin, Pigeon House Fort.—No special means of ventilation.

(Signed) A. HAWKINS,
Assistant-Surgeon, Ordnance.

Dublin, Portobello.—By means of windows, which have perforated panes of glass, and also by the patent ventilators opening into the chimney. Neither the perforated panes nor the ventilators are, in my opinion, equal to a small portion of the windows being left open.

(Signed) J. W. C. ATKINS DAVIS,
Senior Surgeon, Royal Artillery.

No replies were received from The Royal Infirmary, Liverpool; The Northern Hospital, Liverpool; The County Hospital, Canterbury; The Devon and Exeter Hospital, Exeter.

APPENDIX XL.

EXTRACTS from the REPORT of the DEPUTATION of the BUILDING COMMITTEE of the NEWCASTLE-UPON-TYNE INFIRMARY, being the Result of their Inspection of several of the London and Provincial Hospitals.

* * * * *

We think it preferable that our report should be principally confined to those important subjects which pertain more particularly to the *construction, general arrangement, methods of ventilation, heating and cleansing* of the interior of the hospitals we visited.

* * * * *

Observations arranged under distinct heads.

We found that all the hospitals we inspected have been enlarged, or remodelled within the last few years, and that they consequently abound in the latest improvements. As every large hospital can be naturally divided into distinct departments, we have classified our observations, and arranged them under distinct heads, for the purpose of simplifying the report.

Position and form of hospitals.

With regard to the *position* and *form* of hospitals, we have, upon the whole, seen none situated in a more open and healthy position than our own. The general form is that of a quadrangle, with one side wanting; the wings extend backwards from the extremities of the front, and enclose a court yard, thus  as in the Manchester Hospital, the Queen's and General Hospitals, Birmingham, and London Hospital. This court-yard is sometimes laid out as a garden, after the manner of London Hospital and Middlesex Hospital. Another common form is a central building, having wings extending across each end, giving it the general form of the letter H, as in the Southern District Hospital, Liverpool, St. George's Hospital, and Middlesex Hospital.

Porters' lodges and entrances of hospitals.

Several hospitals have a *porter's lodge* at the outer gate of the hospital grounds. As a rule, there is always one *principal* or *general entrance* into the building, another for the use of *out-door patients*, and generally *one more* at the back of the institution, which communicates with the kitchens and cellars. The last is principally used for the admission of food, fuel, and stores. All hospitals have a *porter's room* at the general entrance, with a resident porter constantly on the spot. Several have another porter stationed at the out-door patients' entrance, and also sometimes at that leading to the kitchens and store rooms.

Accident reception room.

All the hospitals we visited have a suitable *room* for the *reception of accidents*. It is furnished with the necessary accommodations and appliances for such cases, and is generally situated immediately adjoining to the general entrance. It is under the control of the porter who is located there, and from its position, at the entrance of the hospital, it is easy of access, and is at the same time neither a source of annoyance nor alarm to the inmates lodged in the interior of the building. The situation and internal arrangements of the accident rooms in the Manchester Hospital and the London Hospital are very admirable.

Official rooms and apartments.

The *official room* and *apartments* are all usually placed near to the general entrance. They comprise the *board room, secretaries or visitors' waiting room, library, museum, chapel, out-door and house pupils', house surgeons', and matrons' rooms*. They are generally very commodious, and the internal arrangements very complete. It is an advantage when the matron's room is near to the kitchens and store rooms, and her dormitory in connexion with those of the domestic servants. A similar connexion between the house surgeons' and house pupils' rooms is desirable; and the sleeping apartments of the officers always adjoin those used as their sitting rooms.

Out-door patients' department.

The *out-door patients' department*, consisting of the *waiting and medical and surgical examination rooms*, together with the *dispensary, laboratory*, and convenient *store rooms* in connexion with them, are all isolated as much as possible from the wards and the interior of the building. This is necessary for the maintenance of order and cleanliness within the hospital. There is accordingly a *special entrance*

for the out-patients, which prevents them from passing into the interior of the building, with *baths* and other conveniences for their special use. A small *private examination room* is attached to the physicians' and surgeons' rooms, and is so necessary as to be considered indispensable. The *waiting rooms* are always commodious, and the arrangement, ventilation, and heating of those in the Manchester Hospital and London Hospital, where the out-patients' department is on a very extensive scale, are very superior. The *dispensary* is in connexion with the waiting rooms, and the window from which medicine is distributed, is generally protected by a *partition*. This isolates patients receiving medicine, and enables the dispenser to give private directions to each one, without the other patients overhearing anything that might be offensive. This is very worthy of imitation. The internal arrangements of the dispensary are capable of being made so neat, compact, and convenient, as greatly to facilitate the dispensing operations. The *laboratory* for the compounding and preparation of crude drugs, together with the surrounding *store rooms*, are generally very commodious, with superior internal arrangements. In the Manchester Hospital the steam from the boiler is most advantageously employed for making the infusions and decoctions, and for many other purposes. The basement story of one of the wings of the London Hospital, St. Thomas's Hospital, and St. George's Hospital is appropriated for the use of the out-door patients, and appeared to us very convenient and well adapted for this department. This arrangement also completely shuts the out-patients from the interior of the hospital, and localises, at a distance from the in-door patients, the noise and dirt arising from this source.

In the general arrangement of the *stairs, corridors, wards, nurses' rooms, sculleries, baths, water-closets, and operation rooms*, there is great variety. In the older hospitals the arrangement is like to that of the Newcastle Infirmary. The stairs lead to long corridors, from which separate doors open into the wards (which are generally small), as well as into the nurses' room, sculleries, &c. Each one has, accordingly, no connexion with the other, as may be seen in the construction of our own infirmary.

* * * * *

Of late, however, a much more healthy, compact, and convenient arrangement has been introduced into hospitals. The wards are large, and are entered by a door close to the stairs, there being no great length of corridor. Each ward has one or two nurses' rooms, with a bath, water closet, and scullery, situated either in the interior of the ward, or overlooking, and opening into it by one of its doors. This modern and superior arrangement of the wards and the other necessary rooms, [has been adopted in the beautiful new wing of St. Thomas's Hospital, London.]

* * * * *

The wing of our infirmary is cut up into many small and confined rooms, whilst the modern hospital is constructed on a totally different principle. In the latter, the nurses' and other rooms are seen to be appendages to the large ward, which extends from end to end of the wing, and is capable of being ventilated by currents of fresh air from all points. In addition to this advantage, the comfort of the patients is materially increased, and the labour of the officers and nurses considerably diminished, by the wards and other necessary rooms communicating with each other, and being so conveniently placed as to be reached with ease.

* * * * *

In several hospitals each wing is occupied by one ward and contains all the secondary rooms for nurses, baths, &c., as is seen in the Southern District Hospital,

Liverpool, the General-District Hospital, Liverpool, the Queen's Hospital, Birmingham, the General Hospital, Birmingham, St. Thomas's Hospital, St. George's Hospital, and the Brussels Hospital. This is a very admirable and healthy arrangement, and is found to be compact and convenient in the working. When the wing is very broad, the ward is subdivided by a wall from end to end, which virtually separates it into two. Each one, however, communicating freely with the other, by means of open arches in the partition wall, as seen in the London Hospital. This last arrangement is very excellent, being undoubtedly the most compact and economical of all, whilst at the same time it allows of the most perfect ventilation. Wards containing twenty or more beds, with a small ward attached for operations, or other very distressing cases, are undoubtedly the most preferable. Those wards in which the windows are at such a distance from each other as to allow of two beds being placed betwixt adjoining windows, appeared to us as most compact, and to admit of the best internal arrangement. As it is of the greatest importance that hospital wards should enjoy as much light as possible, we found this, as well as efficient ventilation, best secured by having the windows to extend from the ceiling to within three feet of the floor. The number of cubic feet of air allowed to each bed varied from about 900 to 1,800. There can be no doubt that it is most desirable to allow as large an amount of space to each bed as possible; and we are of opinion that a lofty ward is much more healthy than a ward containing the same number of beds, and cubic feet of air, which is wider but less lofty. Many great improvements have of late been introduced into the interior of the wards. Amongst them we would advert to the use of *Parian cement* in Middlesex Hospital, as a coating for the walls. It conduces to the salubrity of an hospital, by allowing the frequent washing of the walls without injury, whilst, at the same time, it avoids the great expense and unavoidable annoyance of frequent whitewashing, or painting. The *floors* are always of wood, the surface whereof is capable of receiving a polish, and of resisting the water used in washing. This is most desirable in a sanitary point of view, and in St. Thomas's Hospital we found the floors of oak. In all cases we found that the patients dined in the wards, and that there was no special room set apart for that purpose. The nurses' rooms, which have glass doors communicating with the ward, are excellent in design, as the nurse is enabled at all times to overlook the whole of her charge. The construction of the *water-closets* is a matter of much importance. Those in St. George's Hospital and Middlesex Hospital appeared very excellent. In addition to their being self-acting, they are so constructed that when a person enters and is seated, an open window, which at all times secures the perfect ventilation of the closet, is immediately closed, and secures the patient from exposure to cold. The *sculleries* are small, and for the purpose of avoiding any accumulation of dirt, are only furnished with what is absolutely necessary. The construction of the scullery window in Middlesex Hospital is a great improvement, as it shuts out all noxious gases, and keeps up a constant state of efficient ventilation. The *bath* is frequently placed in the scullery, and, together with *washing-stands* for the use of the patients, appear to be very appropriately situated. In the Manchester Hospital we greatly admired some baths of block tin, which are formed with the concavity shallow, and scooped out equally at all parts. With the exception of a few hospitals, most of the wards are provided with a large box for containing coal, in the place of having a coal depôt attached to the wards. This arrangement is much to be preferred, as the box is easily moved to and from the cellar by the lift, and all dirt arising from coal dust is thus avoided. The *operation room* is generally placed near to the centre of the hospital. That of St. George's Hospital is very perfect, and possesses a most admirably constructed operating-table.

We found that the manner in which the *heating*, *lighting*, and *washing* of the wards are carried out is generally uniform. Open fires are almost universally employed, and we invariably found them considered much more wholesome and conducive to health, than any other method of *heating*. In the Manchester Hospital the wards are ordinarily heated by means of a hot pipe in which the steam from the boiler circulates. This, however, is aided by open fires when required. In the Southern District Hospital, Liverpool, the fresh air for the supply of the wards is admitted at the basement floor, over a series of hot metal plates, from which the air thus warmed is conducted through tubes into the wards. It is said that the temperature of the wards can thus be constantly kept as high as 60° or 70° Fahr., but that it is easily deranged by want of attention. Each ward is generally *lighted* by a small jet of gas, which is allowed to burn during the night. This is very desirable on many accounts, and is worthy of adoption. Gas is also introduced into the operation rooms, which, for very obvious reasons, is a great advantage. In the General Hospital, Birmingham, the floors are made of oak, and once in every three months, after being well washed with soda, soap, and water, are rubbed bright with wax. Dirt is removed in the interval by means of a hard brush, and the use of water for this purpose is absolutely forbidden in the interior of the wards, as erysipelas, and other unhealthy diseases, are considered by the medical officers of that institution to arise in part from the lavish employment of water in washing the floors. This fact was generally admitted, and we found that the floors of all the other hospitals were of fir, and washed completely once a week by a hard brush with water (in small quantity), soda, and soap. In addition to the employment of a small quantity of water, a dry cloth is carefully used, to absorb all that remains after the floor is cleansed, and we wish to draw special attention to this point, as the washing and scouring of the floors with sand is very objectionable.

With regard to the important subject of *ventilation*, we have seen a great diversity of systems, and observed that the most complicated and expensive is that which has been generally found to be the least effective. In some we found furnaces and towers specially built for this purpose, but now entirely cast aside. In those where ventilation was most perfect, we found the system simple and natural. *Fresh air* was allowed to enter at the windows by various contrivances, as well as through apertures in the floor, communicating with the external air. The *contaminated air* was allowed to escape through ascending flues, commencing at the ceilings of the rooms, and terminating at the roof.

In the majority of the hospitals *fresh air* is admitted through the windows by hopper-mouthed ventilators. In Middlesex Hospital, however, the following most admirable plan is adopted:—The window is divided transversely into three parts, which are capable of being opened by means of an iron lever, so that any amount of fresh air can be admitted. The general diffusion of the air is found to be so perfect by this contrivance, that not the slightest draught falls upon the patients. The same arrangement exists at the Brussels Hospital, only that each window has two of the slides moveable instead of three. In all the hospitals, *fresh air* is also admitted through grated apertures in the floors, communicating by tubes with the outside of the building. In the Manchester Hospital the air in the tubes passes over the steam pipes which run through the corridors, and is thus heated in its passage to the wards. The manner in which it is admitted in the Southern District Hospital, Liverpool, has been already mentioned when describing the methods of heating the wards. In the new part of St. George's Hospital, the wards are supplied in a very singular manner. A shaft, commencing by an open mouth, near to the roof of the building, conducts the fresh air into an air chamber in the cellar department of the hospital, from which a set of tubes conveys it, by well-ascertained laws, to apertures in the ceilings of

Admission
of fresh
air.

the wards. The superior density of the cold fresh air then causes it to fall to the bottom of the wards, thereby displacing the vitiated or heated air, which escapes by other apertures in the ceilings, and passes out at the roof by the ascending flues. With these exceptions, we found that the plan upon which the fresh air is admitted into the wards by this channel is the same as in our own infirmary, namely, tubes running under the floors and communicating at one end with the external air, and at the other with openings in the floors of the wards.

Escape of
vitiated air.

The escape of the *contaminated air* is generally sought to be accelerated by causing the ascending ventilating flues to run to the roof alongside of the chimney, and even by more active arrangements for heating it, and thus producing a draught. Those in the old part of St. George's Hospital are conveyed from the ceilings of the wards to the large fire for heating the boilers situated at the basement story, by which means the contaminated air is literally sucked out of the wards by the fire. In the Southern District Hospital, Liverpool, a fire is placed in the common expanded termination of the flues, at the roof of the hospital, to effect the same purpose, and it may perhaps be interesting to remark, that this contrivance is mentioned in our statute book as having been carried into effect in the Newcastle Infirmary, as far back as fifty years ago. In the General Hospital, Birmingham, the chimney flue, from a fire at the basement story, runs through and heats a shaft into which the flues ascending from the wards open. A similar arrangement exists in Middlesex Hospital. The new wards in St. Thomas's Hospital have arched concave ceilings, which assist the escape of the vitiated air into the openings of the flues, and here, as in the new part of St. George's and London Hospitals the flues simply run upwards alongside of the chimney, without any further arrangement for accelerating the ascent of the air. The terminations of the flues at the roof of St. George's Hospital, are guarded by valves of paper, and in St. Thomas's Hospital by moveable slides, so as to prevent any down blasts of air.

Bedsteads,
beds, &c.

We found the patients' *bedsteads* made of iron. They are generally very neat, move on castors, and have the bottom of the bedstead made of thin elastic iron hooping. Those in the Queen's Hospital, Birmingham, are particularly neat, and for the most part have been presented to the hospital. All the *beds* are composed of hair in the Manchester Hospital, the Queen's and General Hospitals, Birmingham, and Middlesex Hospital. Cocoa-nut fibre has been used in several, but is found to be much inferior to hair. Flock is universally condemned as being one of the principal causes in the production of the endemic diseases of hospitals. Straw frequently changed is used in some; but the hair mattress, from the ease with which it can be washed and dried without injury, and from its elasticity, and the fact of its not absorbing noxious effluvia, is by far the most healthy kind of bed. A hair mattress of two inches in thickness is found to be very comfortable when placed upon the elastic iron hooping, and is most economical in the end. The *counterpane* consists always of a thick cotton rug, neatly figured with the name of the hospital worked upon it. Striped cotton *curtains* surround the heads of some of the beds during the winter months of the year. The bedsteads are generally prevented from approaching and injuring the walls by means of an iron rod fixed to the floor at the distance of a few inches from the wall. A small wooden *cupboard* or closet is generally attached to each bed for the reception of the tea cups, &c., of each patient, and a copper *boiler* is fixed to one of the fire-places of each large ward for the use of the nurse and patients. The medicine, in some of the hospitals, stands in a very orderly manner upon a small *bracket* on the wall at the head of each bed. There is also, generally, a *closet* under each window, for the purpose of accommodating the clothes of patients who are able to go

Bed

Cupboard.

Bracket for
medicine.
Closets and
presses for
clothes.

about; whilst a *press* in the nurse's store room contains the clothes of patients who are permanently confined to their beds. We were much pleased at the London Hospital to see suitable prayers printed on pasteboard, together with the New Testament, conveniently placed at the top of each patient's bed, so as to be ready at all times for use; indeed, the attention which is paid in every way to the spiritual wants of the patients of this hospital is most praiseworthy.

The *kitchen department*, and the construction of the *cooking apparatus* of hospitals, have been greatly improved of late years. Great economy and saving of labour have been secured in the working of the whole, by the compact and simple arrangements which have been introduced. We were particularly pleased with those of Middlesex Hospital, and consider them well worthy of adoption. Those of the General Hospitals at Liverpool and Birmingham were also very good. Steam is extensively made use of, and the simple and superior manner in which the patients' food is divided and sent into the wards in a hot and comfortable state, in the Middlesex Hospital, is very admirable.

The arrangement in the *washing and laundry department* has also been very greatly improved. A regular system is followed, and many mechanical aids introduced, which tend materially to diminish the labour of working this branch of domestic economy. Here also, as indeed in every department of this hospital, we were highly gratified at the perfect arrangements in the Middlesex Hospital. We would wish to call attention to the improved methods of drying clothes, and more especially of the mattresses, as it is most important that the labour attending the washing and drying department of an hospital should be made as healthy, light, and expeditious as the latest improvements can effect.

The *baking and brewing* are generally carried on within the hospital, in convenient rooms; and are, for the most part, under the care of one person, who has also charge of the *boiler* for supplying water to the baths and to the hospital generally. This is usually a simple steam boiler, and in almost every hospital serves many very important purposes. In the Manchester Hospital, for instance, the steam that heats the wards is conveyed to the laboratory, where it boils all the decoctions, and assists in many other dispensing operations; cooks most of the food in the kitchen; serves for many purposes in the washing department; is used for vapour baths; and, lastly, heats a cistern of water at the roof of the institution, which supplies the baths, and hospital generally, with warm water. The economy and usefulness of this arrangement needs no comment, and it is that which is adopted in all the lately-improved hospitals we visited. In connexion with this department, and with the kitchen and laundry, we noticed the general adoption of *hoists* for the purpose of conveying the food, fuel, linen, and even the patients themselves, from the basement and ground floors, to the upper stories of the hospital; and we cannot too strongly recommend the use of these convenient and labour-saving vehicles. We found that *gutta percha speaking tubes* were used in the Manchester Hospital and the Middlesex Hospital, for the purpose of easily communicating with the nurses at the most distant parts of the establishments.

The *dead house* and *examination rooms* are always placed together at some convenient part of the building communicating with the yard at the back entrance. This arrangement allows the friends to visit or remove the dead without interfering with the interior of the hospital. We have noted many improvements both in the internal arrangements, and in the lighting and ventilation of those parts of the building. In some hospitals a hoist from the dead-house communicates with the wards at the upper stories of the building. In the General District Hospital, Liverpool, the arrangement is very good. In the London hospitals these rooms, with the library,

museum, and lecture-room, are generally associated together in a building attached to one of the wings of the hospital.

Store rooms for chaff, straw, &c., *coal dépôts*, a room for a *fire engine*, *stables*, and *sheds* for other necessary purposes, are possessed by each hospital, according to its wants, and situated in such places as are most convenient for use.

With regard to the *distribution of nurses to the wards*, we found that there is generally a *superintendent*, with two or three *under-nurses*, who are associated together in the charge of a set of wards, containing from thirty to forty or fifty patients. The superintendent is usually a better-educated person, and responsible for the proper management of the wards,

taking especial charge of the administration of the medicine, liquors, and food of the patients. The under-nurses are subdivided into day and night nurses, and perform the ordinary duties of nursing, and of cleansing the patients and wards. The washing of the bed-clothes, and of the foul linen, is done by two or three *washers*, who sometimes reside within the hospital, or are especially engaged for that purpose.

Washers.

APPENDIX XLI.

NOTE ON ARTIFICIAL SYSTEMS OF VENTILATION and WARMING in the PARISIAN HOSPITALS, by Dr. SUTHERLAND.

In a number of hospitals ventilation is effected by windows and doors, and warming by stoves placed down the centre of the wards.

This system of ventilation and warming is comparatively easy on account of the long narrow form of the wards in the Parisian hospitals and the number of windows, which generally amount to a window for every two beds, and sometimes to a window for every bed, the windows being placed on opposite sides of the ward and opposite each other, with the beds between them.

As an illustration of the extent to which economy of fuel has been carried in France, it may be stated that, while to warm a given cubic space to a given temperature by an open fireplace, consumes a quantity of fuel equal to 100, there are stoves in use which produce the same result with a quantity equal to 13 $\frac{3}{4}$.

Artificial ventilation is used in several hospitals and in a large number of public and private establishments in combination with means of warming the air, introduced both for economy in heating and to ensure the passage through the ward or apartment of a much larger quantity of air in cold weather than could be introduced unless the air were at the same time warmed.

The minimum quantity of air considered requisite to preserve sick wards in a healthy state is about 2,200 cubic feet per bed per hour, and the air introduced is raised to a temperature of 60° Fahr.

The mere introduction or abstraction of a given quantity of air from the ward is not, however, considered a sufficient test of its ventilation.

The points where the air is introduced, and the points from which it is abstracted, are elements in all the plans of ventilation in use, and are considered of equal importance with its quantity and temperature.

These three elements, then, are—

1. The quantity of air introduced.
2. Its temperature.
3. The points of entrance and exit; and
4. That apparatus which fulfils the conditions at the smallest original and current cost, is, of course, the preferable one.

That special peculiarity which characterizes the existing French methods of artificial ventilation is abstracting the air below the level of the patients' bed, instead of from the top of the ward. It is presumed by arranging the apertures for the exit of foul air near the floor, that emanations, of whatever kind, proceeding from the sick are prevented from becoming diffused through the air of the ward, that they are carried directly away from the sick bed, that each patient is enveloped in an atmosphere peculiar to himself, and that in cold weather the lower and colder

strata of air in the ward are removed, instead of the higher and warmer strata, as would be the case if the ventilating openings were near the ceiling.

In proof of the importance of this point, the well-known fact of the higher temperature of the upper strata of air in apartments ventilated from the ceiling is adduced. Thus in one of the minor theatres of Paris so ventilated, the temperature of the air on the level of the floor was found to be 18° 36' Cent. and 34° 52' Cent. at the height of 21 feet from the floor, showing a difference of 27° Fahr.; while in Lariboisière the temperature is the same throughout the whole cubic contents of the ward.

The practical result, as regards the sick, of this method of ventilation is stated to be,—

1. The disappearance of the odour peculiar to sick wards, especially in those containing wounds.

2. The complete disappearance of epidemic erysipelas, hospital gangrene, and phagedena, while these diseases still show themselves in wards which have not been ventilated in this manner.

There are three methods at present in use for renewing air in the wards of these hospitals, and each method provides for warming the fresh air introduced. They are,

1. The method of M. Léon Duvoir.
2. The system of M.M. Thomas, Laurens, and Grouvelle.
3. That of Dr. Heecke.

A fourth system of ventilation and warming differing in some respects from any of the others is being introduced into the new military hospital at Vincennes, that of M.M. Grouvelle, Chevalier, & Co., which has been selected by the French government after a careful examination into the operation of the other systems.

1. The system of ventilation and warming introduced by M. Léon Duvoir is an arrangement of hot-water pipes, heated by a furnace, and so disposed that they create a current sufficient to draw out of each ward a quantity of air equal to at least 2,220 cubic feet per bed per hour, while the pure external air entering the ward to supply the place of the impure air extracted is heated up to a temperature of about 60° F., by being made to pass over surfaces heated by the same hot-water pipes used for forming a partial vacuum and creating a current, the heated surfaces being sufficient in extent to raise the admitted air to the required temperature.

By this apparatus the whole heat of the furnace, without any intervening loss from machinery, is expended in moving and heating the mass of air in the wards. The end is obtained as follows, at the Hospital la Riboisière, one of the establishments where the apparatus is in use.

The hospital is built in separate pavilions, in three of which M. Duvoir's system is in operation. Each pavilion contains three wards, one over the other, with 32 beds to a ward, arranged two and two between the windows, and also three small wards each containing two beds. Between each two beds there is, close to the floor, an aperture about eight inches square (16 apertures in each ward) opening into as many outlet shafts, and down the centre of the ward there are three hot-water pedestals up through the middle of which the fresh air is introduced.

There is a small furnace on the lower flat of each pavilion which serves for heating cataplasms, and a boiler, the tubes from which are carried in spirals up in the chimney of the furnace to the roof of the pavilion, where the pipes enter a reservoir of hot water in a chamber, the air of which they heat. There is a chimney from this chamber rising above the roof of the building, and the shafts for drawing off the air from the wards after coalescing also enter it. The hot-water vessels rarify the air in the chamber, and cause a current up the chimney, and the partial vacuum so formed is supplied by the impure air drawn from the wards by the outlet shafts. After having created the necessary current for ventilation the water tubes are conducted down to each ward, where passing under the floor they enter and heat the hot-water pedestals, and after heating the inflowing air they return to the furnace.

The entire process of ventilating and warming is set on foot by simply lighting a fire.

The apparatus is so constructed that its heating power can be augmented in cold weather, or entirely cut off in hot weather.

It appears from a number of experiments that the mean quantity of foul air extracted from the wards by this method amounts to 2,590 cubic feet per bed per hour.

M. Duvoir's plan has been in operation for 15 years in a number of establishments, and no accident appears to have arisen from it.

The largest single apartment where it is used is the church of the Madeline at Paris, the interior of which is 100 feet in height, and the cubic contents 2,220,000 feet. The water contained in the apparatus for heating and ventilating this space is 10,000 gallons, and the quantity of warm air passed through the church amounts to 555,000 cubic feet per hour, equal to a fourth part of the cubic contents, but, judging from personal observation, this quantity is by no means sufficient. The difference in temperature in the whole height of the building does not exceed 2.7° Fahr.

The cost for ventilating and warming three pavilions at La Riboisière, containing each 100 sick, night and day during winter, for ventilating by night only during the summer, for ventilating the hospital latrines and foul linen stores all the year, and for supplying warm water for the patients, amounted in 1855 to 15,952 fr. 70 c., including the maintenance of the apparatus, or about two guineas a bed per annum.

Two objections have been raised against this system: one, the large amount of space occupied by the apparatus under the roof; the other, that it does not provide for the supply of air being taken solely from the inlets.

Experiment has shown that the air drawn out by the ventilating shafts is about double the quantity which finds its way in by the pedestals, the remainder entering by the doors, and by crevices in the windows. It is replied to this objection that the air so entering is nevertheless consumed in the proper ventilation of the wards, while the important feature of the system, namely, compelling the whole air to pass over the beds down to the floor, before it enters the extracting shaft, is preserved intact.

The apparatus at La Riboisière is capable of maintaining the temperature of 60° F., but to do so it requires careful firing. The temperature is generally lowest on the ground floor, where the ventilation is also the most active; but, by a slight modification of the apparatus, the amount of air passing through the ward, as well as the temperature, might be equalized for each of the three flats.

M. Léon Duvoir's method of ventilating and warming has the merit of extreme simplicity, combined with economy and the absence of all machinery. The amount of ventilation it gives exceeds that required by the contract by upwards of a fifth part; but it is doubtful whether the quantity of air is sufficient to preserve the wards in the healthiest possible state. The inlets are too small to supply the amount of air drawn off by the shafts. If we represent the volume of air passing up the shafts, when the doors and windows of the wards are closed, by 119, the quantity is immediately raised to 160 or 170, according to the extent to which the windows are open. This is a defect, not so much in the system as in the proportions adopted between the inlets and outlets. Foul air might be drawn into a ward by this want of proportion, as was actually the case in one instance at La Riboisière, where from the accidental opening of the door of the bath, an influx of humid air took place into one of the wards. The defect, however, admits of easy remedy.

2. The system of Thomas, Laurens, and Grouvelle, may be described as the reverse of that of M. Duvoir. M. Duvoir's system provides for the ventilation of wards by extracting air at given points, while the one now under consideration fulfils the object by injecting air at given points and by providing for its exit a similar number of shafts and openings as exist in M. Duvoir's plan. The same structural arrangements of the wards would answer for either system, the only difference being that in the one instance the air is extracted, and in the other it is injected.

For this latter purpose there are two high-pressure steam engines placed in the basement of one side of the hospital, and each engine works a large fan wheel, supplied with air by means of a shaft from the top of the building, and propels the air through a large iron pipe, suspended from the roof of the basement, which pipe is subdivided so as to supply a branch for each ward of the three pavilions into which this system has been introduced. The air tube passes under the floor of the ward in its length, and in this situation the joints are left open in order that air may escape; but the chief entrances of the air are from hollow pedestals down the middle of the ward, from which it escapes at about the height of five feet from the floor.

The two engines are not intended to be used together, unless the prevalence of an epidemic in the hospital should require a larger ventilation. Two are provided, in case of an accident happening to either of them.

The boiler is worked at a pressure of five atmospheres, and after driving the engine the steam is received into a pipe running alongside the air duct, and giving off a branch to each pavilion, which is again subdivided, and sends a branch down the centre of each ward along with the air pipes. The hollow pedestals already mentioned, through which the air is forced into the ward, are full of water, and receive into their interior the steam pipe in the form of a spiral. Each of these hollow pedestals has twelve open vertical tubes, through which the external air passes to enter the ward, and it becomes heated in the trajet by coming in contact with the heated sides of the tubes. The water proceeding from the condensation of the steam is conducted back into a reservoir, from which it is pumped to supply the boiler. The steam pipes are all covered with a non-conducting substance, to prevent the loss of heat until they arrive in the wards. During very cold weather the waste steam is not found sufficient to

warm the air, and in such a case an additional quantity of steam is supplied direct from the boiler. In the summer, when the wards do not require to be heated, the waste steam is used for heating baths. The boilers supply the laundry with steam power, and also the usual baths. Each steam engine is about 15 horse power, and only a part of this power is used for ventilating.

The fan makes about 400 revolutions a minute, and there are the means of freshening the air by throwing a small jet of water on the fans. M. Grassi* and the government engineers† have made a number of experiments to show the operation of this system of ventilation, which, as we have seen, purports to draw a supply of fresh air from the summit of the hospital to the underground basement, where the fan is situated, to propel the air along a tube to each of the nine wards so ventilated, and to provide for the exit of the air by openings on the level of the floor, 16 in each ward.

M. Grassi found that when all the doors and windows of the chamber containing the fan were shut, and the air apparently drawn only from the roof of the building, if the total quantity of air sent to the wards were represented by 1, that drawn from the roof would be represented by 0.562, the remainder 0.438 being drawn from the basement itself. This fact has been made the ground of objection against the system, for it has been stated by M. Castellan‡ that the close damp smell peculiar to underground places can be detected in the air as it enters the ward, and hence that the system supplies air only partially pure.

It appears that a quantity of fine dust drawn from the basement is carried along the air ducts by the current. Complaints have also been made of the vibrations of the blower having been heard in the wards.

These defects could easily be remedied by suitable works of construction to ensure the fans being supplied with air solely from the roof.

The air is distributed by tubes to three pavilions, situated 68 feet apart, each pavilion containing three large and three small wards, and 102 beds. The quantity of air required by contract for each bed is 2,220 cubic feet per hour. According to M. Grassi's experiments, although the results obtained by the Government engineers are somewhat less, the actual quantity of air thrown in by a single engine and fan is at the rate of 4,255 cubic feet per bed per hour. This amount is unequally distributed among the pavilions on account of the length of piping the air has to pass through. The pavilion nearest the blower receives at the rate of 4,847 cubic feet per bed per hour. The next pavilion is ventilated at the rate of 4,662 cubic feet per bed per hour, and the most distant pavilion at the rate of 3,256 cubic feet per bed per hour. This inequality of distribution admits of remedy by suitable registers.

The quantity of air entering each of the three wards of a pavilion also varies. Thus, of the three wards in the pavilion nearest the blower, the ward on the ground floor receives 5,883 cubic feet of air per bed per hour. The first floor ward 4,329, and the second floor ward 4,403 cubic feet per bed per hour. Similar irregularities in the distribution of the air are observed in the other pavilions.

It is important to remark that the most remote ward from the blower receives 3,478 cubic feet per bed per hour, upwards of 50 per cent. more than the contract amount. The temperature of the different wards varies within a limit of from 2° to 3° F.

We have already seen that all the air drawn out of the ward by M. Duvoir's method is not supplied by that which enters through the hot-water pedestals; and in the present case it is found that all the air which is driven into the wards by the fan wheel does not escape by the openings provided for its exit, and hence the plan or its application is to that extent defective. Most of the difference arises from the fact that the orifices for the escape of the air are contracted by registers, which diminish the outward current by about 29 per cent. The quantity of air which actually escapes from the wards through the registers is about 59 per cent. of the air injected, the remainder escaping by doors, windows, and crevices. If the registers were removed the whole air injected, except a little more than 11 per cent., would escape in the manner required by the system. In other words, the quantity of air that would escape in conformity with the ventilating system would be not much less than double what is required by the contract.

A more important objection, however, arises from the fact that the opening of a window or door deranges to a considerable extent the system of ventilation *as a system*. The air is still forced in, but it ceases to escape in the same quantity by the lower openings. When four windows in a ward are freely opened the quantity of air escaping by the outlet shafts is 71 per cent. of the quantity which escapes when the windows and doors are closed. The opening of a door alone diminishes the quantity by about 9 per cent.

The facts prove that the outlet shafts themselves exercise a powerful draught on the air in the ward, altogether apart from the quantity of air injected by the fan; but as the openings of these shafts are on the level of the floor, and are placed there for the express purpose of enabling the injected air to sweep downwards over the beds before it escapes, it is clear that when the windows are opened, wherever the air comes from, it cannot pass over the beds as it does when the windows and doors are shut. This is a defect in all these systems which can only be prevented by an intelligent superintendence, or by a suitable construction of doors and windows, to ensure that, as nearly as possible, all the air shall enter and escape from the wards only by the inlets and outlets required to fulfil the essential conditions of the system of ventilation, which are, as we have already seen, that the emanations from the sick are to be swept away from the beds at once without intermingling with the general atmosphere of the wards.

The degree of ventilation in *different parts of the same ward* is found to differ very considerably. On measuring the quantity of air escaping from each of the outlet shafts, it was found that in some shafts it is two or even three times the amount that it is in others. The beds in the middle of the wards have the largest amount of fresh air sweeping over them, while, generally, those at the ends have the least. This is a grave defect, but one remediable by the use of proper registers for regulating the size of the outlets.

There are no water-closets in the Hospital La Ri-boisière, but only open privies; and to prevent the emanations entering the wards, both systems of ventilation provide that a current of air shall pass down the tubes to carry away the effluvia.

The quantity of air thrown into the wards by the fan wheel is so considerable that the fact has been used as an argument for diminishing the amount of cubic space for the sick. One of the jury of the Paris Exposition, indeed, expressed an opinion that with such an amount of ventilation the sick might be put into boxes! an opinion which indicates very little practical acquaintance with the subject.

The first cost of the apparatus for the system of Thomas and Laurens, was about 4,000*l.* more than the cost of M. Duvoir's apparatus for the same number of sick. There is a difference of opinion as to the comparative current cost, because the amount of work done by the apparatus differs in each system.

* Grassi, *Étude Comparative des deux Systèmes de Chauffage et de Ventilation*, etc. 1856.

† Rapport du Chef du Génie sur le Concours ouvert pour la Fourniture des Appareils de Chauffage et de Ventilation à l'Hôpital Militaire de Vincennes. MS.

‡ Castellan *Étude Comparative*. Paris, 1857.

The advocates of M. Duvoir's plan estimate the current cost, as already stated, at about two guineas per bed per annum for warming and ventilating, while the advocates of the system of Thomas and Laurens estimate the cost of that particular system at about the same rate. The advocates of Duvoir's plan, however, state the cost of that of Thomas and Laurens, when the interest of the additional first cost is added, at 41,907 francs 61 centimes per annum, amounting to upwards of 1,000*l.* per annum more than the cost of Duvoir's for the same number of beds; but at the same time the wards are ventilated by the former system day and night, all summer, while, on Duvoir's plan, the wards are only ventilated at night during summer; the day ventilation being effected by open doors and windows.

The quantity of air which passes through the wards is also much greater. In Duvoir's plan it is 2,590 cubic feet per bed per hour, while in the plan of Thomas and Laurens it is 4,255 cubic feet per bed per hour.

After comparing the sensible effects of the ventilation in the wards under each system during cold weather, I should certainly give the preference to that of Thomas and Laurens. But the advantage is due solely to the larger amount of air introduced, and not to any superiority of one system over the other. It follows that to give the air of a ward the highest degree of freshness, the amount of air passing through it should be at least double the amount required by the French hospital contracts, or about 4,000 cubic feet per bed per hour.

3. The apparatus of Dr. Van Heecker is in operation in one of the pavilions at the Hospital Beaujon. The pavilion consists of three wards, with 20 beds in each. At each corner of the wards is a square extracting tube, and each tube has in it two square openings, one near the level of the floor and the other above the bed. These openings and tubes form the outlet shafts for the foul air, and the air ducts communicate with a small archimedean screw driven by a steam engine in the basement of the building, which extracts the air from the wards. Fresh air is admitted by a pedestal in the centre of each ward, and the air is warmed before entering the wards by being made to pass through a stove. This system of ventilation has the merit of great cheapness, since a small half-horse power engine is sufficient to ventilate three wards for 60 patients. The system of outlets is by no means so good as in the ventilating arrangements at La Riboisière, which take the air from between every two beds. The quantity of air extracted by this process is 1,462 cubic feet per bed per hour, but six-tenths of this amount enter the wards by other openings than those provided for the ingress of fresh air. The arrangements are therefore imperfect.

The archimedean screw is also used by Dr. Heecker for propelling air as well as for extracting it.

4. The system of Grouvelle, Chevalier, and Co., introduced into the new military hospital at Vincennes, is similar in principle to the system of extraction by ventilating shafts used in this country. Those portions of the hospital to which it has been applied will contain 480 beds. The outlet shafts are arranged as in La Riboisière, one between every two beds, and in each shaft there are two ventilating openings, one on the level of the floor and the other above the bed. The former is for ventilation during winter, the latter during summer. These outlet shafts descend in the thickness of the walls to the basement of the building, where they join to form a large oval air sewer, communicating with the ventilating chimney. The draught is produced by a fire at the base of the chimney.

Fresh air is taken from the basement below the level of the ground, (which is a serious defect,) by

very large air ducts rising from the basement in the thickness of the end wall of each pavilion, and giving off branches under the floor of each ward, and the air enters the ward partly by gratings, partly through pedestals ranged down the centre of the wards.

The air is to be warmed in winter by being made to pass over hot-water vessels and pipes before entering the wards.

The quantity of fresh air which must be supplied under the contract is 2,220 cubic feet of air per bed per hour.

This system of ventilating and warming was selected by the French Government after a concours, to which a number of plans were sent in, and after a careful scientific inquiry into the operation of all the systems of artificial ventilation and warming in use in the Parisian hospitals.

It may be useful to state the estimated cost of the four systems which complied with the terms of the concours.

1. Cost of Construction.

	francs.
a. Grouvelle, Chevalier, and Co.	- 130,211
b. Léon Duvoir, Leblanc	- - 154,239
c. René, Duvoir, and Co.	- - 188,000
d. Dr. Van Heecker	- - 197,211

2. Annual Cost.

	francs.	cnts.
a. Grouvelle, Chevalier, and Co.	- 27,921	75
b. Dr. Van Heecker	- - 31,095	40
c. Léon Duvoir, Leblanc	- - 32,100	50
d. René, Duvoir, and Co.	- - 46,046	10

3. By capitalizing the first cost and a ten years' outlay for current annual expenses, the total charge for warming and ventilating the hospital at Vincennes, for 480 beds, at the rate of 2,220 cubic feet of fresh air per bed per hour, stands thus:—

	frs.
a. Grouvelle and Co.	- - 409,428
b. Léon Duvoir, Leblanc	- - 475,244
c. Dr. Van Heecker	- - 508,165
d. René, Duvoir, and Co.	- - 648,461

It would thus appear that the first cost of the apparatus for warming and ventilating, under the plan selected by the French Government, is somewhat under 1*l.* per bed; the annual outlay about 2*l.* 6*s.* per bed, and the capitalized cost 34*l.* per bed.

The special feature in which this system differs from the others in use is the large size of all the inlet and outlet shafts for air. These greatly exceed in dimensions those in use under the other systems.

The object of this is to facilitate the movement of so large a mass of air, and to save the inevitable loss of force from extracting air through narrow ducts and apertures. The military engineers selected this method for the hospital at Vincennes, on account of its greater cheapness, and because they have arrived at the conclusion, after numerous observations, that a much better ventilation is obtained by extracting air from, than by propelling air into, wards. The first method ensures, they say, the immediate removal of emanations from the sick, while the second may create a blast in a ward without necessarily ensuring good ventilation. They object, also, to the use of machines, any accident to which would stop the whole ventilation of the hospital. The system of extraction by an air shaft is in use at the prison Mazas at Paris. The air ducts in that instance are very large, and the construction simple; and it is found in practice, that 1 $\frac{3}{16}$ lbs. avoirdupois of coke extracts 45,584 cubic feet of vitiated air in winter, and 31,801 cubic feet in summer. The quantity of air to be extracted from the whole hospital at Vincennes amounts to 939,800 cubic feet per hour; and the cost of coke for this and for warming the air when required, is estimated at about 24 shillings per diem.

APPENDIX XLII.

PAPER given in by Mr. MARTIN.

The following note was prepared by Mr. Martin by desire of Lord Metcalfe, and handed by him to Lieut.-General Sir George Murray, at a meeting held at the Colonial Office by order of Lord Stanley, on the 16th of July 1842:—

1. "The author of this note has satisfied himself, from an extensive range of observation in the East Indies, that great loss of life, injury to health, and sacrifice of the public money, have resulted from the present modes of locating and constructing barracks and hospitals for the European troops there; and his information, derived from printed and other sources, leads him to conclude that similarly injurious results are also produced in various of Her Majesty's colonies, from similar causes.

2. "To obviate for the future such extensive waste of life and money, and with a view, likewise, to improve such existing buildings as may admit of amendment, it is proposed that standard plans and models be prepared for barrack and hospital accommodation, in scale proportioned to certain given numbers of men, and suited to the various and contrasted climates occupied by British troops. The most cursory observation will satisfy us, that of certain given plans one only will prove excellent; whereas now all over the British possessions we find in existence every conceivable plan, ending in no approved or fixed plan whatever; so that, in fact, that which ought to be settled, and is

very easily capable of being settled by regulation, is up to this day left, as I have stated, to the fancy of individuals.

3. "It is not apprehended that either difficulty or the expenditure of much time would be encountered by carrying out the proposed plan, provided it were undertaken by persons competent to the task; for the same plan of barrack and hospital accommodation would suit the climates of the East and West Indies, the Cape of Good Hope, Mauritius, Ceylon, China, and Australia, the stations of Gibraltar and Malta, and the Ionian Isles, while plans for the other colonies would be easy of settlement.

4. "To arrange and complete so desirable an object, it is respectfully suggested that a committee of engineers and medical officers be assembled in London, and that power be given, in furtherance of the purposes in view, to call in evidence such persons as may be supposed to possess experience and a knowledge of the subject." (Signed) J. R. MARTIN.

Sir George Ballingall, in the last edition of his admirable 'Outlines of Military Surgery,' says of the memorandum just quoted:—"This excellent suggestion has not been as yet acted upon, and consequently no established plan has been adopted for the construction of barracks and hospitals either at home or abroad."

APPENDIX XLIII.

(Given in by Dr. A. Smith.)

PAPERS showing the Necessity for a NEW GENERAL ARMY HOSPITAL, which were submitted to LORD PANMURE by Dr. A. SMITH, in January 1856.

No. 1.

MEMORANDUM relating to the Hospitals of Government which at present exist in Chatham and its Vicinity.

The hospitals at Chatham which belong to government are, the naval or Melville hospital, the Ordnance hospital, Fort Pitt general hospital, and the Spur Battery hospital. The first was built for the accommodation of the sick of the royal marines quartered at Chatham, and of such seamen as might be affected with diseases not to be readily managed on board the vessels of war of the station, whether in commission or laid up in ordinary. The second was erected for the reception of the sick of the soldiers of the ordnance department who might be stationed here, and it is now almost entirely occupied by sick of the line. The two others are specially for sick of the line; that in Fort Pitt being principally required for the wants of the invalids, and the other, or Spur Battery hospital, is allotted for the sick of whatever regiment may be quartered in the garrison; and any accommodation it can afford beyond that necessary for the corps, is made available for general purposes.

In remarking upon these different hospitals, I shall notice,—

1. The character of each as a building;
2. Their exterior appurtenances, equipments, and interior conveniences;
3. The number of sick which each is calculated to accommodate; and,
4. The medical and other attendance afforded.

The Naval or Melville Hospital.

This hospital has a magnificent appearance, and affords proof of its having been wisely planned and efficiently built.

Its site, which is upon gently sloping ground, renders it a conspicuous object on approaching Chatham from London, and is, of all the buildings at Chatham, the one which most attracts the attention of the traveller, and gives him an exalted idea of the liberality and munificence of the British naval department. It was erected in 1827, after a plan of Mr. Taylor, architect to the Admiralty, and built by Mr. McIntosh, of Bloomsbury Square, London.

The structure is brick, faced with cement and Portland stone, so that it looks like a fine stone edifice; and it is agreeably ornamented with a massive colonnade, which extends the whole length of the building, and affords a comfortable place for the sick to walk under during inclement weather.

Behind and detached from the hospital are the requisite buildings for the wants of this establishment; and though these are not attractive, either from their architectural beauties or elegancies, they are, nevertheless, remarkable for their efficiency, amplitude, and neatness. Still further behind, and on a more elevated situation, are the dwellings of the medical and other officers belonging to the establishment, all of which are neat, ample, and commodious. The grounds around the building are of moderate extent, and are completely inclosed by a high brick wall, not, however, so situated as to limit the prospect from the establishment. They are neatly laid out, and as they extend considerably in front of the hospital, they offer a most agreeable scene for the sick to look upon, and seats are placed here and there, so as to afford in that respect the fullest comfort to such of the patients as are not bedridden.

Passing to the interior of this hospital, the like efficiency and adaptation for useful purposes, which

is characteristic of the exterior, is found to exist there.

The wards of the sick are of a proper size, neatly constructed, and well lighted and ventilated; each is calculated to accommodate about fourteen patients, and to afford besides a clear space of from two to three feet between any two bedsteads. To each ward is annexed a water-closet, which is so readily accessible from the ward that only severe bedridden cases are necessitated to comply with the calls of nature in the sick rooms in which they are treated.

The bedsteads of this establishment are of iron, and the bedding is ample, and of a superior character: each patient lies upon a hair mattress, rests his head upon feather pillows, and a cleanliness and neatness is given to his bed by its being covered with a white quilt or counterpane.

The minor details are upon a like liberal scale; and everything connected with the hospital conspires to excite the approbation of visitors, and ensure satisfaction and comfort to the sick.

Two hundred patients, in addition to a considerable number of commissioned officers, can, without inconvenience, be accommodated in this hospital, and without withholding from any one of that number the enjoyments and advantages above stated.

The receiving into hospitals, and treating in them commissioned officers, is a practice, I believe, peculiar to the naval department, and, in my opinion, is a most politic one, and highly calculated to insure great advantages, both to the service and to individuals. Did a similar practice exist in the army many valuable lives would be saved to the service, and which are lost simply from a lack of many of the requisites necessary to aid the medical remedies employed.

The sick soldier has great advantages over the sick officer. The former is certain of having the necessary domestic attendance, the latter may or may not, according to the character of his servant; thus when the latter is irregular, the officer is in a measure left without the comforts, nay, even the absolute necessities, for his condition; that is to say, he has only that portion of them which can be enforced for him by his medical attendant.

Besides affording a guarantee against such disadvantages, the practice furnishes a facility of curing disease not to be otherwise insured, as it permits of the proceedings and diet of the sick being properly regulated, and hence insures officers being rendered efficient in shorter periods than are required where the proper restrictions cannot be enforced.

The strength of the marines and seamen at Chatham can scarcely ever be so great as to furnish the proportion of sick which may be accommodated in this hospital; hence the establishment is at all times free from undue incumbrance, and the medical officer in charge feels a satisfaction in knowing that he is able to render through the establishment over which he presides all the medical assistance which is necessary to the interest of the public department to which he belongs; and hence his condition is very different to mine. He has suitable accommodation and conveniences for every man he finds requiring medical assistance: I, on the other hand, am forced, on any extraordinary increase of sick, to convert barrack-rooms of a most inferior description into apartments for their reception.

The expenditure in building the naval hospital and its appurtenances, is reported to have been about 60,000*l*.

The Ordnance Hospital.

This of the buildings here is second only to Melville hospital; and though it has neither the architectural beauties nor the magnificent appearance of the naval establishment, yet it is a building creditable to the department for which it was erected, and even to the country.

Like Melville hospital, it stands in a position which admits of its being visible to passengers journeying along the principal high roads, and hence draws forth the remarks and eulogiums of travellers. It was built during the years 1809, 1810, and 1811, and is supposed to have cost about 30,000*l*.

The conveniences necessary for the establishment, and which could not with propriety exist within the wall of the hospital, are afforded by a range of small buildings some way in rear of the principal edifice; and though they are not very deficient, they are, nevertheless, far inferior to those of the naval establishment.

The reserve grounds around this building are less extensive than those of the Melville hospital, but, nevertheless, they are sufficient. They are deficient, however, in neatness and regularity, and are without the seats which are always placed about the airing-grounds of the naval hospital, and which prove so acceptable and convenient for the sick who are permitted to take exercise in the open air. Like the grounds of the naval hospital, those of this establishment are also surrounded with a brick wall; but in front of the hospital it is sufficiently distant to in no way interfere with the prospect offered to the adjoining country.

The wards of the ordnance hospital are, in my opinion, rather too small, inasmuch as a room holding only eight or ten sick can never be kept so neat and clean as one accommodating twelve or fourteen. That important provision, a water-closet for each ward, of the naval hospital, is not extended to the ordnance hospital; but the next best substitute, viz., two or more conveniences of that description are adjacent to the principal passages, and open from them. In reaching these there is not the like facility, nor an equal safety to the patients, which exist in the naval establishment, nor can the same proportion of patients generally make them available, and so circumscribe the nuisance, which otherwise arises from a majority of the patients being forced to resort to close-stools placed in the wards.

In searching into the differences in this and other respects between the ordnance and Melville hospitals, I have been forced to surmise that medical opinions must either not have been required, or, if required, not allowed much weight in regulating the plan of the former establishment. Medical men only can rightly comprehend what is requisite for the wants of sick, and hence I fearlessly assert no hospital will ever be properly planned and placed excepting under their directions.

The beds of the ordnance hospital are of iron, and the bedding of the sick is similar to that of the line, namely, a mattress stuffed with straw, a bolster filled with the same, and blankets, and a rug similar to what are in common use in barracks.

Fort Pitt General Hospital.

This hospital is situated in the interior of a small fort, and in consequence is scarcely visible beyond its own walls.

It consists of two heavy brick buildings, in parallel ranges, with a paltry colonnade abutting the range in which the principal entrance is placed. It was built in 1800 or 1801, and was, when finished, designated the "Royal Hospital."

There is nothing in its appearance to attract attention, and were it elsewhere, without its wooden colonnade, it would, probably, be surmised to be a merchant's warehouse.

For a time after it was built it was occupied as a barrack, and soldiers were quartered in it during the whole of the time Fort Pitt was building.

So far as I can learn, it was not appropriated to the purpose for which it was raised till the commence-

ment of 1814, when it was deemed necessary to abandon Chelsea, and fix the invalid establishment at Chatham.

The buildings—which from the purposes for which they are required, could not with propriety form a portion of the edifice destined for the accommodation of sick—are very limited in number, and of a character that makes me shrink from describing them. The washhouse is a sort of abutment to a portion of the wall of the General Hospital, and, from its want of breadth, will, scarcely permit of one person passing another; the drying and getting-up room of the clothing is in the tower, on the top of which is situated the water reservoir, and when entered gives the idea of a half-lighted vault.

The stores for the clothing not in actual use, and which is under charge of the purveyor, consist of long insecure wooden structures, out of which the rain is with difficulty kept by means of their roofs being covered with tarpauling; and such of the apothecary's stores as cannot be heaped into the small room allotted to him in the hospital, are kept in an underground cell, to reach which it is requisite to travel along a dark subterraneous passage of about a hundred yards in length. Many articles which had thus, from want of room, been long deposited under ground, in a situation where there existed no means of averting the injurious effects which result from damp and the want of due ventilation, were lately found to be perfectly useless by a Board which was ordered to examine and report upon them.

Having stated so much, it will scarcely be necessary to observe, that I consider there is not a single out-building attached to the general hospital which is tolerably fitted for the use to which it is applied.

There are no airing grounds to the general hospital like those attached to the naval and ordnance hospitals, so that the patients accommodated in the former have no opportunity, either whilst under treatment or when convalescent, of enjoying the advantages which result from moderate exercise in the open air, nor have they the comforts which an agreeable prospect is calculated to afford.

The only localities to which they have the opportunity of retiring, are two small inclosed areas immediately behind the hospital, each measuring 57 feet in length and 29 in breadth, and such as temporarily fly to them are required to encounter a most offensive effluvia which is incessantly issuing from the privies, which are actually situated within these areas, and which, during the prevalence of certain winds, prove even a nuisance in the interior of the hospital.

If the privies were of a construction calculated to circumscribe as much as possible those disagreeables, the necessary attributes of such places, the free space around them might be less contaminated, but as they are of the commonest and most inferior description, namely, a deep sink to receive the deposits, and a rude abutment along the brick wall to shelter from the weather the persons who may resort to them, and who are required to be cautious while occupied, as there are no regular seats, but simply a longitudinal beam in front, for the visitors to sit upon.

The presence of such offensive effluvia in the vicinity of these places, and which sometimes even extends into the interior of the hospital, is chiefly to be ascribed to the rude and open manner in which the privies have been constructed, and to the want of the means of carrying off the excrement as it is discharged. When the accumulation of the latter in the sinks is so extensive as to render it necessary to empty them, which is effected by forming a hole on the outside of the wall, and through it shovelling out the filth and removing it in carts, the nuisance is so great, for days together, that it is scarcely possible to approach the spot.

The interior of the hospital comprises, besides the office of the principal medical officer, the surgery, the

apothecary's store, and the inspection room, eight large and two small wards for the accommodation of the sick. The former (the large wards) are of too great a size, and double the quantity of coals which is allowed, with the grates hitherto in use, would not keep every part of the ward during the severe winter of a temperature congenial to sick men.

No water-closets are attached to any of the wards, nor even are there substitutes for these opening from the passages, as is the case in the Ordnance Hospital. In the General Hospital the case of the patient is either to cross one of the areas already mentioned, and resort to the open privies, or else to use a close-stool in the ward, and have its contents carried off and evacuated into the general receptacle. The latter practice, from the offensive smell it originates in the apartments, is far from a desirable one, nevertheless, it is that we are bound very generally to enforce, not only to guard against aggravation of disease from exposure to cold, but also to prevent accidents to weakly men, from their having a difficulty in keeping themselves from falling when they resort to the privies, owing to the rude open seats upon which they must of necessity rest.

The bedsteads and bedding in Fort Pitt general hospital are similar to what are issued for soldiers in barracks, and very different to what is granted to the naval establishment. Men in health may feel no inconvenience from lying upon straw, but in sickness, I am not prepared to consider such as probable. The minor equipments are in keeping with the more important ones already noticed.

The general hospital is now calculated to accommodate 252 sick, and when all the beds are occupied, there is exactly two feet between every two patients, but the interval will shortly be greater, as the bedsteads now in use, being unnecessarily broad, are being narrowed by order of the Ordnance Board, and when the alteration shall have been completed, there will then be an interval of thirty inches, instead of twenty-four as formerly.

The Spur Battery Hospital.

The character of this hospital is so inferior, that I feel ashamed to notice it; and I am certain there is not a medical officer in the British service who would regard it as a building which might permanently be employed for the accommodation of sick.

It is situated on a small fort behind Chatham barracks, is bomb-proof, and its exterior wall forms the inner side of the ditch. The windows of that side look into the ditch, and those of the lower or basement storey are below the level of the surrounding country; the rooms are small, badly furnished, and exhibit a disagreeable appearance.

The grounds adjoining this hospital, over which the patients may walk, are moderately extensive, but so uneven and uninviting that they are resorted to but little.

The wards are moderately large; but those of the upper storey are deficient in breadth, and have an unpleasant aspect from their being low and arched above.

Those of the under or basement storey are nearly square, moderately lofty, and are floored with brick; neither those above nor below are adapted for a permanent hospital.

There are no waterclosets within the walls of this hospital, hence the sick who are not in a condition to admit of their exposing themselves to the weather, must, as the only alternative, resort to close-stools in the wards.

The bedding and minor equipments are similar to those described as in use in the general hospital.

The Spur hospital, without unduly crowding, will accommodate 64 patients.

Medical and Inferior Attendants at these Hospitals.

The naval hospital is under the direction of a deputy inspector-general of hospitals, who resides in one of the buildings already described; and who, I believe, prescribes for a part of the sick, while the other part is cared for by the resident surgeon. In addition to the latter, there is a resident assistant surgeon, of some standing in the service, and what other assistant surgeons may be necessary.

The domestic attendants are partly males and partly females. The immediate attendants upon the patients being all females; and one of these, under the name of nurse, is allowed for every seven patients.

The remuneration to servants, I have reason to believe, is nearly the same as that granted under the sanction of the Secretary-at-War to the domestics employed in the hospitals of the line.

The ordnance hospital.—With the exception of three wards of this hospital, the whole establishment is appropriated for the accommodation of sick of the line.

The soldiers here at present who require to be admitted into hospital as sick of the ordnance department are about 200, and there is for the medical duties of this detachment an ordnance surgeon of considerable standing. The sick of the line accommodated in the ordnance hospital generally amount now to about 160, and are treated by the surgeon of the provisional battalion, assisted by a staff surgeon of the 2nd class, and three or four assistant surgeons. These medical officers have, in addition to their duties in the hospital, to inspect all recruits joining the garrison, which at times are very numerous; to make health inspections of the garrison; to examine all soldiers who join, with the view of ascertaining if satisfactory marks of vaccination exist, and to furnish medical attendance to the officers and their families, and to the soldiers' wives and their children, which, considering the strength of this garrison, nearly 5,000 men, is no easy duty.

Fort Pitt general hospital has at present a medical staff consisting of three staff surgeons of the 1st class, one the principal medical officer, two staff-surgeons of the 2nd class, and three assistant-surgeons, and these, without including the principal medical officer, are to treat the sick of the establishment, the daily average of which is 250. Besides the necessary ward duties, two of the staff-surgeons, one of them is in charge of the lunatic asylum, and is also required to inspect all ships embarking troops at Gravesend, and both are almost daily employed as members of Boards, in conjunction with the principal medical officer. The duties of the latter are to superintend and direct the general affairs of the hospital establishment, to carry on the necessary correspondence with the authorities at head-quarters, with the commandant of the garrison, to provide for and direct all the medical arrangements of the station, and to examine and decide upon the cases of all soldiers who arrive at Fort Pitt recommended to be invalided, and the performance of these duties occupy between seven and eight hours of each day.

The duties of the two other staff-surgeons, again, require for their performance about five or six hours of each day, and on many occasions even more, particularly those of Dr. Sillery, who is required to inspect ships at Gravesend, a duty which occupies him occasionally for hours in succession.

The Spur Battery hospital is under the charge of a regimental surgeon, and the duties required for it are performed by the medical officers of the corps for whose sick it affords accommodation.

General Observations.

The preceding remarks are only calculated to furnish information which will admit of an imperfect contrast being drawn between the principal hospital

of the line in this kingdom and second-rate hospitals of two other establishments of the government.

This is not as it ought to be; a contrast, if such is to be desired, ought to be made between hospitals which ought to bear the same rank. The general hospital at Fort Pitt ought to be considered with the naval hospital at Haslar, and the ordnance hospital at Woolwich, the two latter being the chief medical establishments of their respective departments, and, therefore, to be classed with the general hospital at Fort Pitt, which is the principal medical establishment of the line.

As it regards Haslar hospital, I have reason to believe there is no medical establishment in the empire which makes an approach to it. It is, I understand, calculated to accommodate 1,800 sick, in addition to all the domestics and officers necessary for their proper treatment and management.

There were, I have heard, 1,840 sick dieted in that establishment in February 1808, and I have no reason to suppose there was any difficulty in supplying all with the proper accommodation.

The grounds belonging to this hospital are surrounded by a brick wall of about a mile in circumference, and the greater part of them are applied as airing grounds for the sick, are tastefully arranged with clumps of shrubbery, and well supplied with seats for the patients to rest upon.

In addition to these provisions for the wants of the sick, I believe elevated mounds, designated "Look-out places," have been raised to furnish a prospect which could not otherwise be enjoyed, and though such comforts cannot be insured without considerable expense, the original sacrifice is doubtless amply repaid by that attachment to the service which must necessarily be the result of such consideration and treatment. Besides being possessed of such advantages, the establishment is in every other respect provided in the most liberal manner, and it lacks none of the requisites which are calculated to insure the comfort, and promote the recovery of sick.

The medical staff for Haslar is upon a scale unknown in hospitals of the line. It consists of an inspector-general of hospitals, two deputy inspector-generals, one surgeon, and four permanent assistant-surgeons, with such other assistant-surgeons as may be requisite for the wants of the establishment.

Fort Clarence lunatic asylum, about	84

Obs.—The sick for the naval hospital are derived from the royal marines, and from the seamen of the navy stationed at Chatham and Sheerness.

The strength of the latter is very variable, that of the marines runs from 500 to 1,000 men.

The Ordnance Department has to provide for the sick of about 200 men, and for those three rooms are appropriated in the ordnance hospital. The strength of the line now that the new arrangement has been completed, will, it is calculated, be generally close upon 5,000 men, exclusive of invalids; and, though the strength will diminish during the period embarkations are going on, yet no great reduction of sick will be the consequence, as recruits are daily joining, and they generally furnish a higher proportion of sick than is afforded by bodies of men accustomed to the service.

The number of invalids here on some occasions amount to between 600 and 700, and, considering that a great majority of them are diseased and infirm men, it is easily to be understood that ample hospital accommodation is required for their wants.

Fort Pitt, June 12, 1843.

No. 2.

Dr. A. SMITH to Sir JAMES McGRIGOR.

Principal Medical Officer's Office, Fort Pitt,
January 11, 1844.

SIR, I HAVE the honour to transmit to you herewith a copy of a letter I forwarded for the information of the commandant, agreeably to his order.

I have, &c.

(Signed) ANDREW SMITH, M.D.,
Principal Medical Officer.

Sir James McGrigor, Bart.,
Director-General, Army Medical Department.

Enclosure.

Dr. SMITH to Captain ANDERSON.

Fort Pitt, Chatham,
January 7, 1844.

SIR, I HAVE the honour to acknowledge the receipt of your letter of December 27, 1843, requiring, for the information of the commandant, "an explanation of the last paragraph of my letter" of the 18th of the same month.

As regards that paragraph, I have the honour to state, that the reasons which suggested the observations contained in it are numerous; but as a detail of all would extend this communication far beyond the limits of a letter, I shall satisfy myself simply by instancing on the present occasion, those which I consider the principal and most obvious defects of the invaliding establishment.

The most important, then, are—

1st. The want of sufficient hospital accommodation to admit every case of real or reported disability being immediately on arrival here put into a position to be tested, and either verified, or, on the contrary, found fictitious.

2nd. The total deficiency of means of insuring exercise in a healthy position to the sick, recovering from real and serious disease.

The non-existence of the means of separating the really disabled soldiers from others not proved to be so; and,

Lastly, The absence of many of the most important conveniences necessary to enable the carrying out the successive steps requisite to be taken in proving the existence or non-existence of disabilities.

With reference to the first, perhaps the most important defect, I may observe, that I have for years past been satisfied that the utmost possible good to the public is only to be insured by submitting every case, in which a disability is not very manifest, to such a scrutiny as can only be insured from a longer or shorter period of observation in the general hospital; and from having entertained this view, I was led, on being appointed principal medical officer of the establishment, to try, so far as the limited means at my disposal would permit, the plan which I had regarded as alone calculated to guard against the public being burthened with the payment of pensions to men not in reality disabled.

For the last three years that plan has been rigidly observed, and the results have been most satisfactory, nay, superior to what my expectations, though sanguine, led me to expect.

In 1841 I succeeded in restoring to the service, by the aid of able and zealous medical officers, for the

direction of the treatment of disease, 481 men; in 1842, 716; and in 1843, 859.

Now, with such unquestionable proofs of improvement over past years, and which will be best seen on a reference to a return No. 1 (hereto appended), I think it unnecessary to say more, than that the advantages which have resulted were not so speedily insured as they ought to have been, and hence the country was put to an expense which would not have been required had there been always here sufficient hospital accommodation to have permitted of every case, whether of real or only alleged disease, having been taken under observation as it presented itself, instead of only as there became vacancies in the hospital from the discharge of individuals who were in it, when the wants of others were discovered.

The present hospital accommodation is little beyond what is necessary to meet the wants of cases of real and serious disease; hence, had many others, of a less important nature, not been disposed, so far as it was possible, in rooms in the barracks, I should not, during the past summer especially, have been able to have tested sufficiently more than half of the men who have been actually restored during the past year to the service; therefore, would probably have been necessitated to find that proportion unfit for further service, and have thus increased very greatly the number of the non-effective list. The rooms which were appropriated to afford temporary hospital accommodation (though they cannot be pronounced to have been very well suited for the purpose) were, nevertheless, very useful, and if there had been a possibility of keeping the sick which were placed in them apart from the other inmates of the barracks, I have no doubt but that even greater advantages would have resulted.

The second defect is one which militates greatly against success in the treatment and cure of disease. The patients in the general hospital, usually about 250 in number, are either congregated in the wards, or to be seen endeavouring to enjoy the air in two small areas behind the hospital, neither of which is more than 58 feet in length, and forty in breadth; in each of which is situated a large privy, from which the most offensive effluvia always proceed, and which so contaminates the air, as to render it anything but conducive to the invigoration of those who are able to seek improvement from exercise out of doors. A medical man must have benefitted little by experience, who does not know that disease is often overcome by the help of pure air and exercise alone, when other remedies have failed; hence, I should say, if every exertion is to be made with a hope of diminishing the number of the non-effective of the army, an airing ground, and proper conveniences for the use of the convalescents, ought most certainly to exist in the establishment.

Attempts have been made, though not by myself, to furnish these requisites, by permitting the convalescents to wander over the interior of the fort, but these have never been continued for any length of time, from its having been found that evils always result from the difficulty of preventing intercourse between the convalescents and the soldiers who were quartered in the barracks. I mention this to show that the medical authorities, even before my time, were not insensible of the defect in question, and not a little anxious to remove it.

So long as barracks filled with soldiers, and an hospital filled with sick, shall exist in the small space included within the walls of Fort Pitt, I see no way of rendering the interior of the latter available for the wants of men convalescing from disease; but, on the other hand, if the men who did not require hospital treatment could be quartered elsewhere, the deficiency in question might be supplied, and an opportunity be afforded of permitting such of the sick as were not bedridden to breathe (what they cannot at present do) a pure air, and escape from the noxious and disgusting effluvia of privies, urinals. &c.

The third defect, is productive of great moral difficulty, as, from its existence, the efforts of the ill-disposed constantly gain strength, from results which are hourly being made known amongst them. Individuals who have not had the experience here which I have had, may view the defect in question as one of little importance; I doubt not, however, but that they would see the evil instanced as distinctly as I do, were they to become aware, as I have, that every step of the invaliding process is commented upon by those who have undergone it, and that hints are taken by many who wish to escape from the service, which often conduce to render their cases more obscure than they would otherwise be.

The many ways in which that evil operates, I shall not attempt to particularize, but shall simply claim for myself the privilege of maintaining that such an evil does in reality exist, and that I am not likely to have come to such a conclusion on trifling grounds, especially considering that I have for nearly thirty years been accustomed to observe the working of human nature as manifested in soldiers.

The last of the more prominent defects, and which consists in the want of many of most important conveniences necessary to enable the invaliding process to be carried out efficiently, might be made to embrace very many deficiencies, but I shall simply mention the most prominent, viz., the want of a room, apart from the hospital, in which to examine soldiers proposed as invalids; and, secondly, the want of sufficient light in the ward which is at present appropriated as the inspection room.

For nine months in each year, the passages of the lower floor of the hospital are almost daily crowded with men marched from barracks to be examined by the principal medical officer, and, owing to this condition of things, an objectionable intercourse takes place between men from the barracks and patients in the hospital, which no human effort has hitherto been able to prevent. But this evil, though great, is not the only one which results from the practice: the quiet so requisite for an hospital is of necessity unknown in Fort Pitt, and the movements and operations of the servants and others of the establishment are often so impeded as to cause inconvenience, nay injury, I may safely say, to the service.

The room in which the inspections are carried on is the one in which the ward-masters are expected to make up their returns of diets, and in which the fresh cases of sick reported ought to be examined before being taken into hospital. To these very necessary purposes, however, it is not available during the greater portion of each year, hence both of the duties specified are performed in a ward generally filled with sick, and from that circumstance a very unsuitable and improper place. The employment of this room for the inspection of invalids is otherwise objectionable, it is not lighted so as to admit of intricate disease, particularly of the eyes, being distinguishable; hence it is often found necessary, in examining men proposed to be invalided, or recruits objected to, and submitted for the decision of a medical board, to seek a favourable light, by trying for it in different parts of the room, and when, as often happens, it is not to

be insured within walls, it becomes necessary to proceed with the person under examination into the open air, to secure that which certainly ought to exist in an apartment which is resorted to in the making of such important investigations.

As the commandant requires of me to state how I would propose to remedy the defects particularized, I would suggest:—

1st. That Fort Pitt be converted into purely an hospital establishment, and that all the buildings in it, with the exception of those which are required for the accommodation of individuals engaged in the working of the invaliding establishment, ought to be appropriated for the accommodation of sick, and of men whose disabilities require to be verified by further medical observation.

2ndly. That men whose disabilities are manifest, but who do not require hospital treatment, should be quartered in some building remote from Fort Pitt.

3rdly. That all soldiers proposed as invalids should, on arrival at Fort Pitt, be, according to circumstances, either apportioned to the hospital department, or to the barracks elsewhere; and that those who are placed in the latter should have no admission into Fort Pitt, unless through sickness or other special grounds.

4thly. That an accurate selection of the cases for the two establishments should be made by the principal medical officer, instead of the orderly officer as hitherto, and that the former should examine each party arriving, and fix the localities in which each individual is to be lodged.

5thly. The gate of the fort should be shut against visitors, excepting such as on business, or for other purposes, wish to see the residents belonging to the establishment.

6thly. The whole of the space within the walls in rear of the hospital should be appropriated, as exercise and recreation ground for such of the sick as are in a state of convalescence, and which, if the gate is shut to visitors, may be done without the prospect of any inconvenient results.

7thly. That an inspection room, of a description better adapted for the purposes for which such is required, should be conceded to the establishment.

8thly. That a commission of inquiry, composed partly of military officers, and partly of medical, should be ordered to report the defects more in detail than I have done, with a view that the numerous minor ones especially, which I have not attempted to instance, may be set forth and lead to proper remedies; and,

Lastly. If the rate of pension allowed by the warrant of November 1829 could, without injury to the country, be made again that to which the young soldier might look, many of the disabilities now professed by this class, which there are strong grounds for believing are often magnified, if not simulated, would cease to exist, and would probably be replaced by a disposition similar to that which is now evidently influencing the old soldier, viz., a desire to serve until the full rate of pension is to be insured.

I have, &c.

(Signed) ANDREW SMITH, M.D.,
Principal Medical Officer.

APPENDIX XLIV.

COPIES of CORRESPONDENCE on the Subject of a
MILITARY LUNATIC ASYLUM.

(Furnished by order of the Secretary of State for War.)

Office of Commissioners in Lunacy,
MY LORD, 19, Whitehall Place, 27th March, 1857.

As chairman of this board, I have to bring under your Lordship's notice the extract, which is copied on the other side of this sheet, from a report of a visitation made on the 7th instant, by two commissioners, to the Haslar Royal Naval Lunatic Hospital.

You will here find a practical illustration of the hardship of no provision having as yet been made for the care of officers and soldiers of unsound mind, in a military lunatic hospital similar to that of Haslar. I forbear to dwell on the frequent recurrence of cases, brought under the notice of the board, in which the evils arising from the entire absence of all such necessary and humane provision, are more gravely exemplified.

But adverting to the fact that the select committee on the medical department of the army, in their report presented to the House of Commons in July of

last year, recommended "that a new military lunatic asylum be provided, as embraced in the design of "the new military hospital at Southampton," I beg to inquire of your Lordship whether any steps have been taken, or whether any are now in contemplation, to provide such an asylum?

I have, &c.

(Signed) SHAFTESBURY,
Chairman.

The Lord Panmure.

Extract from the Report of Commissioners in Lunacy on Haslar Royal Naval Lunatic Hospital.

"Before concluding our report, we think it right to bring under the special notice of the board the fact, communicated to us by Dr. Stewart, that, within a recent period, as many as eight military officers or soldiers have, under circumstances of great emergency, no provision being made for their care in a military lunatic asylum, been received into Haslar hospital.

"In a case admitted a short time ago,—that of an insane soldier from the Portsea prison,—owing to the ignorance and inexperience of the persons in charge of him, the patient was brought tightly bound, with his hands corded behind him in a cruel manner."

MY LORD, War Office, 26th May 1857.

I HAVE the honour to acknowledge the receipt of your Lordship's letter of the 27th March last, in which you forward an extract from a report of a visitation made by two of the commissioners in lunacy to the Haslar Royal Naval Lunatic Asylum, and in which you urge that provision should be made for the care of officers and soldiers of unsound mind in a military

lunatic asylum similar to that at Haslar, and to inform your Lordship that, after giving this important subject the fullest consideration, I am of opinion that it would not be conducive either to the interests of the public, or to those of the patients themselves, to have a special asylum for the permanent care and maintenance of military lunatics, but that it is preferable to continue the present system, whereby after temporary treatment and observation in a lunatic ward or building attached to a general military hospital, the insane soldier is either discharged to the care of his friends or his parish, or is transferred to the private lunatic asylum at Bow, where numerous military lunatics are now maintained, and of which the most satisfactory reports have been from time to time received by me from the military medical officer, by whom the asylum is periodically inspected.

With a view to the proper care and treatment of the military lunatics prior to their discharge from the army, I have given the necessary instruction for the provision, in addition to the new lunatic house recently completed at Chatham, of a ward or wards in the Royal Victoria Hospital now in course of erection, to be fitted up with every requisite for the most effective treatment of such cases of insanity as may occur in the ranks of the army, as I am fully aware of the advantages to be derived from the skilful and efficient treatment of this disease in its earliest stages, at the same time that I am strongly opposed to the principle of founding a permanent asylum at the cost of the public, for this or any other especial class of military invalids.

I have, &c.

(Signed) PANMURE.

The Earl of Shaftesbury,
Chairman of the Board of
Commissioners in Lunacy.

APPENDIX XLVIII.

CORRESPONDENCE relative to the TRANSPORT of SICK and WOUNDED from the Crimea to England.

(Given in by Dr. Smith.)

EXTRACT from a LETTER, addressed by Dr. SMITH to the MILITARY SECRETARY, dated Army and Ordnance Medical Department, 11th May 1854.

"These arrangements, to prove equal to the object in view, will involve a liberal supply of ships, some to convey periodically to England men never likely to become available for further service, and also such as are not likely to do so within a reasonable time; others for use in harbours, or for the transport of sick in the event of hospitals being established at a distance from the station of the army, and in a situation that will admit of the sick being conveyed to them by water.

"The ships for the first-mentioned purpose should be commodious steamers, (high between decks, with ample means of ventilation, and fitted with fixed berths) and one should sail whenever the accumulation of sufferers of the description specified should warrant its departure. On ships being supplied, the most important item of the arrangements will have been effected. The other items, which will consist of matters of detail, will require to be provided by the local authorities at the places of embarkation."

(Copy.)

(Immediate.)

Army and Ordnance Medical Department,
27th February 1855.

SIR, As the season of the year is now approaching when sick and wounded may be transferred to England without risk of serious suffering from inclement or severe weather, on approaching the Channel or landing at its ports, I am of opinion that the time has arrived for considering whether it would not be desirable to remove to this country direct from the Crimea, cases of that nature which might safely be subjected to a long voyage. Of the advantage of such a measure we have ample experience in the good effects attending removals of this kind from the East and West Indies, where cases of dysentery and diarrhoea stationary, or disposed to deteriorate as long as the sufferers remain in the country where they have been contracted, derive so much benefit from the sea voyage that the soldier who embarked in these climates a broken-down invalid frequently lands here in comparatively re-established health.

But as it will not be possible to foresee what will be the effect of a prolonged sea voyage in cases of other diseases or wounds, I submit, should the suggestions I now propose be entertained and acted on, that arrangements be made that each vessel conveying sick soldiers should touch at certain intermediate ports, viz., Malta and Gibraltar, in order, should any of the cases on board have become aggravated so as to render their landing desirable, that an opportunity may be thus afforded for effecting this.

Ordinary vessels, it is needless to say, will not be applicable for the removal of the sick to whom I refer, but the conveyances for this purpose must be of the description recommended in my letter of the 11th May 1854, namely, steamers with appropriate fittings.

If it be found expedient to adopt the proceeding of the kind above proposed, I have no doubt but that great benefit will result from it to the sufferers, and another very obvious advantage will be, the facilities which this arrangement will afford for relieving the overcrowded state of the hospitals at Scutari, and in the Crimea.

I have, &c.

Col. Mundy, &c. (Signed) A. SMITH,
War Department. Director-General.

Army and Ordnance Medical Department,
SIR, March 16, 1855.

I HAD the honour of addressing you on the 27th February, on the subject of the removal of sick and wounded from the Crimea, and from the hospitals of the East to this country, by direct conveyance, without their treatment and detention at intermediate ports, except in individual cases where, owing to special circumstances, the continuous prosecution of the voyage might be deemed undesirable.

A medical board composed of the officers named in the margin, all of whom have served at the seat of war, having been lately assembled by my directions to consider certain points in connection with the hospital establishments of the East, and to offer what suggestions or recommendations their local knowledge and experience might enable them to supply, I beg to annex, for the information of Lord Panmure, an extract from the proceedings of this body, strongly confirmatory of the views, I felt it my duty to put forth in the communication to which reference has been made.

Dy. Insp. General.

Dr. Drumbeck.

Dr. Forrest
Mr. Menzies.

Staff-Surgeon
2nd Class.
H. Mapleton.

I have, &c.

Col. Mundy, &c. (Signed) A. SMITH,
War Department. Director-General.

EXTRACT from the RECOMMENDATIONS of a BOARD of MEDICAL OFFICERS assembled at 13, St. James's Place, 8th March 1855.

"3rd. Evacuation of all the hospital establishments to the largest practicable extent.

"4th. To carry out the last recommendation, the removal of the sick and wounded to England would seem most desirable, for reasons too obvious to dwell on; but the beneficial effects of the voyage, the escape from the crowded and polluted hospital, and, in short, the best remedy for nostalgia, a deeply-rooted and widely-spread disease among our enfeebled sick in the hospitals in Turkey, are strong arguments in favour of this measure."

(Immediate.)

Copy.

Army and Ordnance Medical Department,
SIR, June 16, 1855. ¹⁵⁴⁴⁰_{16 F}

I HAVE the honour to acknowledge the receipt of your letter of the 9th instant, enclosing a communication to Lord Panmure of the 21st ultimo, from Lord Wm. Paulet, the commandant at Scutari. I beg, in reference to the matter contained in these documents, earnestly to renew for the consideration of the Minister for War my recommendation that every practicable effort should be made to remove to this country from Scutari all sick not likely to recover soon in the hospitals in which they are being treated.

Cases of cholera are from time to time occurring in these establishments, and should this disease assume an epidemic form, the loss of life will doubtless be very great, from the opportunities it will have of working its ravages on men reduced by previous disease.

A few large transports, if they could at once be made available, would nearly empty the hospitals in the neighbourhood of Constantinople, and the benefit which would accrue to the sick by their removal from these localities at this time would be very great indeed. I believe that many of them, if embarked for England, would even before they reached a port in this country, attain a state of improved health far superior to that which many months hospital treatment in

Turkey would bring about. Further, it is to be hoped that the hospital ships, the "Tasmania" and the "Soldanha," will be appropriated to convey sick and wounded from Balaklava direct to England, and that neither of these vessels will have occasion to

deposit any of the men embarked in the Crimea, either at Scutari, Kulalie, or Abydos.

I have, &c.
Col. Mundy, &c. (Signed) A. SMITH.
War Department.

APPENDIX XLIX.

(Given in by Sir J. Hall, K.C.B.)

MEMORANDUM concerning AMBULANCE CONVEYANCE.

Equipment of a Regiment, Brigade, and Division on Service in the Field.

On the 3rd of August 1854, I submitted to Lord Raglan a detailed statement of what I considered would be necessary for an army of the strength then about to take the field.

This has been printed, which renders it unnecessary to detail the particulars here; but it consisted of 42 waggons and carts, 336 canvas bearers, and 672 men for their use.

On the 2nd of March 1855, I forwarded the following estimate of the probable number of animals that would be required for the ambulance service of the medical department of the army at that time serving in the Crimea:

For one brigade of three regiments, of, say 850 men each = 2,550, there will be required for the conveyance of the surgeons' field panniers:

3 bat animals	3 mules.
For 8 chairs and 4 litters for each regiment	36 "
For long car and cart for each regiment	12 "
For the conveyance of the field panniers of the staff surgeon of the brigade	1 "
For one brigade	52 "

Total for a division of two brigades, 104 regimental.

For divisional reserve store waggons for the conveyance of purveyor's stores, and medical comforts	6
Ditto do. of apothecary's stores, and surgical equipment	6
Two light spring waggons, to carry four men in a recumbent position, 2 mules each	4

Total for a division of 5,100 men 120

There are five divisions of infantry, which on this calculation would require	600 mules
There would be required for the cavalry division	136
For the artillery	136

Total for divisions 872 mules

For the conveyance of the reserve stores—

Ten waggons with six mules in each	60
Two reserve spring waggons	8
Total for whole army	940

There should be a certain number of spare mules to replace any that get sick, or in any other way become non-effective, and I think the estimate for the medical department cannot be made under 1,000 animals.

J. HALL,
Inspector-General of Hospitals.

At a subsequent period this scale was extended to meet the increased strength of the army, and the following scheme was drawn up by me for field service:—

Regimental.

The equipment for a regiment should consist of one long car, drawn by two mules, with a driver mounted, which would convey six men sitting and one reclining, with their packs and arms, and all the spare medicines and surgical materials in the drawers of the well, besides four canvas bearers.

One cart, with two mules, to convey the hospital marquee; two bell tents; medical comforts; A and B canteens; fracture box, and spare mule chairs and litters, two pairs of each; a mule with a packsaddle, for the surgeon's medicine panniers, to which either chairs or litters could be attached in place of the panniers in case of necessity; a packsaddle of the same kind, and mule, for the waterskins; one mule with packsaddle and pair of litters, and another with a packsaddle and pair of chairs, making a total of one long car for sick or wounded; one car for the conveyance of stores, and eight mules, which, on an emergency, would remove 19 sick or wounded, or convey on the line of march 11 sick or wounded, the surgeon's panniers, 15 cwt. of stores and equipment, and a pair of water-bags.

There would be required for the conveyance of the divisional stores:—

Two covered waggons, similar to what are called bread waggons, for the conveyance of medicines.

Two of the same kind of waggons for medical comforts; both sets to be secured with good strong padlocks.

Divisional.

Four store waggons for divisional hospital stores and equipment, which would make the full equipment for a division of 10,000 men, taking the field, to consist of:—

Mules.

13 To carry 13 pairs of surgeons' panniers, with packsaddles complete.	
13 To carry 13 pairs of water-skins.	
26 For 13 Irish cars to accompany regiments, to carry six men each, wounded or sick	78
26 For 13 regimental store carts.	
48 For 12 waggons, with India-rubber springs, Fuller's improved, to carry eight sick or wounded men each	96
13 For 13 Maltese carts, fitted with two spring cots in each	26
100 For 100 pairs of mule chairs	200
50 For 50 pairs of mule litters	100
32 For 8 divisional store waggons.	

321 Mules. Conveyance for sick or wounded 500

The *personnel* of the ambulance, I think, ought to be placed under the command of the director-general of the military train. Each regiment and division on

service should have a fixed amount of ambulance conveyance at all times attached to it. The regimental to be at the disposal of the surgeon, the divisional at that of the principal medical officer of the division, and the whole to be at the disposal of the principal medical officer of the army, should occasion require it. But from my observation and experience, the care of the animals, and the discipline of the men attached to them, should be under the orders of the director general of the field train.

Brigade.

If a brigade were detached, one of the divisional covered store waggons for medicines and medical comforts, and a waggon for other stores, would be required to accompany it, in addition to the regimental equipment of individual regiments.

The medical equipment of a regiment in front of the enemy should consist of—

One hospital marquee, weight	lbs. 400	} To be conveyed in store cart.
Two bell tents - - -	140	
Twenty cork mattresses -	100	
Twenty blankets - - -	80	
20 rugs - - - - -	80	
20 waterproof blankets -	85	
A. and B. canteens - - -	160	
Box of fracture apparatus -	35	
One spade, one pickaxe, one handsaw, one axe, and two water buckets -	32	
Six canvas bearers - - -	84	
Medical comforts, as detailed in list - - -	180	
Spare packsaddles and litters - - - - -	108	
	<u>1,484</u>	

Detail of Medical Comforts for a Regiment to take with it into the Field, the Commissariat furnishing the ordinary Ration of Bread and Meat, &c. :

8 bottles of brandy.	} Packed in a box with divisions, secured with a lock, and conveyed in the store cart.
12 ditto of wine.	
5 lbs. of tea.	} Packed in canisters with hinged tops, and fitted into a canteen.
10 lbs. of arrow-root.	
12 lbs. of rice or barley.	
14 lbs. of sugar.	
50 $\frac{1}{4}$ pints of essence of beef.	} To be packed in a box and conveyed in the store cart.
24 tins of cocoa and milk.	
4 lbs. of desiccated milk.	
7 lbs. of salt in a stone jar.	
1 lb. of ground pepper in a bottle.	
8 oz. of mustard in a bottle.	
12 lbs. of dried and compressed vegetables.	
10 lbs. of candles.	

One lamp, with reflector, fitted in its own case and carried in store cart.

Knife for opening tins of preserved meat or essence of beef, &c.

Estimated weight to be conveyed in the Irish car :—	
4 canvas bearers - - - - -	56 lbs.
7 knapsacks complete - - - -	392
7 men - - - - -	980
Articles packed in drawers of the well of the car - - - - -	56
	<u>1,484 lbs.</u>

In addition to the regimental equipment, there should be a reserve divisional establishment, capable of receiving 100 patients, which would require an equipment of—

5 hospital marquees,
3 bell tents,
100 cork mattresses,
100 blankets,
100 rugs,
100 waterproof shirts,
100 night caps,
1 coloured signal lantern, 5 ward lamps with burners for double wicks, 6 lbs. of cotton wick, can of oil, and feeder for trimming lamps ; 1 hand lamp, 1 lamp with reflector for operations at night, 2 punched lanterns, 2 candlesticks with snuffers chained, 100 tin plates, 112 pint tin cups, 100 knives and forks, common ; 6 carvers, 100 iron spoons, 2 flanders kettles, 2 nests of saucepans, tin, 8, 6, 4, 3, 1 quarts, and 1 of 3-pints ; 2 tin tea kettles, 4-quarts each ; 6 tin meat dishes, 13 $\frac{1}{2}$ inches ; 2 frying pans, 2 flesh forks, 2 soup ladles, 24 chamber pots, 12 bed pans, 12 stool pans with frames for same, 12 urinals, 12 spitting pots, 12 wash-hand basins, 2 axes, 2 meat choppers, 1 handsaw, 24 hand towels, 12 jack towels, 1 folding bath, 18 yards huckaback, 12 yards of flannel, 24 boxes of matches, set of diet scales and weights, 2 claw hammers, one large and one small ; 1,000 nails assorted ; 4 hasps, staples, and padlocks ; 12 bearers for wounded men ; 6 water decks, 2 shovels, 2 spades, 2 pickaxes, 6 water buckets, 1 water skin, 1 set of oil measures, 1 ditto for wine.

Medical Comforts.

12 dozen of wine,
6 do. of brandy,
56 lbs. of arrow-root,
56 lbs. of tea,
56 lbs. of candles,
56 lbs. of soap,
56 lbs. of barley or rice,
112 lbs. of sugar,
112 lbs. of preserved potatoes,
112 lbs. of preserved meat, and knife to open tins with.
75 lbs. in $\frac{1}{4}$ -pound tins of essence of beef,
50 tins of cocoa and milk,
20 lbs. of desiccated milk.
56 lbs. of dried and compressed vegetables.
28 lbs. of salt.
5 lbs. of ground pepper.
5 lbs. of ground mustard, weighing 1,611 lbs. in the whole.

The Divisional supply of medicine would be tedious to detail, but the invoice of the divisional medicine waggon, with some few alterations, would answer very well, as it contains all that is necessary, and some articles that are not much used in field hospitals.

JOHN HALL,
Inspector-General of Hospitals.

APPENDIX L.

(Given in by T. Alexander, Esq., C.B.)

TRANSPORT FOR HOSPITAL FIELD EQUIPMENT, COMFORTS, MATERIALS, MEDICINES, &c.

Each battalion, brigade, and division should be so far complete in themselves that on any sudden march it would be known what amount of transport each would be entitled to, and which ought to be supplied at once to the medical officer of either the battalion,

brigade, or division, on his signature. Should it so happen that the medical officer in charge of either the battalion or brigade required more transport than what is laid down, the approving signature of the principal medical officer of the division would be necessary.

Each battalion should have the following transport to enable a certain amount of field hospital equipment and some comforts and medicines to be carried with it, say for 14 days:—

For a battalion 850 strong—

Medical panniers	-	-	1 mule.
Cart for hospital equipment, &c.	-	2	"
Ambulance car to follow in the rear of the battalion for men falling out on the march, and also to carry 14 stretchers, a water barrel, and light operating table (portable)	2		"
			5 mules.

The panniers ought to be larger than those now in use, so that they would be a fair load for a mule. They should be made with trays, not drawers.

Cart to carry—

One hospital marquee	-	-	400 lbs.
One bell tent	-	-	69 "
20 blankets	-	-	80 "
20 waterproof covers	-	-	60 "
20 palliasses and bolster cases	-	}	160 "
20 pairs of sheets or 20 blankets	-		
4 cork beds	-	-	31 "
6 reaping hooks	-	-	9 "
Fracture apparatus box	-	-	39 "
A. and B. canteens	-	-	160 "
Spade, pickaxe, saw, axe, 2 water buckets	-	-	32 "

1,040 lbs.

Also medical comforts, viz.—

Arrowroot	-	-	14 "
Tea	-	-	5 "
Sugar	-	-	10 "
Case, 6 bottles wine	-	-	42 "
6 bottles brandy (locked)	-	-	
Tins, essence of beef	-	-	20 "
Candles, sperm or wax	-	-	8 "
Pepper	-	-	2 "
Mustard	-	-	1 "
Salt	-	-	5 "
Soap	-	-	5 "
Preserved mixed vegetables	-	-	5 "

1,157 lbs.

Total, mules for the above - 5;
besides carrying 6 or 8 sick.

The surgeon should be held responsible that on moving he has always on hand such a supply as the above, which would enable him at once to provide a hospital establishment for the comfort of the sick; if not before moving, it would be his duty to make up any deficiencies in the above, and which ought to be obtained from the divisional stores by his own signature.

In the event of requiring more ambulances for his battalion, &c., the approving signature of the divisional principal medical officer would be necessary, and it would be that officer's duty to grant the amount he deemed requisite.

DIVISIONAL SUPPLY for SIX REGIMENTS=5,000 Men.

Each division ought to have, if possible, always at hand (in addition to the regimental supplies), a supply of comforts, materials, and medicines, also of hospital stores, as below enumerated, and transport for the conveyance of the same, viz.—

2 sets medical panniers, one for each brigade	2		mules.
2 large waggons for hospital stores, &c., drawn by four horses or mules, or four carts each drawn by two horses or mules	8		"
2 carts drawn by 2 horses or mules for comforts, materials, medicines, &c.	4		"

Total - 14 mules.

2 large waggons, or four carts, to carry as follows—

2 hospital marquees	-	-	-	800 lbs.
2 bell tents	-	-	-	138
100 blankets	-	-	-	400
100 waterproof covers	-	-	-	300
100 palliasses and bolster cases	-	-	-	800
100 pairs of sheets or 100 blankets	-	-	-	
12 reaping hooks	-	-	-	18
16 cork beds	-	-	-	122
12 stretchers	-	-	-	168
2 spades, 2 pickaxes	-	-	-	64
2 saws, 2 axes, 4 water-buckets	-	-	-	

Total - 2,810 lbs.

Also, 4 large tea-kettles, 4 large camp kettles, 4 light iron triangles, 100 drinking tins, 100 tin plates, 100 knives and forks, 100 spoons (table), 4 tin meat dishes, 2 carving knives and forks, 2 ladles, 2 flesh forks, 2 meat choppers, 2 meat saws, 4 frying pans, 2 nests saucepans (various sizes), 2 set measures from $\frac{1}{4}$ pint to 1 quart, 2 sets weights from $\frac{1}{4}$ ounce to 7 pounds, 2 water-barrels, 2 hammers, 2 corkscrews, 2 knives for opening tins of essence of beef, 48 towels, 8 washhand basins, 4 lanterns, 2 coloured do., 8 candlesticks and snuffers, 4 oil lamps, 2 tin cans of oil, wick 8 pounds, 12 urinals, 12 bed-pans, 16 chamber-pots, 8 close-stool pans and frames, 24 spitting cups, 8 bleeding cups, 2 light operating tables (portable).

The two carts drawn by two horses or mules, each to carry say 1,000 lbs. medical comforts, 1,200 lbs. materials, instruments, &c., and from 2 to 300 lbs. of the most requisite medical comforts, viz.—

Essence of beef	-	-	-	100 lbs.
Arrowroot	-	-	-	100
Tea	-	-	-	60
Sugar	-	-	-	60
6 dozen bottles of wine	-	-	-	504
6 dozen bottles of brandy (locked)	-	-	-	
Preserved mixed vegetables	-	-	-	50
Candles, sperm or wax	-	-	-	60
Mustard	-	-	-	6
Pepper	-	-	-	6
Salt	-	-	-	20
Soap	-	-	-	40

1,006 lbs.

The foregoing scales of comforts are estimated on the understanding that the usual rations can be drawn from the Commissariat.

1,200 lbs. of materials, viz. :—

Bandages, tow, lint, splints for upper extremity, for lower do., long straight wooden, pasteboard for splints, gutta percha for do., Luke's fracture apparatus, cradles, stump pillows, air pillows, arm slings, oil silk, oil cloth, gutta percha sheeting, adhesive plaster, isinglass do., ligature thread, needles, sponges, flannel for fomentations, old sheets, shirts, capital instruments, stomach pumps, patent enema syringes, tracheotomy tubes (large size), chain saws, Liston's lion forceps, Liston's bone ditto, Assalini's forceps, cupping instruments, post-mortem cases, counter-scissors, tape pieces, pins, paper.

Also from 2 to 300 lbs. of the most requisite medicines.

A brigade of three regiments, 2,500 men, if detached, would be supplied with one-half the transport and hospital field equipment, materials, comforts, medicines, &c., of the divisional supply above stated, and on other occasions in proportion to the strength, on the above scale.

RECAPITULATION of TRANSPORT requisite for the Conveyance of the above Field Hospital Equipment, Comforts, Materials, Medicines, Instruments, &c., as well as the Number of Sick that can be carried by the same by Battalion, Brigade, and Division.

For a battalion of 850 men.

Medical panniers	-	-	-	1 mule.
Cart for hospital stores, comforts, &c.	-	2	„	
Ambulance car to follow in rear of the battalion, and capable of carrying 6 or 8 sick	-	2	„	
				5 mules.

Brigade of 3 regiments = 2,500, if detached, including regimental transport.

One large waggon for hospital stores, &c.	-	4 mules.
or two carts drawn by two mules each	-	
One cart for comforts and materials	-	2 „
Medical panniers for brigade medical officer	-	1 „
Three carts for hospital stores, comforts (one for each regiment)	-	6 „
Medical panniers (one for each regiment)	-	3 „
Three ambulance cars (one for each regiment), and capable of carrying 18 or 24 sick	-	6 „

Total - - - 22 mules,

would carry half of the hospital equipment laid down for the division, with 500 lbs. of comforts, 600 lbs. of materials, and 150 lbs. of the most requisite medicines; also 18 or 24 sick.

Division of 6 regiments = 5,000.

Two large waggons for hospital stores, &c., each drawn by four horses or mules, or four carts, each drawn by two horses or mules	-	8 mules.
Two carts for comforts, materials, medicines, &c., each drawn by two horses or mules	-	4 „
Two sets of medical panniers (one for each brigade)	-	2 „
Six carts for hospital stores, comforts, &c., one for each battalion	-	12 „
Six ambulance cars (one for each battalion), and capable of carrying 36 or 48 sick	-	12 „
Six sets of panniers (one for each regiment)	-	6 „

In addition to the above stores, 36 or 48 sick could be carried by - - - 44 mules.

Ambulances should be forthcoming when requisite in the proportion of 5 per cent. of strength; one-half might be conveyed on wheeled carriages, and the other half in cacolets or litters, viz.—

5 per cent. sick in 5,000 = 250.

16 carts drawn by 2 mules each,	-	128 sick=32 mules.
8 sick each	-	
61 pairs of cacolets or litters, 1 mule for 2 sick	-	122 „ =61 „
Sick 250, carried by 93 mules.		

When stationary were the 44 mules forthcoming for the services of the division, allowing those for

the panniers to be employed daily in bringing water, wood, &c., for the hospitals, there would remain 36 mules for the transport of sick, &c.; and they might be employed, when requisite, as follows:—

6 Regimental ambulance cars	-	-	= 12 mules = 48 sick.
12 other ambulance cars	= 24	„	= 96 „

or,— 36 mules = 14 sick.

6 Regimental ambulance cars	-	= 12 mules = 36 or 48 sick.
20 pairs of cacolets or litters	-	= 20 „ = 40 or 40 „
2 carts, for knapsacks of men, carried on mules backs, per cacolets	-	= 4 „ —

36 mules = 76 or 88 sick,

whether the ambulance cars carried 6 or 8 sick each; also according to the state of the roads.

All cacolets or litters should (as the French) be removable from the pack-saddles, so that on their return to camp, after conveying the sick to the rear, hospital stores, comforts, &c., might be conveyed by the same mules; the cacolets having been placed in carts, or on so many mules.

At head-quarters there should always, if possible, be on hand a supply of medicines, comforts, materials, and hospital field equipment, for about three months, with waggons for the conveyance of the same, should a move take place.

A smaller supply than the above might be sufficient, were there certain and rapid means of replacing head-quarter stores.

Hospital ships for the conveyance of sick, and as receiving ships, would also be necessary; the latter might be used also as store ships for hospital supplies.

Hospital staff corps men would be supplied to act as hospital orderlies, cooks, servants, and batmen to medical officers. A dispenser to be in charge of the medicines and materials; and a purveyors' clerk in charge of the hospital stores and comforts, with an hospital staff corps man to each, to assist in issuing.

All packages or boxes for an army in the field should be so arranged that two of either would form a fair load for a pack mule or horse; the above, although apparently very trifling, would be found in practice to be very beneficial, as the boxes or bales could at once be moved by pack mules or horses.

Timely notice of any movement of troops ought invariably to be communicated to the principal medical officer of the army in the field, by the military authorities, so that proper arrangements may be made for the comfort of the sick and wounded.

Officers commanding divisions ought also to inform the principal medical officer of the division of any movements about to take place, that the proper arrangements may be made.

The above is the minimum of transport compatible with efficiency, capable of expansion but not of contraction, and drawn up with reference, not merely to the wants of the medical department, but to facility of transport with an army moving in the field, and to the numerous requirements of other branches of the service, transport for which must be supplied as well as for the medical.

T. ALEXANDER,
Inspector-General of Hospitals.

APPENDIX LI.

RETURN showing the AVERAGE STRENGTH and the DEATHS in each Year from 1839 to 1853 of the Officers, Non-Commissioned Officers, and Men serving in the Army, exclusive of West India and Colonial Corps.

Years.	Cavalry, Guards, and Infantry, exclusive of West India and Colonial Corps.			
	Officers.		Non-commissioned Officers and Men.	
	Establishment.	Total Deaths.	Effectives. Average Strength.	Total Deaths.

Royal Marine Office, }
6th August 1857. }

J. R. M. WESLEY, D.A.G., R.M.

APPENDIX LV.

(Prepared from the War Office Annual Returns.)

TABLE showing the STRENGTH of the HOUSEHOLD BRIGADE and of the CAVALRY and INFANTRY of the LINE serving in the United Kingdom, and the Deaths, in each Year from 1st April 1839 to 31st March 1854.

YEARS.	Household Cavalry.		Cavalry of the Line.		Foot Guards.		Infantry of the Line.	
	Strength on 1st April of each Year.	Died in each Year.	Strength on 1st April of each Year.	Died in each Year.	Strength on 1st April of each Year.	Died in each Year.	Strength on 1st April of each Year.	Died in each Year.
1839	1,214	15	5,267	79	3,234	66	14,417	257
1840	1,206	10	5,330	62	3,246	67	9,377,	182
1841	1,219	14	5,308	76	3,180	57	12,278	199
1842	1,212	14	4,660	71	3,227	56	13,584	212
1843	1,205	14	5,335	72	4,879	97	19,945	321
1844	1,199	13	6,225	67	4,996	112	24,845	443
1845	1,207	10	5,864	72	4,931	118	21,946	362
1846	1,203	11	5,483	77	4,915	86	18,679	403
1847	1,211	11	5,827	81	4,777	91	22,389	492
1848	1,206	21	6,204	78	4,932	90	27,156	468
1849	1,213	20	6,523	114	4,987	125	33,745	638
1850	1,209	11	6,525	71	4,958	85	25,695	328
1851	1,208	13	6,177	79	4,950	95	22,570	348
1852	1,209	9	6,241	89	4,942	89	23,534	304
1853	1,193	8	6,160	63	4,951	72	18,249	240
Total for 15 years	18,114	194	87,129	1,161	67,105	1,306	308,409	5,197
Annual ratio per 1,000 of strength -		10·7		13·3		19·5		16·8

Note.—To prevent as far as possible the results being affected by the deaths of men returning in bad health from foreign service with their regiments, no corps has been included in this table till it had been at least six months at home, during which period most of that class are likely to have died or been discharged. It has also been found necessary to omit such regiments as had Reserve Battalions serving abroad.

APPENDIX LVI.

(Prepared by the Secretary.)

TABLE showing the GENERAL RESULTS of the five preceding Numbers of Appendix.

APPENDIX LVIII.

(Prepared by the Secretary.)

MEMORANDUM on the EXTENT of INVALIDING in the ARMY as tending to diminish the RATE of MORTALITY.

The results obtained from returns of the strength and deaths in the army during any given period do not fairly represent the loss arising from military service. They merely show the mortality while the men remain in the army; but many die, after being discharged, of diseases previously contracted, and these deaths, though resulting from service, are not included in the military returns. If all the men discharged as invalids were placed on the pension list the amount of mortality might possibly be ascertained, but some receive no pension, and are lost sight of from the date of leaving the army; others receive temporary or conditional pensions for short periods, and cannot be traced after these have expired. An approximation to the amount may, however, be obtained by ascertaining the deaths among pensioners during the first twelve months after their discharge, and comparing them with the mortality of the regiments from which they had been invalided, when any mortality above the average may be considered attributable to the diseases for which they were discharged. As by this mode of investigation the men are kept under observation for a year after their discharge, while their place in the regiment has been supplied by fresh men, the number pensioned must be added to the strength of the troops before calculating the ratio of mortality from the combined observations. This has accordingly been done in the following summary, showing the mortality among the troops serving at home during the nine years 1845-53, for which period only the returns of the mortality among the pensioners are available:—

Nine Years, 1845-53.	Troops serving in the United Kingdom.			Total placed on Pension List.	Of whom died within 12 months.	Strength of men serving and pen- sioned.	Of whom died.	Ratio of Deaths per 1,000 of strength.	Increase.
	Aggregate Strength.	Total Deaths.	Rate of Deaths per 1,000.						
Household Cavalry.	10,819	114	10·5	360	45	11,179	159	14·2	3·7
Cavalry of the Line.	55,004	724	13·2	1,757	140	56,761	864	15·2	2·0
Foot Guards.	44,343	851	19·2	1,565	210	45,908	1,061	23·1	3·9
Infantry of the Line.	204,650	3,425	16·7	6,767	536	211,417	3,961	18·7	2·0
Royal Horse Artillery.	6,031	70	11·6	273	12	6,304	82	13·0	1·4

From this it appears that the addition which must be made to the mortality to obtain an accurate estimate of the influence of military service on troops in the United Kingdom varies from 1·4 per 1,000 in the horse artillery to 3·9 per 1,000 in the foot guards. The foot artillery and sappers and miners have been omitted, as there are no means of distinguishing between the men pensioned from companies on foreign service and at home.

It will be observed in the preceding summary that the rate of mortality among the pensioners does not bear any relative proportion to that of the force to which they had previously belonged. Thus it is very

nearly the same among those from the household cavalry and the foot guards, though the ratio among the men while serving in the former is the lowest, and in the latter the highest of any class of troops in the United Kingdom; and in like manner the mortality among the pensioners from the cavalry and infantry of the line is the same, although the ratio of the latter while serving is considerably in excess of the former. The higher rates of mortality among the pensioners from the household troops may probably arise partly from their greater facilities of invaliding, and partly from a larger proportion of them, as compared with the line, residing in London after their discharge.

If the same mode of calculation be applied to the army generally, serving both at home and abroad, we ascertain the average annual loss arising from military service to be as follows:—

Nine Years, 1845-53.	Aggre- gate Strength.	Total Deaths.	Ratio of Deaths per 1,000 of strength.	Total number placed on pen- sion list.	Of whom died within twelve months.	Total strength of men serving and pensioned.	Total deaths among these.	Ratio of deaths per 1,000 of strength.
Cavalry, Guards, and In- fantry, exclusive of West India and Colonial Corps - -	1,091,389	33,569	30·7	29,057	2,255	1,120,446	35,824	32·0
Royal Artillery - -	86,600	1,520	17·5	2,214	133	88,814	1,653	18·6
Royal Sappers and miners -	16,469	275	16·7	402	25	16,871	300	17·8

Thus it appears that the total mortality arising from military service amounts to 32 per 1,000 in the army generally, 18·6 per 1,000 in the artillery, and 17·8 per 1,000 in the sappers and miners. The addition to be made on account of the deaths among the pensioners is less than for the troops serving in the United Kingdom. This evidently arises from the circumstance that on foreign service, after having been selected for discharge, a considerable time elapses before the man reaches home, and he is then kept at least a month under observation at Chatham, and if his death occurs during that period it is entered in the regimental returns. In the United Kingdom, on the other hand, the man is at once sent to Chatham for observation, and in the household brigade even that is dispensed with, the invalid being discharged after his case has been verified by the staff surgeon of the district and the physician of Chelsea Hospital. Thus in chronic cases, there is much less chance of the man dying before he is discharged than when he has to be sent home from some distant colony.

But there is another important question besides that of mortality connected with invaliding. To what extent does it operate upon the effective strength of the army? If the term "invaliding" had been applied only to the discharge of such men as were deemed unfit for military service in consequence of disease or physical disability contracted in and by the

service, this could have been easily ascertained. But owing to the peculiar constitution of the British army it has a more extended meaning. Prior to the passing of the Limited Enlistment Act in 1847, all recruits for the army were attested for "unlimited service," or in other words, they engaged to serve for life, or till they were legally discharged. No soldier therefore could demand his discharge as a matter of right after any length of service. A certain number were granted their discharges annually as an indulgence, and on a modified rate of pension, but, except in case of a reduction of the army, the great majority were discharged as invalids, being reported by the medical officers unfit for further service. Although by regulation men could be compelled to remain in the army up to any age, practically very few were retained after 24 years' service in cavalry or 21 in infantry. These periods were probably adopted as being the same which were fixed by Mr. Wyndham's Act in 1806 as entitling a soldier to claim his discharge. To have completed this service the soldier must usually have attained the age of 43 in the one service and 40 in the other, and has probably lost that activity and energy which is so necessary to the efficient discharge of military duty. In forming any estimate of the influence of invaliding upon the effective strength of the army this class should therefore be omitted, as they may be fairly deemed *emeriti*, and to have been discharged rather for length of service than for the disability which, in compliance with the pension regulations, it was necessary to assign as the reason of their discharge.

With regard to the others who may strictly be termed "invalids," it is of importance to ascertain whether they have become disabled at an early period of their career, or after having served for a considerable portion of that period which seems to be deemed a fair length of military service. This is interesting in a financial point of view, as the loss of a young soldier involves a considerable expense to replace him, while at a later period the preliminary expenses of raising and training him are supposed to have been compensated by the service he has performed. It is also interesting as illustrative of the wear and tear of military service. As the number of men discharged after certain periods must vary in a great measure according to the proportion serving at these periods, it has been necessary, with a view to forming an accurate comparison, to ascertain the relative numbers, which has accordingly been done, and will be found in Returns 3 and 4, annexed, from which the table in the next column has been compiled:—

—	Under 7 years' service.	7 to 14 years' service.	14 to 21 in Infantry or 24 in Cavalry.	Total under 21 or 24 years' service.	Above 21 or 24 years' service.
Household Cavalry.					
Strength - -	8,332	4,988	4,188	17,508	606
Invalided - -	52	68	147	267	322
Ratio invalided per 1,000 serving - -	6·2	13·6	35·1	15·2	531·3
Cavalry of the Line.					
Strength - -	48,541	21,721	15,453	85,715	1,414
Invalided - -	713	510	568	1,791	1,045
Ratio invalided per 1,000 serving - -	14·7	23·5	36·7	20·9	739·0
Foot Guards.					
Strength - -	36,761	20,731	12,707	70,199	3,521
Invalided - -	526	335	254	1,115	1,167
Ratio invalided per 1,000 serving - -	14·3	16·1	20·0	15·9	331·4
Infantry of the Line.					
Strength - -	195,628	70,549	39,097	305,274	3,135
Invalided - -	3,105	1,486	2,174	6,765	3,094
Ratio invalided per 1,000 serving - -	15·9	21·1	55·6	20·8	987·0

It must be recollected in reading the above table, that the figures in the fourth column represent not a body of men consisting of the numbers therein set down, but an aggregate of a small number maintained, though at a decreasing strength, by the retention of the uninvalided men and the annual introduction of recruits, for a period of 21 years in the infantry and 24 in the cavalry, upon which the average annual invaliding would be at the rate of 20·8 per 1,000 for the infantry of the line.

From this table it appears that the numbers annually discharged by invaliding under 21 years' service range from 15·2 per 1,000 in the household cavalry to 20·9 in the cavalry of the line; and including those who have served 21 years and upwards it reaches 32·5 per 1,000 in the cavalry, and 31·9 per 1,000 in the infantry of the line. In the invaliding under 21 and 24 years' service there is the same peculiarity observed as in the mortality among the pensioners, that the ratios correspond very closely in the household cavalry and foot guards, and in the cavalry and infantry of the line; but there is this marked distinction, that the invaliding is in excess in the line, while the mortality preponderated in the household brigade.

1. RETURN showing the Number of Men discharged to Pension from each Arm of the Service, in each of the Nine Years 1845-1853, and the Number of these Men who died within Twelve Months from the Date of their being placed on the Pension List.

APPENDIX LX.

(Given in by Sir A. M. Tulloch, K.C.B.)

MORTALITY in the ARMY at HOME, as compared with the Civil Population at the same Ages. Extracted from the "Statistical Report on Sickness, Mortality, and Invaliding among Troops in the United Kingdom," presented to Parliament in 1853, page 7.

In the Fifth Report of the Registrar General, an abstract is given of the fatal diseases or causes of death in 1840, at different periods of life, among the population of 24 English towns, in most of which troops are quartered ; and from the census of 1841 we have obtained the numbers living at each of these ages in the same towns. We possess, in like manner, the ages of the dragoon guards and dragoons, in abstract No. VIII. of Appendix, of which the following is a summary :

Under 20.	20 to 30.	30 to 40.	40 and upwards.	Total of all Ages.
5,536	29,354	13,834	3,598	52,322

From this it appears that a very small proportion, amounting only to about one-sixth of these troops, are either under 20 or above 40 ; so that, for all practical purposes, the whole may be considered as between these two ages. To complete our comparison, therefore, upon a tolerably fair basis, it is only necessary to ascertain how many of the civil population would have died, by each class of diseases, had the numbers living been 29,354 between the ages of 20 and 30, and 13,834 between the ages of 30 and 40 ; the sum of these reduced to ratios per thousand of the strength will furnish the information required.

This has accordingly been done in abstract No. 2 of Appendix, where all the details will be found, and from which the following table has been framed.

	Ratio of Deaths per 1,000 of mean strength.	
	Among Dragoon Guards and Dragoons.	Among a Town Population at the same period of life.
By fevers - - -	1·4	1·2
„ eruptive fevers - - -	0·1	0·3
„ diseases of the lungs - - -	7·3	6·3
„ diseases of the liver - - -	0·3	0·2
„ diseases of stomach and bowels - - -	0·4	0·4
„ diseases of the brain - - -	0·8	0·6
„ dropsies - - -	0·5	0·4
„ all other diseases - - -	1·6	1·2
„ sudden and violent deaths, &c. - - -	1·2	1·3
Total - - -	13·6	11·9

These results show a very remarkable coincidence, not only in the relative mortality of soldiers and civilians, but also in the proportion of deaths by each class of diseases. Indeed, with the exception of pulmonary affections, the difference will be found so slight as scarcely to deserve notice. The deaths by fever among the military exceed those of the civil population by only 2 in every 10,000 men, but they enjoy an exemption from eruptive fevers to exactly the same amount. The care taken to ascertain whether recruits have undergone vaccination, and, if not, to have it immediately performed, will sufficiently account for this exemption.

Diseases of the lungs are obviously the chief source of mortality, at the above ages, both in and out of the army; but the deaths from them are greater among soldiers than civilians in the proportion of 7·3 to 6·3.

In diseases of the liver and brain, and those classed under the head of "other diseases," there is a trifling preponderance among the military; while in those of the stomach and bowels, and in dropsies, the proportion is exactly the same in both.

It is remarkable that the ratio of deaths from accidents, violence, and suicide, is almost the same both among civil and military.

APPENDIX LXI.

(Given in by Sir A. M. Tulloch, K.C.B.)

1. RETURN showing the RATIO of MORTALITY per THOUSAND, of the Strength at the under-mentioned Periods of Life among the Non-commissioned Officers and Privates of White Troops serving at the following Stations, from 1st January 1830 to 31st March 1837.

STATIONS.	Under 18.*	18 to 25.	25 to 33.	33 to 40.	40 to 50.	Average of all ages.	REMARKS.
Household Cavalry	8·4	14·7	11·4	16·3	22·8	14·5	* No correct deductions can be drawn from the ratios under 18, as the numbers are so few and the results consequently irregular.
Cavalry of Line - -	4·4	13·9	14·	17·3	26·7	15·3	
Foot Guards - -	6·1	22·3	22·5	17·7	27·5	21·6	
Gibraltar - - -	10·	18·7	23·6	29·5	34·4	22·3	
Malta - - -	16·	13·	23·3	34·	56·7	22·3	
Ionian Islands - -	6·6	12·2	20·1	24·4	24·2	19·3

SCALE SHEWING THE RELATIVE DEGREE OF MORTALITY BY FEVER BEFORE AND SINCE 1837 AMONG THE TROOPS IN THE UNDERMENTIONED COLONIES.

SCALE SHEWING THE RELATIVE DEGREE OF MORTALITY BY DISEASES OF THE LUNGS, BEFORE AND SINCE 1837, AMONG THE TROOPS IN THE UNDERMENTIONED COLONIES.

SCALE SHEWING THE RELATIVE DEGREE OF MORTALITY BY DISEASES OF THE LIVER, BEFORE AND SINCE 1837, AMONG THE TROOPS IN THE UNDERMENTIONED COLONIES.

SCALE SHEWING THE RELATIVE DEGREE OF MORTALITY BY DISEASES OF THE STOMACH AND BOWELS BEFORE AND SINCE 1837 AMONG THE TROOPS IN THE UNDERMENTIONED COLONIES.

SCALE, SHEWING THE RELATIVE DEGREE OF MORTALITY BY EPIDEMIC CHOLERA, BEFORE AND SINCE 1837, AMONG THE TROOPS IN THE UNDERMENTIONED COLONIES.

No Deaths
by Cholera are recorded before or Since 1837
as having occurred among the Troops stationed
at.
The Cape of Good Hope Van Diemens Land
Saint Helena or
Bermudas New Zealand

SCALE SHEWING THE RELATIVE DEGREE OF MORTALITY BY DISEASES OF THE BRAIN, BEFORE AND SINCE 1837, AMONG THE TROOPS IN THE UNDERMENTIONED COLONIES.

APPENDIX LXIII.

(Given in by Sir A. M. Tulloch, K.C.B.)

TABLE showing the Ratio of Mortality among the Negro Slave Population in each of the West India Colonies during the undermentioned Periods, compared with that of the Black Troops. Extracted from "Appendix to Report on the Sickness, Mortality, and Invaliding among the Troops serving in the West Indies," presented to Parliament in 1838 (page 6).

COLONIES.	Period over which the Average has been taken.	Average Population.			Average Yearly Deaths.			Annual Deaths to 1,000 Living.			Ratio of Deaths of 1,000 Black Troops, 1817-36.

APPENDIX LXIV.

(Given in by Dr. Balfour with reference to Qu. 9549-50.)

RESULTS of SANITARY IMPROVEMENTS in the TOWER of LONDON on the HEALTH of the GUARDS quartered there.

With a view to estimate the influence of the various improvements in the Tower of London upon the health of the Guards quartered there, the following statement has been prepared, showing, for three different periods, the amount of sickness and mortality among them, and likewise the relative prevalence of certain diseases which were the most likely to be produced by the neglect of sanitary measures.

The subjects adverted to in the answers to questions 9549-50, were the state of the ditch, the supply of water, and the defective barrack accommodation.

The Tower ditch was drained and converted into a dry ditch in the summer of 1843. The new barracks were occupied by four companies in November 1848, and the remaining companies were accommodated in them in the end of September 1849. At the latter date also the supply of drinking water from the river was

stopped, and has since been obtained from an artesian well at the Mint.

These dates enable us to divide the fifteen years from April 1839 to March 1854 into three periods.

1st. From April 1839 to September 1843, during which time the troops were exposed to the emanation from the tidal ditch into which the drains of the Tower emptied their contents.

2nd. From October 1843 till September 1849, after the ditch had been dried, but while the troops were still quartered in the old and badly-constructed barracks, and supplied with water from the river.

3rd. From October 1849 till February 1854, during which period the men occupied the new barrack, and were furnished with water of excellent quality for cooking and drinking.

The following Table shows the state of health of the Foot Guards quartered in the Tower during these periods :—

Period.	Aggre- gate Monthly Strength.	Giving an annual Strength of	Admissions into Hospital by				Deaths by			
			Contd. Fever.	Typhus.	Diarrhea.	All Diseases.	Contd. Fever.	Typhus.	Diarrhea.	All Diseases.
1st April 1839 to } 54 Ms. 30th Sept. 1843	30,019	2,502	118	150	265	2,253	2	10	—	49
1st Oct. 1843 to } 72 Ms. 30th Sept. 1849	47,111	3,926	310	58	372	3,302	—	12	—	77
1st Oct. 1849 to } 53 Ms. 28th Feb. 1854.	36,337	3,028	171	8	252	2,424	2	7	—	48
Annual Ratio per 1,000 of Strength :										
1st Period - - -			47·16	59·95	105·9	900·5	·8	4·	—	19·58
2nd " - - -			78·96	14·77	94·7	841·1	—	3·1	—	*19·61
3rd " - - -			56·47	2·64	83·2	800·5	·7	2·3	—	15·85

* This includes the epidemic cholera of 1849.

The results shown in this table are very remarkable. As regards fevers, the effect produced by the draining of the ditch was shown rather in a change of the type than in a very great reduction of their prevalence; but that change of type was attended with a marked diminution in their fatal character. The improved barrack accommodation, on the other hand, was followed by a great reduction in the amount, but a very slight effect on the already diminished mortality. This will be seen at a glance in the following table :—

	Ratio per 1,000.	Admissions.	Deaths.
1st Period	Continued fever - Typhus - -	47·16 } 59·95 } 107·11	{ 0·80 } { 3·99 } 4·79
2nd do.	Continued fever - Typhus - -	78·96 } 14·77 } 93·73	{ 0·00 } { 3·06 } 3·06
3rd do.	Continued fever - Typhus - -	56·47 } 2·64 } 59·11	{ 0·66 } { 2·31 } 2·97

Each of these changes appears to have exercised nearly the same influence upon the cases of diarrhœa and the amount of sickness generally, for the improvement has been nearly the same in each of the periods. The result would probably have been similar in

regard to the mortality had not the second period included the cholera epidemic of 1849, which cut off eleven men of the Guards quartered in the Tower. If these were deducted, the ratio of deaths during the second period would only amount to 16·8 per 1,000. Or, if the months of July, August, and September, during which cholera was rife in that part of London, be entirely omitted from the returns, the relative health of the three periods would be as follows :—

	Ratio per 1,000 of Strength.							
	Admitted into hospital by				Died by			
	Continued fever.	Typhus.	Diarrhea.	All Causes.	Continued fever.	Typhus.	Diarrhea.	All Causes.
1st period	47·2	59·9	105·9	900·5	·8	4·	—	19·6
2d do.	80·3	14·9	76·9	814·7	—	2·9	—	17·8
3d do.	56·5	2·6	82·2	800·5	·7	2·3	—	15·8

APPENDIX LXV.

(Given in by Dr. Balfour.)

EXAMPLE of the INFLUENCE of OVERCROWDING in the PRODUCTION of FEVER among TROOPS.

“ En ce qui regarde la fièvre typhoïde, le fait suivant me semble de nature à répandre un jour considerable sur l'étiologie de cette maladie. Pendant la période de 1843 à 1847 inclusivement, j'ai constaté chaque année, a l'hôpital militaire de Versailles, une épidémie meurtrière de fièvres typhoïdes sévissant vers le mois d'Octobre, exclusivement parmi les malades qui me venaient de la garnison de Saint Cloud. Cette épidémie avait ceci de remarquable qu'elle se manifestait tous les ans, huit jours après l'arrivée de l'ex-roi et qu'elle disparaissait immédiatement après son départ de Saint Cloud, sans atteindre jamais ni la population civile, ni les officiers, ni même les sous-officiers, bien que ces derniers habitassent la même

caserne que les caporaux et soldats. Voici quelques faits capables de donner la clef de l'énigme pathologique.

“ La garnison de Saint Cloud, en temps ordinaire, le composait de quatre à cinq cents hommes et n'avait presque pas de malades ; dès que le roi arrivait, la garnison était portée à douze cents. Les hommes étaient alors entassés dans des chambres étroites et mal aérées, tandis que les sous-officiers, d'ailleurs mieux nourris et moins fatigués de service, avaient toujours au moins une chambre pour deux hommes.”— *Essai sur les Lois Pathologiques de la Mortalité, par M. Boudin. Annales d'Hygiène Publique, vol. 39, p. 379.*

APPENDIX LXVI.

RECRUITING STATISTICS of the BRITISH and FRENCH ARMIES.

(Prepared by the Secretary.)

The following tables are submitted with a view to show the amount of care bestowed in the selection of recruits for the army. As however they are in some respects liable to exception, it appears necessary to premise a few remarks on the nature and extent of the information which they contain.

Recruits are obtained in two different ways in the United Kingdom: 1st, by enlistment at the regiment in which the man wishes to serve; or 2d, by recruiting parties sent to different places for the purpose of raising men. By the first method the recruit having been examined, and found fit by the regimental medical officer, and approved by the commanding officer, is at once taken on the strength of the regiment; but by the second the proceeding is very different. The whole kingdom is divided into a number of districts, in each of which there is an inspecting field officer, an adjutant, a paymaster, and a staff surgeon. Recruiting parties are sent from regiments, by authority from the adjutant general, to these districts, where they are under the command of the inspecting field officer, who stations them in such towns or villages within his district as he thinks proper. When a recruit is enlisted at the head quarters of the district, he is taken, prior to attestation, before the staff surgeon, who decides as to his fitness for the army. If enlisted at any of the out-stations, the recruit is taken to the nearest military medical officer, if there is one within a convenient distance, or, if not, he is examined by a civil medical practitioner. If deemed fit by either of these, he is then attested, and is at a subsequent period taken to head quarters for approval by the staff surgeon. If considered unfit by him, the recruit is discharged with a protecting certificate, but if fit, he is sent to his regiment. Formerly recruits on joining their corps were subjected to another examination by the medical officer of the regiment, and, if objected to by him, were brought before a board who decided the question of his fitness. This, however, was found to be attended with many disadvantages, and the staff surgeon's decision is now final, unless the alleged cause of disqualification has arisen between the period of the staff surgeon's inspection and the recruit joining his corps.

No returns are made of the number of men examined by the medical officers at the head quarters of regiments, nor of those examined by military or civil medical officers at the out-stations of districts. The only available information therefore is to be found in the returns of the staff surgeons. These do not show the total number of recruits inspected for the army, but merely the numbers at the head quarters of the different recruiting districts, and unfortunately they do not distinguish between primary and secondary inspections—men enlisted at head quarters, and those previously inspected at out-stations—although the proportions rejected of the two classes must differ widely. As the relative numbers of head quarters and out-station recruits must vary greatly in the different districts, no correct deductions can be drawn from the apparent difference in the ratio of rejections, nor from the returns of the causes of rejection as illustrating the relative prevalence of different physical disabilities in different districts. The returns, however, show that a considerable amount of care is

taken to prevent the admission of unsound men into the army, and it must be borne in mind that from the circumstances above noticed the proportion of rejections is understated.

During the period over which the following returns extend there were in England five districts, having their head quarters at London, Bristol, Coventry, Liverpool, and Leeds; in Ireland three, Cork, Dublin, and Newry; and Scotland, though considered one, as having only one inspecting field officer, was divided into the Glasgow and Edinburgh districts, each having a staff surgeon. The tables have been divided into two decennial periods, because in 1842 the classification of the causes of rejection was somewhat modified, and it has been thought better not to mix up the results of the two periods.

From these tables it appears that during the first decennium 298 per 1,000 of the recruits examined were rejected, and during the second period 335 per 1,000, or one third of the whole. Although many of these were rejected for causes which affected them only in a military point of view, yet an examination of the returns will show that at least one fourth were for causes which would in all probability have shortened life.

The returns enable us to show the number of primary and secondary inspections separately for six years in the Dublin, and five in the London and Edinburgh districts. Table 8 has, therefore, been prepared with a view to show the great influence which a difference in the relative proportions of these must exercise upon the general results for the district. It also shows that the proportion of these two classes varies considerably in different districts. The following are the results:

	Ratio of rejections per 1,000 examined.		Of 1,000 inspections there were	
	Primary.	Secondary.	Primary.	Secondary.
Dublin - - -	523	211	650	350
Edinburgh - - -	484	130	855	145
London - - -	388	185	816	184

From these results two deductions may be legitimately drawn: 1. That in a district where the number of out-stations, and consequently of secondary inspections, is great, the ratio of rejections may be apparently small, although the number of men unfit for military service, and actually rejected as recruits, may be quite as great as in any of the other districts. 2d. That the proportion of primary and secondary inspections varies so much in different districts as to prevent any fair comparison being drawn until these two classes shall be kept distinct in the returns.

Tables 9 and 10 are annexed, showing the numbers found unfit for military service in France for a period of 13 years. They have been compiled from official documents and show the proportion deemed unfit for

military service on account of physical defects to have averaged 324 per 1,000 of the men examined, or very nearly the same as in the English recruiting districts. In any comparison, however, between them and the English returns, besides making allowance for the defects in the latter above noticed, the difference in the nature of the two services must not be forgotten. The French recruit being compelled to serve if fit, when unwilling to enter the army, has a strong inducement to feign a disability, or to exaggerate one which exists in a slight degree. The English recruit, on the contrary, being usually desirous of entering, conceals any disability, and endeavours to get himself passed by the surgeon by every stratagem which he and the recruiting party, who

have a direct pecuniary interest in his being approved, can devise. In the one service, therefore, the tendency apparently is to increase the proportion of rejections, in the other to diminish it. There is also another important difference: in France the recruit is only examined once, if rejected he does not appear again; in England a recruit who is anxious to be enlisted, if rejected in one district may go to another, and, if deemed unfit there, swell the proportion of rejections by appearing in two different returns. It is true that if detected he is liable to punishment, but it is well known that it is very often done, indeed men frequently pass from one station to another in the same district, but of course that would not affect the returns from the head quarters.

APPENDIX LXVII.

(Furnished by Sir R. Mayne, K.C.B.)

RETURNS relative to the METROPOLITAN POLICE FORCE.

1. RETURN showing the NUMBER of MEN admitted into the METROPOLITAN POLICE FORCE in the Years
2. RETURN showing the NUMBER of CANDIDATES for Employment in the METROPOLITAN POLICE FORCE rejected on Examination by the Surgeon and by the Commissioners in the following Years.

1852	1853	1854	1855	1856
817	1296	1215	1092	993

	1852*	1853	1854	1855	1856
By the Surgeon - -	350	509	371	361	474
By the Commissioners	433	813	1249	1303	1323

* In this year the men who had been temporarily appointed for the Great Exhibition were permanently taken into the force as vacancies occurred, consequently there were less examinations.

3. RETURN of the AVERAGE STRENGTH of the METROPOLITAN POLICE FORCE, the Number of Cases of Sickness and Deaths among the Men, the Number discharged by being invalided, the Number who were dismissed and who resigned, with the Total Number who left the Force from all Causes in each of Five Years, viz., from 1852 to 1856, both inclusive.

Years.	Average Strength of the Force.	Number of Cases of Sickness among the Men.	Number of Deaths.	Number Discharged by being invalided.	Number Dismissed.	Number Resigned.	Total Number who left the Force from all causes, including Death and invaliding.
1852	5,603	11,069	36	194	231	636	1,097
1853	5,632	11,105	41	201	251	896	1,389
1854	5,704	11,293	52	191	189	822	1,254
1855	5,798	10,288	45	190	296	693	1,224
1856	5,834	10,443	43	224	209	703	1,179
Total - -	28,571	54,198	217	1,000	1,176	3,750	6,143
Ratio per 1,000 of strength -	- -	1897*	7*6	35*	41*2	131*2	215*

The specified period of sickness during which a man is allowed to be on the sick list on the authority of the chief surgeon, is not to exceed four weeks in one year, and the amount of stoppage for all ranks during this period is at the rate of 1s. per diem, unless exempted for special reasons by the Commissioner.

The chief surgeon is authorized to certify for longer periods, to be sanctioned by the Secretary of State, and these vary according to the different cases, namely, three, six, or twelve months, and the amount of stoppages during these periods are as follows :—

	s.	d.
Superintendents, daily	-	2 9
Inspectors	-	1 3
Serjeants	-	0 8
Constables (1st Class	-	0 7
Ditto (2nd Class)	-	0 6

unless full pay is allowed on special grounds.

If these men do not recover, and are deemed unfit for further service, upon the certificates of the divisional and chief surgeon they are recommended to the Secretary of State for gratuities, if the service is under 15 years and not less than 5 years, and for pensions if above that period.

4. RETURN showing the AVERAGE NUMBER of Days SICKNESS per Man per Annum, in FIVE YEARS.

Years.	From Injuries.	From other Causes.	Total.	Strength of the Force at end of each Year.				
				Supts.	Inspts.	Serjts.	Consts.	Total.
1852	1*09	11*21	12*30	18	129	602	4,848	5,597
1853	1*22	11*18	12*40	18	127	613	4,866	5,624
1854	1*17	11*48	12*65	18	134	627	4,963	5,742
1855	1*91	11*07	12*98	18	139	640	5,030	5,827
1856	1*79	11*06	12*85	18	143	635	5,093	5,889
Average of the years	1*43	11*20	12*63					

This average is higher than in the years from 1831 to 1845, it being for the whole of that period 9*05, the highest yearly average being in 1831, viz., 11*9, and the lowest in 1843, viz., 7*0.

No cause can be assigned for the increase above stated, nor for the decrease in the years from 1831 to 1845, as appeared by a former return.

The numbers from 1846 to 1851, inclusive, cannot be given, the returns not having been kept.

5. RETURN showing the AVERAGE per 1,000 MEN constantly sick in the whole Force for FIVE YEARS.

Year.	From Injuries.	From other	Total.
1852	2.99	30.71	33.70
1853	3.35	30.63	33.98
1854	3.22	31.46	34.68
1855	5.25	30.35	35.60
1856	4.90	30.31	35.21
For the 5 years }	3.94	30.69	34.63

N.B. The word 'constantly' is taken to mean each day.

6. RETURN showing the AVERAGE NUMBER of DEATHS per 1,000 Men, for FIVE YEARS.

Years.	Average Number.
1852	6.43
1853	7.29
1854	9.05
1855	7.72
1856	7.30
For the 5 years }	7.59

The following TABLE shows the NUMBER of DEATHS from Cholera, Fever, Chest Diseases, all other Diseases, and Accidents.

Year.	Cholera.	Fever.	Consumption and other Chest Diseases	Other Diseases and Accidents.	Total.
1852	1	9	11	15	36
1853	6	9	17	9	41
1854	18	8	18	8	52
1855	0	10	19	16	45
1856	0	5	24	14	43
Total -	25	41	89	62	217

There were no deaths from Diarrhœa or Dysentery during these five years.

7. RETURN showing the AVERAGE AGE of MEN on their Admission into the Police, and AVERAGE LENGTH of SERVICE of those who left from Ill-health during FIVE YEARS.

Years.	Average Age on Admission.	Average length of Service of those worn out, and pensioned.	Average length of Service of those injured on Duty, and pensioned.	Average length of Service of those unfit for further Service, and allowed Gratuities.	Average length of Service of those ordered by the Chief Surgeon to resign without Compensation.
1852	23.5	18.34	6.12	7.44	1.71
1853	23.6	17.19	10.62	7.08	1.55
1854	23.74	17.51	9.12	7.34	1.35
1855	23.71	17.53	8.25	8.10	1.35
1856	24.24	18.85	10.64	8.12	1.11
For the 5 years }	23.76	17.88	8.95	7.61	1.41

The regulated age is under 30. With few exceptions, and those of soldiers only, none above that age are admitted. Few are admitted under 20 years, and those only on the opinion of the Chief Surgeon who examines them, and decides as to their eligibility.

Pensions are granted after a service of 15 years, and in some cases, on account of injuries received on duty, for a service of less than 15 years; and gratuities are allowed when the parties become unfit for duty (not the result of injuries) after a service of five years, and less than fifteen.

8. HOURS of NIGHT DUTY.

The hours of night duty are eight out of 24, and each man is on night duty, upon an average, eight months in the year.

9. PAY.

The pay of a serjeant is 3s. 6d. daily, or 24s. 6d. weekly.

There are two rates of pay for constables, the first 3s. per day or 21s. per week, received at present by about 1,460 men; and the second 19s. per week, or a fraction less than 2s. 9d. per day, received by about 3,945 men.

10. RATION.

None. But arrangements are made for the single men who reside in Section Houses to mess together.

11. COALS.

40 lbs. weekly are allowed to each married man all the year, and 40 lbs. weekly to each single man during six months, and 20 lbs. weekly during the remainder of the year.

12. CLOTHING.

One body coat, two pairs of trowsers, and two pairs of boots yearly.

One great coat and cape once in two years.

13. SPACE ALLOWED IN SLEEPING ROOMS.

The single men reside and sleep in what are called Section Houses, a space of from 450 to 500 cubic feet, or 50 superficial feet, being allowed to each man, for which a deduction of 1s. weekly is made from his pay.

The average number of single men residing in Section Houses during the last five years has been 1,700.

Metropolitan Police Office,
July 6, 1857.

APPENDIX LXVIII.

(Given in by Mr. Childs.)

RETURNS relative to the CITY POLICE FORCE for the Year 1856.

I.—Recruitment of the Force.

Average strength for the year 1856	-	567
Number of candidates for admission	-	260
" admitted	-	104
" rejected by the Commissioner (moral causes)	-	90

Number rejected by the surgeon (physical causes)	-	-	-	40
" of men dismissed	-	-	-	21
" resigned at their own desire	-	-	-	36
" resigned on account of bad health	-	-	-	12

Number resigned on reports against them	-	-	-	13
„ resigned or rejected on probation	-	-	-	12
„ retired on pensions or gratuities	-	-	-	7
„ dead	-	-	-	3
Minimum age on admission	-	-	-	21 years
Maximum	-	-	-	32 „
Average age of men admitted in 1856	-	-	-	25.72
Minimum height of the candidate	-	-	-	5 ft. 8 in.
Average height of men now forming the force	-	-	-	5 ft. 9 $\frac{3}{4}$ in.
Number of married men	-	-	-	415
„ of single men	-	-	-	128
N.B.—The men remain in the force on an average, about	-	-	-	4 years.

A twelvemonth's good character from the last situation is required of all candidates, and a testimonial in favour from two respectable householders, not being publicans.

Not admitted with a family of more than two children.

The single men in the force may marry when they think fit.

II.—Clothing, Pay, Rations, Barracks.

1. Clothing.

Two suits of clothes always in use, viz. :—

One coat.

Two pairs of trousers of the current year.

And the like suit of the past year.

One great coat.

One cape and belt. (Truncheon and lantern.)

Three shillings per month are allowed the men in lieu of boots, of which each is required to possess two pairs in good condition.

One police hat.

A suit of plain clothes (civilian or non-official dress) must be provided by each man at his own expense.

The cost to the authorities for clothing £ s. d.
per man per annum is - - - 4 5 6

2. Pay.

1st class - - - 23s. per week.

2nd class - - - 22s. „

3rd class - - - 20s. „

On admission to the corps, each man undergoes a month's probationary duty; his pay during this period is 17s. per week, and continues at this until certified.

3. Rations.

The men provide their own rations.

4. Barracks.

The force is divided into two divisions, viz. :—

Men living in barracks - - - 124

Men living at home - - - 450

The houses occupied as barracks are but ill adapted generally for such a purpose; they have been reported on unfavourably by the surgeon.

The ratio of sick is higher amongst those who live in barracks than amongst those residing at home, in the proportion of 1,450 to 1,440.

III.—Duty.

The force is divided into a day police and a night police.

Day police is subdivided into two relays.

Day Police. 1st relay commence duty at	-	6 A.M.
and are relieved at	-	10 A.M.
2nd relay commence at	-	10 A.M.
and are relieved at	-	2 P.M.
1st relay resume at	-	2 P.M.
and are relieved at	-	6 P.M.
2nd relay resume at	-	6 P.M.
and are relieved at	-	10 P.M.

Night Police. This division of the force goes on duty at - - - 10 P.M.
and is relieved at - - - 6 A.M.

N.B.—All night men in barracks are supposed to be in bed at 8 A.M., and must leave it by 3 P.M. The day men are in bed by 12 P.M. At that time the lights are extinguished and absentees noted.

Absentees are fined 6d. for the first offence and 1s afterwards.

IV.—Sick Movement.

1. Number of deaths for the year 1856	-	3
Ratio per thousand	-	5.28
2. Average of the force constantly on the sick list	-	21.14
Ratio per thousand, constantly sick	-	38.8
3. Number of days sickness per man	-	days 13.5
4. Admissions to the sick list for the year	-	818
5. Ratio of admissions per thousand	-	1442.6
5. Average duration of each attack of sickness of actual admissions	-	16.6

N.B.—The amount of stoppages from the pay of the men whilst on the sick list is 1s. per day.

TABLE A.

Strength of the Force for the Year 1856 from 1st January to 31st December.

	Constables.	Sub-Inspectors.	Inspectors.	Total.
January -	500	51	13	564
February -	500	51	13	564

G. BORLASE CHILDS, F.R.C.S.
Surgeon to the Force.

APPENDIX LXX.

PAPERS given in by W. FARR, M.D., F.R.S.

TABLE I.—(1.) Ages of the effective Men in the Army on March 31st, 1851 (including the Non-commissioned Officers, Privates, Cavalry, Infantry, Artillery, and Engineers).

(2.)—The annual Deaths that would happen among the effective Men in the Army, at Home and Abroad at Three Rates of Mortality prevailing among the Civil Population.

Ages.	Total Men.*	Annual Deaths at the rates prevailing.		
		In healthy Places.	In all England.	In the unhealthiest City.
All ages -	136,277	1,051	1,248	1,688
10—15 -	310	1	1	2
15—20 -	11,601	66	77	104
20—25 -	50,387	367	424	512
25—30 -	38,242	303	352	463
30—35 -	22,099	186	226	330
35—40 -	10,005	90	116	187
40—45 -	3,101	31	42	72
45—50 -	407	5	7	12
50 and upwards	125	2	3	5

* From Census Report; occupations, vol. 1, p. ccxli. The above numbers include the strength of the army at home and abroad.

The annual rate of mortality among the effective men of the army would be:—

7·7, or less than eight in 1,000, at the rate prevailing among the healthy country population of England and Wales.

9·2, or rather more than nine in 1,000, at the rate prevailing among the whole population of England and Wales.

12·4, or rather more than twelve in 1,000, at the rate prevailing in one of the unhealthiest cities (Manchester).

TABLE II.—MORTALITY of the Civil Population of England and Wales at different Ages.

Age.	Annual rates of mortality.		
	Males.		
	Healthy Districts.	England and Wales.	Manchester.
x	m ^x	m ^x	m ^x
12—13 -	·00,383	·00,476	·00,572
17—18 -	·00,567	·00,664	·00,897
22—23 -	·00,728	·00,842	·01,016
27—28 -	·00,792	·00,921	·01,212
32—33 -	·00,843	·01,023	·01,492
37—38 -	·00,898	·01,162	·01,870
42—43 -	·00,985	·01,354	·02,331
47—48 -	·01,152	·01,615	·02,887
57—58 -	·01,885	·02,563	·04,748

These rates were deduced from the two life tables (see Registrar General's 7th Annual Report, p. 336, and 12th Report, Appendix, p. 75), and the table for the healthy districts, not yet published.

The mortality at the above ages has been taken to represent the mortality of the troops at the ages corresponding; and thus the number of troops living at the age 20 and under 25 multiplied by the rates of mortality at the age 22-23 = the deaths that would have happened out of the troops of that age. The number of men in the return, of the age of 50 and upwards, is inconsiderable; their mortality is represented by that at the age 57-8.

TABLE III.

ANNUAL DEATHS per 1,000 in the Army if the Mortality were at the *same Rate* as it is among various classes of the labouring Population in England and Wales—at the *same Ages*.

Deaths per 1,000 in the Army, if the mortality were at the same rate as it is among	
Blacksmiths	7·7
Bakers and confectioners	8·7
Wool, cotton, and silk manufacturers	8·7
Miners, &c.	8·9
Carpenters and joiners	8·9
Grocers	9·0
Labourers, &c.	9·5
Shoemakers	9·5
Butchers	10·3
Tailors	11·5
Inn and hotel keepers, licensed victuallers, &c.	11·7

Note.—The mortality is somewhat overstated by the above numbers.

The mortality in the several trades was not determined at the ages under 20, and at the other ages 20-25, 25-35, 35-45, were the fixed periods of age in the published Tables; the above table has consequently been deduced from the following number of soldiers:—

Age.	Effective Soldiers.
20-25	50,387
25-35	60,341
35-45	13,106
	<hr/> 123,834
Soldiers of the age 10-20	- - - 11,911
Soldiers of 45 and upwards	- - - 532
are not brought into the above account.	<hr/> 136,277

TABLE IV.

MORTALITY by CONSUMPTION among the MALE POPULATION of England, at Four Ages.

Age.	Living.	Dying by Consumption.	Annual Mortality per 1000 by Consumption.
20-25	489,611	1,732	3·5
25-30	467,958	1,861	4·0
30-35	444,906	1,822	4·1
35-40	420,282	1,710	4·1
20-40	1,822,757	7,125	3·9

The above results were deduced from the population of England and Wales enumerated in 1851, and the deaths by consumption at the ages 20-25, 25-30, 30-35, 35-40 in the five years 1849-53.

APPENDIX LXXI.

(Given in by Mr. Neison.)

THE average mortality for England and Wales (males) will be found in "Contributions to Vital Statistics," pp. 4-8.

At ages 20 to 30 the rate of } = 0·974 per cent. per an.
mortality }

" " 30 " 40 " = 1·110 " "

" " 40 " 50 " = 1·452 " "

These results of course include all classes,—the invalided, the destitute, and the dissolute.

If, however, the observations were limited to members of Provident and Benefit Societies only, from which are necessarily excluded the destitute and the dissolute portion of the population, then the following are the corresponding results, and are also taken from "Contributions to Vital Statistics," pp. 20-7.

ABSTRACT A.

Ages.	Mortality per Cent. in the following Districts.			
	Rural.	Town.	City.	3 Districts.
20 to 30	0·722	0·611	0·787	0·707
30 to 40	0·792	0·854	1·162	0·838
40 to 50	0·934	1·203	1·685	1·143

These may be considered as offering a fair type of the mortality of the really industrious classes in the respective districts. It may, however, be shown that the preceding rates of mortality, although contrasting favourably with the results, for the general population of the whole kingdom, are still greatly augmented beyond the most healthy type by the presence of some unhealthy occupations. For example, if the mortality of labourers in the rural districts be com-

pared with the mortality of the residue of the same districts the results will be,—

ABSTRACT B.

Ages.	Mortality per Cent. amongst		Excess per Cent. of (b) over (a).
	(a). Labourers in the Rural Districts.	(b). Residue of Rural Districts.	
20 to 30	0·600	0·824	37·333
30 to 40	0·604	0·802	32·781
40 to 50	0·826	1·042	26·150

The full effect of these differences in the various rates of mortality will perhaps be best seen by having regard to the "equation" of life, as pointed out in pages 100-1 in "Contributions to Vital Statistics."

Let this be compared for age 20.

Equation of life, age 20, England and } = 44·212
Wales, whole population

" " Friendly Societies = 47·434

" " Rural districts = 49·353

" " Labourers in do. = 52·240

It hence follows that by the preceding test the duration of life of labourers in the rural districts exceeds that of males generally in England and Wales by no less than eight years, or about 18 per cent.

On recurring, however, to the rate of mortality which actually prevails within the period of life 20-50, as shown in preceding illustrations, the deaths in the general population will be found to exceed those amongst the rural labourers, who are members of Friendly Societies, by 74 per cent., in other words,

amongst a population of rural labourers producing 100 deaths per annum no less than 174 deaths would take place at corresponding ages in the general population of this country.

The following are the results for the three decennial periods of life under review :

ABSTRACT C.

Ages.	Mortality per Cent. in		
	England and Wales, (a).	Labourers, Members of Friendly Societies, Rural Districts. (b).	Excess per Cent. of (a) over (b).
20 to 30	0·974	0·600	+ 62 per cent.
30 to 40	1·110	0·604	+ 84 "
40 to 50	1·452	0·826	+ 75 "

The difference here shown is remarkable, and important to be understood. The results in column (b) may be held as indicating a more healthy type than that of any section of the population with which scientific inquiries have yet made us acquainted.

A careful perusal of the work from which these figures are taken will show that the favourable rate of mortality amongst labourers is to a great extent accounted for by the nature of the bodily or physical exercises to which their daily avocations subject them. A striking instance of this will be found by comparing the results in the following abstract taken from page 456 of "Contributions to Vital Statistics."

ABSTRACT D.

Ages.	Expectation of Life amongst Out door Occupations requiring		
	Little Exercise (a).	Great Exercise (b).	Excess of (b) over (a).
20	37·8 years	43·4 years	15 per Cent.
30	30·1 "	36·6 "	21 "
40	23·0 "	29·1 "	27 "

Whenever the value of life in two classes of occupations, in which the habits and general circumstances of the persons following them differ little, except that the one is called upon for a large amount of physical exercise, and the other a comparatively small amount, it will then be almost invariably found that those habituated to a great degree of exercise are subject to a lower rate of mortality. If even the results for in-door occupations in which the differences in the degrees of exercise are much less than amongst those following out-door occupations, be compared, there will after age 40 be found a marked distinction in the group of greatest exercise, although the difference under that age is little. It is, however, the case of the out-door occupations which applies more strictly to that of the soldier, and with which he may with more propriety be compared than with an in-door and sedentary occupation.

There is a further remarkable example of the low rate of mortality in the case of railway employes, when deaths from violent causes have been eliminated.

The same distinction will be found to prevail in the rates of mortality between females engaged in "active" and "sedentary" occupations. The following figures are taken from page 462 of the work already referred to :—

ABSTRACT E.

Ages.	Mortality per Cent. amongst Females following		
	Sedentary Occupations, (a).	Active Occupations. (b).	Excess per Cent. of (a) over (b).
21 to 30	1·035	0·882	17·347
31 to 40	1·227	0·395	212·245
41 to 50	1·492	1·319	13·116
Total - -	1·159	0·834	38·980

The active occupations include charwomen and washerwomen, cooks, domestic servants, housewives, laundresses, &c., &c.

The sedentary occupations include dressmakers, lacemakers, milliners, sempstresses, shoebinders, straw-bonnet makers, &c., &c.

The preceding statements will be found to throw some light on what follows, in regard to the mortality among the troops in the united kingdom.

The last statistical report on the health of the troops, dated 31st March 1853, affords the means of comparing the actual mortality which has taken place at each term of life with that which would have prevailed had the ratio of deaths corresponded with either of the preceding standards. Among the Household Cavalry there has been the lowest rate of mortality. The following abstract shows its relation to that of the country generally, to that of the out-door occupations with great exercise, and to that of labourers in the rural districts :—

ABSTRACT F

Ages.	Household Cavalry.	Number of Deaths in					
		England and Wales.		Out-door Occupations.		Labourers in the Rural Districts.	
		No. of Deaths.	Difference.	No. of Deaths.	Difference.	No. of Deaths.	per Cent.
Under 20 - -	7	6·97	0·430	6·45	8·527	5·42	2·10
20-25 - -	45	33·76	33·294	29·10	54·639	24·55	8·00
25-30 - -	26	25·16	3·338	22·51	15·504	14·19	8·20
30-35 - -	24	19·22	24·870	11·23	113·713	10·41	13·40
35-40 - -	13	17·97	-27·657	14·32	-9·028	9·74	3·70
40 & upwards	19	18·64	1·931	11·54	6·465	11·01	7·70
Total - -	134	121·72	10·089	95·15	40·830	75·32	7·00

The actual number of deaths among the Household Troops during the years 1837-46 will be thus seen to exceed the ratio, according to the average mortality of England and Wales, by about 10 per cent.

It likewise appears that except at the term of life 35-40 there has been an excessive mortality at all ages.

Again, applying the test of out-door occupations, the actual excess of mortality is upwards of 40 per cent. on the gross results, showing an excess of no less than 113·7 per cent. for the term of life 30-35.

In like manner, applying the test of labourers in the rural districts, the actual mortality exceeds it by 77·9 per cent., and in this instance it will be seen that at every term of life there is an excess of mortality, varying from 29 per cent. under 20 years of age, to 130 per cent. in the quinquennium 30-35.

The following are corresponding comparisons instituted in respect to the Dragoon Guards and Dragoons.

ABSTRACT G.

Ages.	Dragoon Guards and Dragoons.	Number of Deaths in					
		England and Wales.		Out-door Occupations.		Labourers in the Rural Districts.	
		No. of Deaths.	Difference.	No. of Deaths.	Difference.	No. of Deaths.	per Cent.
Under 20 - -	46	41·46	10·950	38·42	19·721	32·27	4·40

Total - -	705	512·32	37·609	408·23	72·697	321·46	11·10

In this example it will be found that at every term of life the actual mortality has been greatly in excess of that of each of the classes with which it is compared, and the aggregate difference for this class is,— 37·609 per cent. in excess of England and Wales.

72·697 " " out-door occupations. and 119·312 " " labourers in rural district.

The smallest difference is in every instance at the period of life under 20 years of age, and the greatest within the decennium 25-35.

The next step is to see the relation which the actual number of deaths in the Foot Guards in the years

1837-46 bears to that which would have resulted from the ratios of each of three tests now applied :—

ABSTRACT H.

		Number of Deaths in					
Ages.	Foot Guards.	England and Wales.		Out-door Occupations.		Labourers in the Rural Districts.	
		No. of Deaths.	Difference.	No. of Deaths.	Difference.	No. of Deaths.	Difference.

-	820	393'18	108'556	314'10	161'063	246'01	233'320

This abstract shows the remarkably high mortality which prevails at all ages in the Foot Guards, the general results being 108'556 per cent. in excess of the average for England and Wales ; 161'063 per cent. in excess of out-door occupations, and 233'320 per cent in excess of labourers in the rural districts.

It now remains to determine the results for the Infantry of the Line, which constitutes sixty per cent. of the whole body of observations in reference to the troops of the united kingdom given in the War Office Report of 1853, and for this purpose the following abstract has been prepared, and which, in common with the three preceding ones, shows for each term of life the actual number of deaths according to each of the tests applied, and the difference per cent. in each class of results :—

ABSTRACT I.

		Number of the Deaths in					
Ages.	Infantry of the Line.	England and Wales.		Out-door Occupations.		Labourers in the Rural Districts.	
		No. of Deaths.	Difference.	No. of Deaths.	Difference.	No. of Deaths.	Difference.

60 and upwards.	67	37'74	77'530	23'37	186'692	22'29	200'583
Total	2823	1472'21	91'752	208'37	133'620	958'06	194'658

This affords a succinct view of the relation in which the different results stand to each other.

In the War Office Report itself a comparison is instituted between the actual mortality of the army and that which prevails in twenty-four large towns in England and Wales ; but such a comparison is obviously at fault, for as I have elsewhere fully shown, and as already pointed out by preceding illustrations, the gross mortality, not only of the whole kingdom, but of individual towns and districts, is greatly increased by the inclusion of the destitute, the dissolute, and the intemperate, as well as by the presence of many persons following occupations and trades of an unusually unhealthy character. Even in the rural districts of this country it will be seen, on referring to pp. 53-59 of "Contributions to Vital Statistics," that the mortality of the sixteen trades referred to in page 58 of that work is greatly in excess of the residue of the same districts.

The military are certainly free from the noxious influences peculiar to many trades and occupations ; they do not suffer from destitution, nor can they be classed as a body with the notoriously intemperate. Every just comparison must therefore be made with some such classes as those forming the two last sections of the preceding abstracts, but even if the comparison be made with the general mortality of England and Wales (for the male sex), it will be found that the Infantry of the Line are subject to an increased ratio of mortality of no less than 91'752 per cent.

If the out-door occupations } however be made the stand- }
 however be made the stand- }
 excess amounting to - } = 133'620 per cent.

And in respect to labourers }
 in the rural districts, the } = 194'658 per cent. ;
 excess is no less than - }
 being nearly three times the rate of mortality in this branch of the service that is found to take place amongst labourers in the rural districts at the corresponding ages.

If attention be now directed to the data furnished in regard to the Metropolitan Police Force in pp. 459-61 of "Contributions to Vital Statistics," it will be found, that although that body is compelled to discharge very irksome, laborious, and harrassing duties, still the rate of mortality to which the members have been subject is somewhat less than that for England and Wales generally. During a period of eight years (1831-8) over which the data in question extends, the actual number of deaths per annum was 32, out of an average force of 3,313 ; but if they had experienced the rate of mortality of the five following classes, the yearly number of deaths would have been,—

According to England and Wales - - - 33
 " experience of Household Cavalry - 38
 " " Dragoons, &c. - 45
 " " Infantry, &c. - 64
 " " Foot Guards - 70

It is difficult to understand why the troops in the United Kingdom should experience a rate of mortality differing so widely from that of the Police Force which is much exposed, and in which each constable is during two months out of every three compelled to be on night duty for nine hours each night.

From a more recent return for the Metropolitan Police Force than that just referred to, it appears that during the five years 1852-56, the highest rate of mortality has been 0.905 per cent. and the lowest do. " " 0.643 " the average being " " 0.755 "

These observations extend over an average force or strength of 5,735 men, a number sufficiently great to make the results reliable for a comparison like the present one ; and if these more recent results be made the standard of comparison with the army, the contrast will be evidently still more striking than even the preceding one.

There is still another illustration of the remarkable disparity between the mortality of the army and a class of persons much exposed to active physical out-door duties, namely, railway servants. In page 448 of "Contributions to Vital Statistics" will be found some data on the vital statistics of railway employés, and from those I have deduced what would have been the number of deaths in each of the four classes of troops, if the mortality had been in the same ratio as that of railway employés :—

	Actual Deaths.	Number according to Railway Employés.
Household Cavalry - -	134	99
Dragoon Guards and Dragoons	704	417
Infantry of the Line - -	2,823	1,205
Foot Guards - -	820	320

The data furnished in the War Office Report, dated the 31st March 1853, affords the means of solving the question, whether intemperance prevails to any serious extent in the army, or to such a degree as to materially affect the health and duration of life of the soldier.

The results of an inquiry made into the rate mortality amongst persons of intemperate habits (see "Contributions to Vital Statistics," p. 222), show that at corresponding ages there is relatively to the deaths from all causes an excessive development of diseases of the "nervous system," and of the "digestive organs."

In England and Wales these two groups of diseases at ages 20 and upwards constitute 15'950 per cent. of the deaths from all causes at corresponding ages, but amongst intemperate persons they form 50'400 per

cent. of all the deaths which take place, or more than three times the general average. These diseases may, therefore, be regarded as the distinctive type of the causes of death among intemperate persons, and the predominance of deaths assigned to such causes in any particular collection of facts may fairly lead to the inference of irregularity of habits having prevailed to an unusual extent. A remarkable illustration of this will be found in the following results :—

ABSTRACT K.

Group of Facts.	Ratio per Cent. of Deaths from the following Causes, to the total Deaths.	
	Nervous System and Digestive Organs.	Respiratory Organs.
England and Wales, 1847 -	15' 950	33' 150
Gotha Life Office, 1839-49 -	23' 553	27' 843
Standard Life Office, 1846-50 -	30' 034	22' 867
Scottish Widows' Fund, 1815-52 -	34' 084	21' 096
Intemperate Lives - - -	50' 400	22' 980

An inspection of these results immediately throws suspicion on the habits of the lives assured in the "Standard Life Office" and the "Scottish Widows' Fund," but particularly the latter, the observations on which extend over a period of thirty-eight years, and those who are familiar with the usages of Scotch society during the greater part of this period may perhaps be not altogether unprepared for such a result.

It will be seen that the ratios for the "Scottish Widows' Fund," whose business until very recently was to a great extent limited to the North, hold something like an intermediate place between those for "England and Wales generally," and the "Intemperate Group."

The results for diseases of the "respiratory organs," it will also be observed, are for the whole kingdom at a maximum, and as a necessary consequence in the intemperate group at a minimum. It may hence be stated that an excessive development of diseases of the "nervous system" and "digestive organs" relatively to the deaths from all causes, indicates the prevalence of intemperate habits amongst the class of persons over whom the observations have extended.

With these remarks I shall now proceed to examine into the corresponding results for the troops of the United Kingdom. It should, however, be kept in view that the preceding figures are deduced from the deaths happening at all ages of 20 and upwards, whereas an examination of the first abstract in page 31 of the War Office Report already referred to, will show that a very small portion of the army is above the age of 40. To clear the comparison about to be instituted of any anomalies arising from differences in the distribution of observations over varying periods of life, independent results have been deduced for the precise ages in which the deaths have taken place in the army itself, and it is proposed to show the relation of these results to the corresponding ones at the same ages for the whole kingdom, the metropolis, the 24 large towns referred to in page 7 of the War Office Report of 1853, the county of Kent, and the intemperate group of lives before mentioned.

The results are as follows :—

ABSTRACT L.

Group of Facts.	Ratio per Cent. of Deaths from the following Causes to the Deaths from all Causes.	
	Nervous System and Digestive Organs.	Respiratory Organs.
England and Wales - - -	13' 156	44' 480
Metropolis - - -	11' 631	55' 975
24 Towns - - -	10' 375	52' 079
County of Kent - - -	13' 217	49' 751
Household cavalry - - -	11' 194	58' 955
Dragoon guards, &c. - - -	11' 051	53' 908
Infantry of the line - - -	10' 960	57' 277
Foot guards - - -	6' 927	67' 683
Intemperate lives - - -	50' 376	27' 068

Applying this test it is evident that the army may be considered quite as free from the baneful influence of intemperance as the other combinations brought into comparison, and very much more so, than the general population of the kingdom at the same ages. In fact the inferior health of the troops is not to be accounted for by the increased intensity of these diseases, and it will be observed that in the most healthy branch of the service,—the Household Cavalry,—the relative amount of deaths from causes connected with the "nervous system" and "digestive organs" is much greater than in the Foot Guards, in which the value of life is much less, and it may be further remarked that the relative freedom from these diseases in the army follows the order of decreasing health. I consider, therefore, that it may be safely affirmed that there has during the ten years 1837-46, to which the War Office Report relates, existed no serious amount of intemperance sufficient to account for any material augmentation in the general mortality.

Not only is this not the case, but the absolute rate of mortality in the Household Cavalry, Dragoon Guards, &c., and Foot Guards collectively, from these causes is very little increased beyond the normal rate compared with the remarkable increase in the general mortality of these troops when taken in the aggregate, and it will be hereafter seen in Abstract M. that in the Foot Guards, the most unhealthy of all the troops, the number of deaths which has taken place from diseases of the "nervous system" and "digestive organs" is almost identical with that which would have happened according to the intensity with which these diseases are known to affect the general population of England and Wales, as well as that of the 24 large towns, namely 51 deaths in each instance.

In the Infantry of the Line, however, although the absolute increase from these diseases is very considerable, it is still much less than the increase in the diseases of the "respiratory organs," and therefore to some degree follows in this respect the law which appears to regulate the results of the other branches of the service, namely, that the remarkable increase in the mortality of the army is not to be accounted for by any undue intensity in those diseases, which may be considered a type of intemperance and irregular habits.

A careful examination of the annexed tables, I., II., and III. will show that the great increase in deaths in the various branches of the army is due to diseases of the "respiratory organs." The "War Office" returns do not furnish data of the number of deaths which has taken place from specific diseases at various terms of life. An accurate comparison of the relation of the mortality from a given disease may, however, even in the absence of this element, be made with other results.

For example, in page 31 of the War Office Report will be found the numbers of the army exposed to the risk of mortality at various ages, and as the rate of mortality for specific diseases, at the various

terms of life is known, for various groups of observations, the number of deaths which would have happened in the army, according to the ratios of any particular class of data and disease may be easily determined, and when compared with the actual number of deaths experienced in the army will afford the means of drawing some valuable conclusions.

The following is a condensed abstract of the annexed Table II., and gives the general results for three classes of disease which form the cause of 70 per cent. of all deaths in the army.

The first comparison will be with the ratios of deaths, according to the experience of the general population of England and Wales.

ABSTRACT M.

	Number of Deaths from Diseases of the					
	Respiratory Organs.			Nervous System and Digestive Organs.		
	England and Wales.	Actual.	Diff. per Cent.	England and Wales.	Actual.	Diff. per cent.
Household cavalry	62·870	79	+ 25·656	16·794	15	-10·686
Dragoon guards, &c.	251·112	400	+ 59·291	59·901	82	+36·893
Infantry	760·005	1641	+115·902	176·918	314	+77·483
Foot guards	203·560	555	+172·647	50·784	51	+ 0·425
Total	1277·547	2675	+109·387	304·397	462	+51·775

From this abstract it is evident that there is a remarkable increase of mortality from diseases of the “respiratory organs.”

The mortality from diseases of the “nervous system” and “digestive organs” is also very much augmented absolutely in respect to the general mortality of the country from those diseases, but this augmentation is not to one-half the extent of that which has taken place in connexion with the “organs of respiration.”

It has also been pointed out that the deaths from disease of these organs form about 60 per cent. of the deaths from all causes, while deaths arising from disease of the “nervous” and “digestive organs” constitute not quite 11 per cent. of all the deaths of the troops.

It therefore follows that if even the ratio of increase in the mortality were the same in both groups of disease now under consideration, that still the absolute increase in the number of deaths in the former group would greatly exceed that of the latter, seeing also that the ratio of increase in the “nervous” and “digestive organs” is not quite one-half of that in the “respiratory organs,” there will be found an absolute increase numerically in the mortality of these organs of upwards of eight times that which has happened in the “nervous” and “digestive organs.” It is hence of primary importance to inquire into the changes and fluctuations which may be taking place in the condition of that class of disease to which six-tenths of all the deaths are due.

On referring to Abstract M. preceding, it will be found that the total excess of deaths above the average for England and Wales is 1982·57, while at the same ages, in diseases of the “respiratory organs” only, it will be seen there is an excess of no less than 1,397·45 deaths, or about 70 per cent. of the whole increase.

This result deserves the most careful and patient consideration. Again on referring to the Abstract L. preceding, it will be seen that according to the mortality of England and Wales, the normal ratio of deaths from diseases of the “respiratory organs” is 44·48 per cent., and yet of the whole excess of deaths from all causes, no less than 70 per cent. is due to the “organs of respiration.”

The full importance of this result will be perhaps better appreciated by the following illustration:—

Actual number of deaths }
from diseases of the } = 2,675·0
“respiratory organs” }

Normal number of deaths = 1,277·6

Difference or excess = 1,397·4 = 109 per cent.

If the residue of the deaths from all other causes whatever be viewed in this manner, the results are,—

Actual number of deaths }
from all other causes } = 1,807·0

Normal number of deaths = 1,221·8

Difference or excess = 585·2 = 49 per cent.

These results conclusively show that the condition of the army is such as to induce an excess of diseases of the “organs of respiration” with a much higher intensity than all other diseases collectively; in fact, the excess of deaths from diseases of the “organs of respiration,” is considerably more than double that from all other causes.

The Abstract M. preceding, offers an interesting illustration on this subject. The various classes of troops are therein arranged according to their order of health; and an examination of the differences in the fourth column shows, that as the health of the troops deteriorates, the excess of deaths from diseases of the “respiratory organs” increases; the excess in the Household Cavalry, the most healthy branch of the service, being 25·656 per cent., while the excess in the Foot Guards, the least healthy, is no less than 172·647 per cent.

It is therefore to the physical conditions which affect these organs that we must look for a solution of the problem as to the health of the army.

Having regard to these circumstances, and keeping in view the remarkable influence on health shown to connect itself with the regular, active, physical exercise demanded of those following the more laborious industrial occupations, and also the fact of the remarkably high ratio of diseases of the “respiratory organs” found to prevail in the army, the question immediately arises whether the discipline and condition of the troops is such as to occasion that kind of physical exercise which is best calculated to produce a healthy state of the lungs. To the diseases of these organs is due the greatly increased mortality, and it is for those who are familiar with the precise details and character of the physical exercises which are undergone especially by the Infantry of the Line and the Foot Guards, to inquire whether they are not of a nature to be seriously injurious rather than beneficial to the soldier’s health.

The fourth column of Abstract M. preceding, shows a frightful increase of deaths from diseases of the “respiratory organs” in these two sections of the troops. In the Household Cavalry, Dragoon Guards, &c., the ratio of deaths from the same causes is however less in a remarkable degree, but in conjunction with this important fact, that in all the cavalry regiments, the stable duties, field and parade discipline, sword exercise, &c., produce an amount of that sort of exercise which calls into action the organism of the thoracic viscera in a manner unknown to the foot soldier; who, on the other hand, when on drill and duty is too often so loaded with knapsack and other accoutrements, as to seriously constrain and hinder the free action of the organs of the chest, and consequently the greater the amount and intensity of the other and locomotive exercises to which he is subjected, the more severely do they operate against the normal condition of the organs of respiration, and hence although the foot soldier does undergo a considerable amount of one sort of exercise, it has hitherto been of a nature markedly destructive of the “respiratory organs.”

The following abstract is deduced from pp. 58-63 of the War Office Report of 1853, showing that *phthisis pulmonalis* is the great scourge of the army.

ABSTRACT N.

RATIO of DEATHS from the following Causes, to total deaths from *Diseases of the Lungs*.

Disease.	Dragoon Guards, &c.	Infantry of the Line.	Foot Guards.
Pneumonia - - -	6'000	9'445	7'568
Pleuritis - - -	0'500	0'609	0'360
Hæmophysis - - -	4'500	2'194	3'063
Phthisis Pulmonalis - -	76'750	75'625	86'306
Catarrhus Acutus - - -	3'000	3'352	1'261
„ Chronicus - - -	7'250	8'227	1'261
Dyspnœa Continua - - -	0'750	0'426	—
Angina Pectoris - - -	—	—	0'181
Asthma period. convul. -	1'250	0'122	—
Rate of deaths from phthisis pulmonalis, to death from all causes - - -	45'347	46'254	60'176

In the preceding abstract, it is evident that *phthisis pulmonalis* follows the same law, in respect to the whole group of diseases of the “respiratory organs,” which the whole group itself has in Abstract M. been shown to follow in regard to the total deaths from all causes, being at its maximum in the least healthy troops. The results for the Household Cavalry are not given in the same complete form, and are therefore not included in this abstract.

The deaths arising from diseases of the “respiratory organs,” and also from diseases of the “nervous system” and “organs of digestion,” have been shown to constitute as much as 70 per cent. of the deaths from all causes in the army.

The deaths arising from each of the remaining diseases are in numerical value so inferior as not to

admit of similar treatment for each, but it may be important to view their results in the aggregate. If, therefore, these three groups of diseases be excluded, namely, diseases of the “respiratory organs,” of the “nervous system,” and “digestive organs,” the residue show the following results:—

Actual number of deaths } = 1345
from all other causes }
Normal number of deaths = 917'5

Difference or excess = 427'5 = 47 per cent.

This, with the preceding results, will enable any one to form a pretty correct opinion on the causes immediately operative in producing the excess of mortality in the army.

It can be shown from abundant evidence that, whatever may be the cause producing generally an excessive mortality in any particular body of men or community, it will not only show itself in the development of an inordinate number of deaths through the organism of the human frame, on the vitality of which it peculiarly presses, but its deteriorating influence will likewise be felt on other parts of the system, although not in so eminent a degree as on its own peculiar organism. A marked illustration of this will be found in the “Contributions” already referred to, on the mortality of persons of intemperate habits, as well as in the War Office Report of 1853, the contents of which are now under consideration; and hence, although all the other diseases in the aggregate show an increase of mortality beyond the normal conditions, much inferior in intensity to that affecting the “respiratory organs,” such results are only the natural sequences which are in accordance with all corresponding observations, and confirm the reality of the existence of those conditions which press with extreme severity on the organism, which becomes the special cause of decay and mortality.

If any other test than the general mortality of the kingdom be applied to the state of health of the army, corresponding results to those preceding will be arrived at.

In table III. this will be found done for the metropolis, the 24 town districts, the county of Kent, and in further illustration of what has been said on the subject of intemperance, also on the intemperate group of lives.

F. G. P. NEISON,
2, Waterloo Place,
Pall Mall.

APPENDIX LXXII.

DESCRIPTION of DIAGRAMS illustrative of the NUMERICAL RESULTS in the REPORT showing the MORTALITY in the BRITISH ARMY.

(The Tables and Diagrams were furnished by Dr. Farr, F.R.S.)

Diagrams are of great utility for illustrating certain questions of vital statistics by conveying ideas on the subject through the eye, which cannot be so readily grasped when contained in figures. This aid has therefore been called in to give greater clearness to the numerical results in the body of the report and in the Appendix.

Diagrams have been prepared illustrative of the comparative health of men of the army ages in England, and of soldiers in barracks on home stations.

Likewise diagrams showing the same comparison for the whole army at home and abroad.

These several diagrams give the comparison of the life of the soldier with the life of the civilian at the same ages in time of peace.

There is another set of diagrams showing the same comparison in time of war.

Two other diagrams exhibit the chief classes of disease in both sets of diagrams. We are thus enabled better to understand how far it is within the power of preventive science to diminish the risks to which the soldier is exposed, whether at home or in the field.

Diagram A. shows the relative mortality of the foot guards and of the English male population at the corresponding ages.

Diagram A.
Table A &
B.

It must be remembered that the Guards are physically the very select out of the population. Any impediment or disease is enough to prevent a man being taken for military service; and none but the strongest and best looking recruits are accepted by the Guards. The young guardsman is in every sense a "picked" life, and would be considered as a first-class life by any insurance office.

As soon as the recruit enters the service he is placed under the entire control of educated officers: his diet, cleanliness, personal habits are strictly attended to: he is lodged in barracks which have cost the country far more than was the relative cost of the house in which he was brought up: he never leaves the country in time of peace, but passes from his town quarters in London to his country quarters at Windsor or at Chichester, and whenever he suffers from the slightest ailment his medical adviser is instantly beside him: he has hospital accommodation, medicine, attendance, and every necessary comfort immediately.

One would say that of all men a soldier in her Majesty's Guards was the most likely to enjoy perfect health and long life.

The men that were rejected when the guardsman was selected have passed back into civil life. The civil population has lost a certain proportion of its good life which has gone into the army, and it has received back those lives which were not good enough for the army. The civil population has had all the loss, the army all the gain.

Let us now see how the Guards die off under the, apparently, very favourable circumstances mentioned.

Diagram A. consists of alternate black and red lines of different lengths. The black lines show the proportion of deaths per annum among 1,000 of the civil population for each five years from 20 to 40. The red lines show the proportion of deaths per annum among 1,000 Guards for the same ages. The excess in length of the red line over the black line in each pair of lines shows the excess of deaths among the Guards. There is, however, an important difference between the relative value of the black and red lines which must be noticed, otherwise the mortality in the Guards, great as it is, might appear less than it really is. The black line exhibits all the deaths in the civil population which occur between the ages of 20 and 40, but the red line does not exhibit all the deaths which occur among the men who had been selected for the Guards. Every year between the ages of 20

and 40, men are rendered unfit for service by organic disease, and are discharged to die among the civil population and to raise its rate of mortality. These are included in the black line, and are consequently not shown in the red line. These deaths are in fact deducted from the length of the red line and added to the length of the black line, so that in the comparison the Guards have a double advantage from their men who die invalided.

The Guards, though the most unhealthy corps on the home service, is not the only one which suffers a great excess of mortality. All the army on home service suffers, though in a somewhat less proportion.

This is shown in Diagram B., where the black lines again exhibit the mortality among the general English population, and the red lines the mortality among soldiers on home service. The excess of length in the red lines shows the excess of mortality among the troops, subject to the same correction as to invaliding as has been already mentioned for the Guards.

The whole army, like the Guards, consists of carefully picked lives. To show the full bearing of this fact in any comparison between the health of the army and that of civilians, it is necessary to state that, of the civil population at the recruiting age, a certain part is unable from illness to present itself to the recruiting officer: that deaths among that part go to raise the civilian mortality: that of those who do present themselves for recruits, a third part at least, though probably a much larger proportion, are rejected as unfit for service: that of those rejected at least a fourth part are suffering from diseases which shorten life. The lives rejected are thrown back into the general population; but notwithstanding this process of selection and the apparently favourable circumstances under which the troops are placed, we have from some cause or other the extraordinary results exhibited by these diagrams.

The wide extent of the British Empire, and the great variety of climates it presents, as well as the topographical peculiarities of our various colonies and possessions scattered over the whole earth, would lead us to expect a higher rate of mortality among soldiers born in the British Islands, when these soldiers are sent on service abroad, than would exist among the home population at the same ages.

This difference is represented in Diagram C., which exhibits the mortality among Englishmen of the army ages, living in healthy districts, and the mortality of the whole army at home and abroad for the same period, subject to the same correction for invaliding.

Diagram D. shows the same fact with regard to the army and the general male population of England at the army ages.

In some years it will be found that the mortality in the troops is from 5 to 6 times greater than it is in civil life, as represented on Diagram C.

These facts are represented in another way in Diagram E., each parallelogram of which represents the total sum of life among 10,000 men, between 20 and 40 years of age, entering the army and remaining on home service, and among the same number of Englishmen taken, first, all over the town and country districts, and, secondly, in the healthy districts at home at the same ages. The left-hand line of each parallelogram shows that all start alike; but the black wedge, which represents the progress of death among the various classes, it will be observed has a very different slope in each separate parallelogram.

The proportion of death increases and that of life diminishes, in a very different ratio and to a very different extent in each.

The mortality is greater, and its progress more rapid among the English male population generally than among that in healthy districts.

The general population has lost a third more by the time it arrives at the age of 40, than the healthy population has, while the soldiers have lost above a third more of their numbers than the general population, and more than twice as many as the healthy population.

Each parallelogram also represents the total money value of 10,000 men between the ages of 20 and 40, as well as the loss of value from loss of life at each succeeding year between the two ages. It further shows the relative value of the amount of life in the army as contrasted with that of two classes of civil population, passing on from 40 years to the succeeding period of life, from which it will be seen that while among healthy civil populations about 8,500 lives out of 10,000 survive the wear and tear of the ages between 20 and 40, and thereafter add their quota to the wealth of the community, only 6,900 of the army lives are available for the same purpose.

It may be said that the nation loses the money value of the excess of mortality existing in its general population over that of the population in healthy districts.

In the case of the army, the country incurs great expense in educating the soldier for his duties, and it is difficult to estimate the value of a good soldier, for he can hardly be replaced. In the present state of sanitary knowledge, it may be fairly stated that the whole excess of money loss between that in healthy districts and that in the army, as represented by the difference in area of the black wedges, might be saved to the tax-payers of the country. The general community incurs a still further loss of productive labour, because it will be seen that the number of lives at 40 years of age returned into the general civil population (supposing that the average age of discharge from service is 40 years), is much smaller in the army than the proportion which survives in the healthy civil population; and the productive power of the country is further taxed for the support, by poor-rates and otherwise, of a large proportion of men, temporarily or permanently disabled by diseases contracted in the service.

The loss from invaliding has been already referred to as a serious cause of inefficiency in the army not shown in any of the preceding diagrams. Diagram F. has been constructed from Tables F—*a*, F—*b*, F—*c*, and F—*d*, to bring under one view the whole loss sustained. This is shown in No. I., on which the black wedge represents the deaths, the yellow wedge the loss from invaliding, and the two wedges conjoined the total loss from both causes in an army of 200,000 men between the ages of 20 and 40. No. II. represents what the loss would be if the army were as healthy as the civil male population, and by comparing the red areas of both diagrams the great loss of efficiency in the army in its present state becomes more apparent. Under the present system No. I., 10,000 annual recruits would be required to sustain a force of 141,764 men, while under the improved conditions as to health indicated on No. II., 10,000 annual recruits would sustain an army of 166,910 men.

These diagrams then show the loss of life, of service, and of money value entailed on the country by the neglect of sanitary measures in the army in time of peace.

It is in the highest degree important to show the classes of disease from which the great losses in the army in time of peace arise, for it is in this way alone that we can ascertain whether, and to what extent, we can mitigate or prevent these diseases by known sanitary precautions.

The two parallelograms on Diagram G. represent the classes of mortality from disease most prevalent in the infantry on home-stations, as compared with the extent of the same types of disease in civil life at the same ages.

The excess of length in the army parallelogram shows the total excess of mortality in the infantry over that in the civil population.

We are at once struck by the remarkable fact that more than seven-ninths of the mortality in the infantry are due to two classes of disease alone,—namely, to zymotic diseases, such as fevers, cholera, diarrhœa, and to chest and tubercular diseases, such as consumption, &c.

In fact the mortality from chest and tubercular diseases alone, in the infantry on home service, exceeds the total mortality from all causes among the civil population at the same ages; while the deaths from zymotic disease are above double what they are in civil life. Again, chest and tubercular affections are the scourge of the civil population, and yet the civil population suffers less than one-half the mortality from these diseases that occurs in the infantry, while the deaths from zymotic disease in the infantry nearly equal the total deaths from chest affections in the civil population. It is necessary here also to repeat that while the area in Diagram G. representing the mortality of the English male population, exhibits all the deaths from each class of diseases, the area representing the infantry mortality does not. It takes no account of men discharged by reason of chronic, tubercular, and chest diseases, whose deaths, taking place after discharge among the civil population, go to swell the mortality from these diseases, such as it is shown in the area which represents the civilian mortality.

These diagrams, then, exhibit clearly the frightful mortality continually going on in the British army, and the classes of disease to which this mortality is to be attributed.

The first question which arises on looking at these diagrams is,—what can be the cause of all this? By what possible procedure can it be that the élite of the British working population can be so guided as that such a result shall follow? Is there anything in the food, clothing, duties, habits of the men to which it can be attributed? Are the army medical men less skilful in their profession than those in civil life? To every such query we must reply that there is, on the contrary, everything in the soldier's favour in these particulars, except, perhaps, that he is not sufficiently worked. His barrack accommodation has cost the country enough of money. There has been no expense spared in that. Can there be anything there to occasion such fearful annual loss of life?

Let us see what sanitary experience teaches as to the causation of the diseases from which the soldier suffers.

1st. *Consumption and diseases of that class* are the result of breathing foul air contaminated by the breath of other persons. It is air polluted in this way which appears to be the special agent which predisposes people to consumptive diseases. How is such a state of the air chiefly produced? Very easily:—simply by crowding too many people into unventilated rooms, especially into sleeping-rooms.

If barrack-rooms are crowded and unventilated, and if the atmosphere is close or foul during the hours of sleep when the system is more peculiarly predisposed to its effects, then you have the elements of consumption and tubercular disease. If you want to develop the seeds into activity, all you have to do is to take the men out of such an atmosphere which they have been breathing night after night, and expose them on guard to wet and cold, and the disease will soon develop itself.

But mark,—exposure to wet and cold alone will not do it. The Crimean experience proved this; and so it is found to be daily and nightly, in night trades and occupations, except in the case of the soldier.

To know whether the conditions requisite to produce consumption and tubercular disease exist in barracks, it is only necessary to read the disgusting evidence given before the Barrack Committee, and the statements in this Report on the subject, or simply to consult the tables in the Appendix showing the amount of cubic space allowed to the men in barracks, and to the sick in military hospitals. It would be

difficult to frame conditions more likely to generate such diseases than those to which soldiers are exposed in barrack-rooms. They are in fact the self-same conditions as have been determined by direct experiment to be necessary for the production of tubercular disease in animals.

When a sufficient cause is found it is not necessary to look for another.

2nd. *Zymotic diseases*, namely, *fevers, diarrhoea, cholera, dysentery, &c.*, are known in civil life to be most intense in their activity where certain local conditions are present—

First in prominence amongst these conditions, we have again overcrowding and defective ventilation,—the repeated breathing, in fact, of air already breathed, such air being further contaminated by moisture and exhalations from the skin.

Next we have emanations proceeding from animal excretions, or from decaying vegetable matter together with moisture. The want of drainage and the foul state of the latrines and urinals in many barracks, as described in the Report, are sufficient illustrations of this class of causes.

There are others of minor importance which need not be mentioned. Those enumerated are quite sufficient to account for most of the excess of zymotic mortality from which the army on home-stations suffers. If men returning from foreign service happen occasionally to be more susceptible to the operation of such causes, they will of course suffer more severely; but allowance is made in the diagrams for even this contingency, as they do not exhibit any deaths occurring for the first six months after men have returned from foreign service.

The next query is one which it is almost superfluous to put. It is whether there be any known means of diminishing this excessive mortality; and whether there be any hope of reducing the lines of disease and mortality among the troops, as exhibited in these diagrams, to the same length as the lines for the civil population?

The reply is, that the line of the soldier's mortality on home service should, to say the least of it, never have been longer than that of the civil population, and that it might be shorter. The parallelogram showing the mortality and disease among the civil population on Diagram G., is the very one towards the reduction of which to smaller dimensions the whole sanitary procedure under every sanitary Act of Parliament is directed. It was the large dimensions of such parallelograms that led to the agitation which ended in the legislature giving a sanitary code to England. And it is hardly credible that it should be necessary at the present day to advocate similar measures for the army.

There is no reason why with proper sanitary measures the general health of the population should not be raised to the standard of the most healthy districts of the country, as indeed it has been in certain marked instances. And why should the health of the army on home service be any exception, seeing that the personal conditions of the soldier are so much more favourable? If this were done, and if our home army consisted of 100,000 Guards, we should save nearly 1,500 good soldiers per annum, who from all experience in other cases are as certainly killed by the neglects specified as if they were drawn out and shot.

By referring back to Diagrams C. & D., which represent the army mortality at home and abroad, as compared with that of an English population at the same ages, we cannot fail to be struck with the immense loss of life entailed on the army, and the corresponding cost to the country from foreign service. This loss is much less than it was in former times. It has been diminished by various sanitary means; and there is no reason whatever, why, if intelligent inquiry were instituted, and proper sanitary precautions taken, all the lines of army mortality on those melancholy tables might not be materially shortened.

Unfavourable as those diagrams are to the sanitary system, or rather want of system, in the British army, they exhibit results which might be considered as in the highest degree favourable when contrasted with the mortality from disease among the British troops in time of war.

It is at such times that the excessively defective state of sanitary science and practice in the army becomes pre-eminently remarkable, and leads to the most disastrous results. It is right, however, to state that such defects are not confined to the British army. All armies during war have suffered from the neglect of very ordinary hygienic precautions, and some armies have been all but destroyed in consequence. Nearly sixth-sevenths of the vast army with which Napoleon the First invaded Russia had perished, or ceased to be effective before the setting in of the fierce cold which destroyed the remainder.

The actual losses in battle form a very small part of the calamities of a long war, so much so, that if the excess of mortality caused by disease could be cut off, the loss in action, would be hardly worthy of remark in the comparison.

The facts connected with the disastrous Walcheren expedition, as well as the ignorance and absence of the most ordinary precautions which led to so great a loss of life, are matters of history. But up to the present time the experience of that expedition appears to have led to no beneficial result, so far at least as can be gathered from the still more disastrous Crimean war.

The linear Diagram H. gives the comparative results of the mortality amongst the English male population of the army ages, and amongst the soldiers of the British army in the East. The first short black line gives the mortality from all causes among the English population. The second long red line, nearly twenty-three times the length, gives the mortality in the army. For every Englishman of the army ages who died at home, nearly twenty-three died in the East. The proportion of deaths from wounds, exclusive of those killed on the field, during the war, was thirty times greater among the soldiers than among the civil population; but even at that rate the mortality in hospital from wounds did not exceed 3 per cent. of the force, while the deaths from all causes were nearly 23 per cent. of the force in the field.

When we examine the cause of this great mortality, the eye is arrested at once by the second long red line marking the zymotic deaths. The short black line immediately above it shows the corresponding mortality from zymotic diseases among the home male population at the same ages.

We learn from these two most instructive lines, that for every man of the ages and numbers who died at home from zymotic maladies, 93 died in the army in the East! The remaining diseases shown in the diagram are not worth notice. If they were all expunged, and the deaths from wounds taking place in hospital expunged with them, the fact would remain that the army in the Crimea almost perished from zymotic disease.

The awful mortality in that noble army is shown still more strikingly by Diagram I. For the sake of comparison, the town of Manchester, one of the most unhealthy in England, and one very subject to zymotic diseases, has been selected. The small black disc in the centre shows what would have been the mortality of the Crimean army, had it had been as healthy as Manchester. Now contrast with this the great black bat's wing on the right-hand of the diagram. The whole of that black area outside the small innermost circle shows the excess of mortality in the army over that of one of the most unhealthy towns in England.

The diagram is in two parts. The right hand part shows the mortality of the army during the first twelve months of the war from April 1, 1854, to March 31, 1855.

It shows how healthy the army was when it landed in the East. By comparing the dates, it will be seen

Diagram
H.
H—
b.

Diagram

that, immediately on the army reaching Varna, sickness and death began to increase, showing the sudden exposure of the troops to some very unusual causes of mortality. It will be seen, that the whole time the army was in Bulgaria, it suffered severely—that the mortality declined when it left that pestiferous region for the Crimea—that from the moment it broke ground before Sebastopol, in a comparatively healthy district of country, the mortality began to rise during October—that it progressed with frightful rapidity during November and December, attaining, during January 1855, an amount greater than the maximum of the mortality of the great plague of London in September 1665.

The diagram gives a pictorial representation of that great Crimean calamity during the first year of the war. Except, perhaps, in one or two of the mediæval epidemics, no pestilence of which we have any record would form such a picture for eight consecutive months.

The left-hand diagram gives the mortality of the second year of the war. It was great, as will be seen by constrasting its black irregular surface with the small Manchester circle, but when compared with the first year's mortality it is insignificant. It will be seen that for the last three months (but in reality for the last six months, January to June 1856 inclusive) the mortality retires within the Manchester circle and all but disappears. We have here at a glance the vital statistics of the Crimean war.

The immense preponderance of zymotic diseases has been already referred to, and a glance at Diagram K. will show that these diseases were the cause of the whole catastrophe. The total mortality from wounds at Alma, Inkermann, and during five months in the trenches, exclusive of the killed in action, is all comprised in the small pink cone in the centre. The small black patch adjacent comprehends the total mortality from diseases not zymotic. The irregular blue surface, like the tail of a portentous comet, shows the zymotic diseases, the pests and scourges of camps and armies now, as they were of cities and towns in the middle ages, before the dawn of sanitary knowledge.

The analysis of the second year's mortality is given on the left-hand circle of Diagram H. It exhibits an immense reduction in the deaths from all causes except from wounds, the legitimate result of war; but even to the end the zymotic mortality retains its preponderance, and only disappears when the army had arrived at its most healthy condition.

On comparing the total mortality as shown on Diagram I. with the zymotic mortality in Diagram K., it will be seen that the very first diseases from which the army suffered (as shown by the dates) in Bulgaria were zymotic diseases. They were principally fever and cholera, brought on by neglect of sanitary precautions chiefly in the first bad selection of camp sites. The first outbreak began to subside only in September, and continued to decline until the army sate down before Sebastopol. Another and far more terrible invasion of zymotic disease followed that event.

The men were hard worked, but hard work by itself never induced zymotic disease. We must look for other causes, and these causes once existing, fatigue would co-operate powerfully with them. The men had no sufficient shelter. They were in want of clothing suitable to the weather. They suffered from wet and damp. They were exposed to the elements at all times and seasons. Their food was not sufficiently nutritious nor varied. They had no proper means of cooking, and little or no fuel, and they could not eat their rations. What wonder, then, if their very blood got into a disordered state, and zymotic maladies broke out among them? Scurvy and scorbutic diseases appeared at a very early period. Fever, cholera, diarrhœa, dysentery increased, so as to threaten the total destruction of the force. The requirements of hygiene had been disregarded, and these diagrams show the natural results.

During the summer of 1855, as shown on the left-

hand diagram, zymotic diseases still prevailed, though to a comparatively insignificant degree. Sanitary defects in draining, cleansing, and ventilation, and over-crowding were then the prevailing causes of attacks. During the winter of 1855-1856 all the previous causes of disease had been removed. The men were well clothed, fed, and sheltered. Their huts were properly drained and ventilated, and nuisances had been removed. The hard work had also ceased.

Compare, then, the right with the left-hand diagram from the months of September to April; and no more instructive lesson on army hygiene could be given. The men were the same, the conditions only had been altered. The requirements of nature had been disobeyed in every particular during the first winter, and she has left on that diagram an everlasting vindication of her broken laws. During the second winter, nature had been more perfectly obeyed, and the stigma of her displeasure has almost ceased to appear.

In discussing the causes of the terrible mortality of that fearful winter, we must not overlook another important point, namely, what chances a sick man had of proper care and treatment.

The medical staff, it is known, exerted itself to the very utmost, and incurred a large proportionate mortality among its members in consequence. But the accommodation for the sick in camp was for several months most defective. There were no proper hospitals, and no suitable beds or other appliances. The suffering from exposure among the sick was perhaps greater, considering their diseased state, than among the army generally.

The transport-ships were most defective at first, over-crowded and badly ventilated, and, moreover, many cases were shipped in an unfit state for removal, particularly cases of choleraic disease. There was a great mortality on board the ships in consequence. During the period of $4\frac{1}{2}$ months from the landing in the Crimea, to the end of January 1855, out of 13,093 sick shipped for Scutari, 976 died on a passage of only 300 miles, which is 75 per thousand. In January 1855, there were actually lost on the passage 10 to every 100 received alive. Of those who landed, two were lost out of every five treated in the hospitals of the Bosphorus, during the month of February, and one out of every two at Koulali, the worst of all the hospitals; for, when the sick arrived they were crowded into buildings which had undergone no sufficient sanitary preparation for their reception. The drainage, ventilation, lime-washing, and other arrangements were so defective that the buildings were little better than pest-houses, and the result was, an enormous and needless mortality among the sick, which went to swell the losses of the army, and to raise its proportionate rate of mortality.

The Scutari mortality was in fact a separate problem and must be considered by itself. It was the case of thousands of sick removed 300 miles from the causes which had occasioned their disease, and exposed to another class of risks in the buildings into which they were received. The buildings were spacious and magnificent in external appearance; far more so indeed than any military buildings in Great Britain; and several of them to all appearance were better suited for hospitals than any military hospitals at home.

The mere external appearance was, however, fatally deceptive. Underneath these great structures were sewers of the worst possible construction, loaded with filth, mere cesspools in fact, through which the wind blew sewer-air up the pipes of numerous open privies into the corridors and wards where the sick were lying.

The wards had no means of ventilation, the walls required constant lime-washing, and the number of sick placed in the hospitals during the winter was disproportionately large, especially when the bad sanitary state of the buildings is taken into consideration. The population of the hospitals was increased, not only without any sanitary precautions having been taken, but while the sanitary conditions were becoming

daily worse, for the sewers were getting more and more dangerous, and the walls more and more saturated with organic matter. Some slight improvements were made in the beginning of March 1855, but it was not till the 17th that effectual means were put into operation for removing the causes of disease in the buildings. By the end of June the improvements were nearly completed, and the proportion of sick had fallen off.

Diagram
K.
Table K,
fig. 2.

The small diagram (fig. 2) on Diagram K. shows the whole history of that frightful Scutari calamity. It exhibits the annual rate of mortality *per cent.* on the sick population of the hospitals. It will be observed that even from the very commencement of the occupation of these buildings in October 1854, and before the sufferings of the winter had begun, the mortality was very high, although the number of sick was small, indicating the unhealthy state of the buildings from the very first. Nothing was done to improve them even then; only fresh shiploads of sick were passed into them. The mortality of course continued to advance. Still nothing was done. Then came the great Crimean catastrophe, and ship after ship arrived with sick in so susceptible a condition that the foul air of these hospitals was almost certain death to them, and accordingly, as the diagram shows, they died, in the month of February, at the rate of 415 *per cent.* per annum. In 12 months at such a rate the whole sick population of the hospitals would have perished four times.

The reduction in the mortality after the sanitary works were begun is most striking, and it falls eventually in June 1855 to less than a sixth part of what it was when the barrack and general hospitals were occupied together in October 1854, and to a nineteenth part of what it was in February 1855. Our general hospitals have been so deplorably mismanaged in all our wars that the question has been raised as to whether it would not be better to do without them altogether. The experience of Scutari, as shown on the diagram, proves that general hospitals may become pest-houses from neglect, or may be made as healthy as any other buildings.

The question of these zymotic diseases is of infinitely greater importance during war than during peace, for no weapons are so destructive of armies in the field as they are. The slaughter of battles and sieges is cast into the shade by that of pestilence, which during long wars is the real arbiter of the destinies of nations, for it exhausts their resources more completely than all other losses in the field.

In a country like ours with a limited population, an entirely voluntary system of recruitment, and colonies and possessions in all climates and latitudes, the question of military hygiene is rapidly becoming a question of vital importance to the interests of the empire. Upon the British race alone the integrity of that empire at this moment appears to depend. The conquering race must retain possession. Experience has shown that without special information and skilful application of the resources of science in preserving health, the drain on our home population must exhaust our means. The introduction, therefore, of a proper sanitary system into the British army is of essential importance to the public interests.

The Crimean experience has proved the whole case, both as regards the disastrous results of defective administrative arrangements, and the possibility of foreseeing and obviating similar evils in future.

And it has, moreover, shown that, with troops like ours, whose bravery and uncomplaining endurance of hardships the most severe and fatal, have been the admiration of the world, England has nothing to dread but the results of her own inexperience and want of foresight.

DIAGRAM Z.

Illustrative of the Quartermaster-General's Regulations for Encampments.

Diagram
Z.
Table Z.

Diagram Z. is introduced to illustrate an important sanitary principle in camping troops, viz., the relative

density of the population of a camp according to the number of tents pitched on a given area of ground.

The Quartermaster-General's "Regulations for Encampments" of 11th May 1853, contain three plans for encamping a battalion 850 strong.

In plan No. 1, 60 tents are arranged in 10 lines of 6 tents to a line. Four of the lines are double, and there are two single lines.

Plan No. 2 shows a "compressed" order in which the tents are arranged in 10 double lines of three tents to a line.

Plan No. 3 has the tents arranged in 10 equidistant lines of six tents to a line.

Fifteen men are allotted by the regulations to each tent.

The occupied area in Plan No. 1, measured from the outer margin of the tents, is $210 \times 36 = 7,560$ square yards.

In plan No. 2, it is $220 \times 18 = 3,960$ square yards.

In plan No. 3, the area occupied is the same as in No. 1, viz. 7,560 square yards.

In all the plans the areas given include the spaces between the tents, and they correspond to what are called the "built" and "unbuilt" areas in towns.

Plans Nos. 1 and 2 are so arranged that each double line of tents corresponds to the "built" area of a town, and the intervening spaces would represent the "unbuilt" area.

In plan No. 1 the area absolutely covered by two lines of tents, six in a line, and 2 yards between the lines is, yards $14 \times 36 = 504$ square yards.

In plan No. 2, six tents in two lines touching each other, cover a space $= 12 \times 18 = 216$ square yards.

The following on these data, would be about the population on the area of the camps reduced to a common unit:

Plan No. 1	=	348,000	per square mile.
" "	2	=	664,000 " "
" "	3	=	347,000 " "

The occupied areas alone, without the open spaces intervening between the rows of tents, are as follows:—

Plan No. 1	=	1,044,820	per square mile.
" "	2	=	1,290,000 " "

Sanitary principles of great importance are involved in the question of density of population upon a given area, and the whole subject has accordingly attracted considerable attention, more especially as it has been found that, other things being equal, the sickness and mortality among given populations bear a certain ratio to the density. The most densely peopled towns and districts are generally the most unhealthy. The prevailing diseases are fever, cholera, diarrhoea, consumption, and other diseases connected with atmospheric pollution. The air circulates less freely in densely populated districts, and the amount of organic refuse to be removed is, of course, much greater in proportion to the area where the population is more densely crowded than where such is not the case.

Inquiries into the density of town populations have shown that the densities vary from 10,000 or 12,000 inhabitants per square mile on the "built" and "unbuilt" area to 175,000 per square mile. In certain districts the population on the "built" area greatly exceeds these estimates.

Diagram Z. shows the comparison between the density of population on the built and unbuilt area of the whole of London and on the Quartermaster-General's plans. Each point represents a human being; the angular spaces the area allotted to each in the different densities, and the blue lines the distance from person to person.

It will be seen that the least crowded of the Quartermaster-General's plans affords about a twentieth part of the area per man allotted to each inhabitant of the metropolis; that it is about half the amount of that in the most densely peopled part of London; and that the population on the *occupied area* of the camp is above 50 times more crowded than the population of London.

If the metropolitan area were equally crowded as the camp No. 3 on the diagram, it would contain 42,000,000 of people.*
If crowded as No. 2, it would contain 81,000,000.
And if the metropolis were as crowded as the occupied area shown in the diagram, it would hold 127,000,000, or about four times the population of the three kingdoms!

These comparisons will be sufficient to show the

* The number of square miles within the area of the metropolis is 121.92
Square Mile. Persons. Square Miles. Persons.
Then as 1 : 347,000 :: 121.92 : 42,000,000 nearly.

great importance of this element of over-crowding to the health of camps. A great part of the disease and mortality in towns is due to its operation, and there can be no doubt that in camps formed of unventilated tents and huts, and overcrowded to such extreme degrees of density, it is one of the most powerful operative causes of camp diseases.
It may be sometimes necessary in war to overcrowd camps, but it is evidently a measure only to be resorted to under pressing necessity, for camps can only be crowded by a considerable sacrifice of the force from disease.

TABLES A. and B.

TABLE showing what would be the Mortality of the British Army if the Rates were the same as those in (1) The Household Cavalry, (2) Dragoon Guards and Dragoons, (3) Infantry of the Line, (4) Foot Guards.

Ages.	Effectives of the British Army.	Deaths in the British Army at Home if the Mortality were the same as in						Ages.	Rate of Mortality per 1,000.					
		Numbers living in 1851.	Household Cavalry.	Dragoon Guards and Dragoons.	Infantry of the Line.	Foot Guards.	Total of the British Army at Home.		Household Cavalry.	Dragoon Guards and Dragoons.	Infantry of the Line.	Foot Guards.	Total of the British Army at Home.	
Total	-	136,277	1,498	1,818	2,545	2,776	2,381	Total	-	11.0	13.3	18.7	20.4	17.5
Under 20	-	11,911	90	99	157	133	146	Under 20	-	7.5	8.3	13.1	11.2	12.2
20—25	-	50,387	588	626	896	1,087	858	20—25	-	11.7	12.4	17.8	21.6	17.0
25—30	-	38,242	394	547	758	806	702	25—30	-	10.3	14.3	19.8	21.1	18.3
30—35	-	22,099	293	326	438	431	406	30—35	-	13.3	14.8	19.8	19.5	18.4
35—40	-	10,005	84	153	211	224	193	35—40	-	8.4	15.3	21.0	22.4	19.3
40 & upwards	-	3,633	49	67	85	95	76	40 and upwards	-	13.4	18.3	23.4	26.2	21.0

The annual deaths among the 136,277 effectives of the British Army at home and abroad, if the mortality were the same as in the *Household Cavalry*, would be 1,498; in the *Dragoon Guards*, 1,818; in the *Infantry of the Line*, 2,545; in the *Foot Guards*, 2,776; and in the *Men of All Arms* in the British Service, 2,381.
The annual rate of mortality to 1,000 of the *Household Cavalry* is 11.0; of the *Dragoon Guards* 13.3; of the *Infantry of the Line* 18.7; of the *Foot Guards* 20.4; and of the *Men of all Arms* in the British Service at Home 17.5.
If the 136,277 soldiers had been subject to the rate of mortality which prevails in the healthiest districts of England, the annual deaths would have been 1,051; in one of the unhealthiest cities (*Manchester*) 1,688; and in all England 1,248.
NOTE—The numbers of men living in the British Army in 1851 were obtained from the *Census Report of 1851*. Vol. I. (Occupations) p. ccclxvi.

TABLE C.—a.

TABLE showing the Average Strength, Deaths, and Rate of Mortality in each Year, from 1839 to 1853, of the Officers, Non-commissioned Officers and Men, serving in the Army at Home and Abroad, exclusive of Artillery, Royal Engineers, West India and Colonial Corps.

Years.	AVERAGE EFFECTIVE STRENGTH.			DEATHS.			ANNUAL MORTALITY TO 1,000 LIVING.			Annual Mortality to 1,000 living of Men of the Soldiers' Ages, taken on Average of Five Years, 1849–53.	
	Officers, Non-Commissioned Officers and Men.	Officers.	Non-Commissioned Officers and Men.	Officers, Non-Commissioned Officers and Men.	Officers.	Non-Commissioned Officers and Men.	Officers, Non-Commissioned Officers and Men.	Officers.	Non-Commissioned Officers and Men.	In England and Wales.	In Healthy Districts.

Total and Average 1839–53	1,844,130	82,093	1,762,037	59,512	1,373	58,139	32.3	16.7	33.0	9.2	7.7

TABLE C.—b.

NUMBER OF DEATHS OF NON-COMMISSIONED OFFICERS AND MEN, showing also the Number of Deaths that would have occurred if the Mortality were 7·7 per 1,000, such as it was among Englishmen of the Soldier's Age in healthy Districts, in the Years 1849–53, which fairly represented the Average Mortality.

Years.	Deaths that would have occurred in Healthy Districts among Males of the Soldier's Ages.*	Actual Deaths of Non-commissioned Officers and Men.	Excess of Deaths among Non-commissioned Officers and Men.
1839	763	2,914	2,151
1840	829	3,300	2,471
1841	857	4,167	3,310
1842	888	5,052	4,164
1843	914	5,270	4,356
1844	920	3,867	2,947
1845	911	4,587	3,676
1846	930	5,125	4,195
1847	981	4,232	3,251
1848	987	3,213	2,226
1849	954	4,052	3,098
1850	919	3,119	2,200
1851	901	2,729	1,828
1852	915	3,120	2,205
1853	920	3,392	2,472
Total - -	13,589	58,139	44,550

The Table may be read thus:—In the year 1839 the number of deaths among non-commissioned officers and men was 2,914 out of the strength (98,912—see preceding table); whereas the deaths among the same number of men, of the same ages, in the healthy districts of England, would have been only 763; consequently the excess of deaths in the army amounted to 2,151.

* The exact Mortality among Englishmen of the Soldier's ages, in the healthy districts, is ·0077122, the logarithm of which (·8871801) has been used in making this calculation.

TABLE D.

NUMBER OF DEATHS OF NON-COMMISSIONED OFFICERS AND MEN, showing also the Number of Deaths that would have occurred if the Mortality were 9·2 per 1,000, such as it was among Men of the Soldier's Ages in England and Wales, in the Years 1849–53.

Years.	Deaths that would have occurred in England and Wales among Males of the Soldier's Ages.	Deaths of Non-commissioned Officers and Men.	Excess of Deaths among Non-commissioned Officers and Men.
1839	910	2,914	2,004
1840	989	3,300	2,311
1841	1,022	4,167	3,145
1842	1,060	5,052	3,992
1843	1,091	5,270	4,179
1844	1,098	3,867	2,769
1845	1,086	4,587	3,501
1846	1,110	5,125	4,015
1847	1,171	4,232	3,061
1848	1,177	3,213	2,036
1849	1,138	4,052	2,914
1850	1,096	3,119	2,023
1851	1,075	2,729	1,654
1852	1,091	3,120	2,029
1853	1,097	3,392	2,295
Total - -	16,211	58,139	41,928

This Table may read thus:—In the year 1839 the number of deaths among non-commissioned officers and men was 2,914 out of the strength (98,912—see preceding table); whereas the deaths among the same number of men, of the same ages, living in England and Wales, would have been only 910! Consequently the excess of deaths in the army amounted to 2,004.

TABLE E.—a.

(1) TWO LIFE TABLES deduced from the Mortality of Soldiers in the English Army at Home (2) and from the Mortality of the Males of England at the same Age, 1849–53.

(Facts relative to Soldiers, supplied by Sir A. Tulloch and Dr. Balfour's Report, 1853, p. 31.)

Facts relative to Englishmen, supplied by the Registrar General.

Age.	English Soldiers living.	Englishmen living.	English Soldiers dying yearly.	Englishmen dying yearly.	Excess of Deaths among English Soldiers at Home.
20	10,000	10,000	169	82	87
21	9,831	9,918	168	83	85
22	9,663	9,835	166	84	82
23	9,497	9,751	164	85	79
24	9,333	9,666	162	86	76
25	9,171	9,580	160	87	73
26	9,011	9,493	159	88	71
27	8,852	9,405	158	89	69
28	8,694	9,316	157	91	66
29	8,537	9,225	155	91	64
30	8,382	9,134	153	93	60
31	8,229	9,041	150	94	56
32	8,079	8,947	147	95	52
33	7,932	8,852	145	97	48
34	7,787	8,755	144	97	47
35	7,643	8,658	144	99	45
36	7,499	8,559	143	101	42
37	7,356	8,458	141	102	39
38	7,215	8,356	138	103	35
39	7,077	8,253	135	106	29
40	6,942	8,147			

The Table enables you to follow 10,000 soldiers, from the age of 20 to the age of 40; showing how many die in each year of age, and how many remain alive at the end of each year of age. Thus of 10,000 soldiers alive at the exact age 20, 169 die in the next year of age, leaving alive 9,831 at the age 21.

For the sake of comparison, 10,000 of the male population of England are followed through the same ages. It will be noticed that of 10,000 soldiers, 7,077 live to the age 39, out of whom 135 die in the next year of age; whereas out of 10,000 men of all trades and occupations, at the age 20, 8,253 attain the age of 39, and of these 106 die in the year of age following.

TABLE E.—b.

TABLE showing the Strength, Deaths, and Annual Rate of Mortality in the Household Brigade, and the Cavalry and Infantry of the Line, serving in the United Kingdom 1839–53; also showing what the Deaths would have been under more favourable Circumstances.

Years.	Strength.	Deaths.	Annual Rate of Mortality per 1,000.	Number of Deaths that would have occurred if the Mortality had been the same as it was among the Males at corresponding ages.		Excess of Deaths in Army at Home over the Deaths that would have occurred had the rate been annually.	
				In Healthy Districts	In England and Wales	7·7 per 1,000.	9·2 per 1,000.
1839	24,132	417	17·28	186	222	231	195
1840	19,159	321	16·75	148	176	173	145
1841	21,986	346	15·74	169	202	177	144
1842	23,019	360	15·64	177	212	183	148
1843	31,164	502	16·11	240	287	262	215
1844	37,265	635	17·04	287	343	348	292
1845	33,948	562	16·55	261	312	301	250
1846	30,280	577	19·06	233	279	344	298
1847	33,353	663	19·88	257	307	406	356
1848	37,766	629	16·66	291	347	338	282
1849	44,842	851	18·98	345	413	506	438
1850	36,794	479	13·02	283	339	196	140
1851	34,095	522	15·31	263	314	259	208
1852	35,067	469	13·37	270	323	199	146
1853	28,671	362	12·63	221	264	141	98
Total & Mean	471,541	7,695	16·32	3,631	4,340	4,064	3,355

The facts for this Table have been taken from the Tables No. LV. of Appendix. The Deaths from accident are included with the Deaths from disease.

F—a.

TABLE showing, of 10,000 Recruits at the Age 20, the Numbers remaining at each successive Year of Age up to 40, and also the Numbers annually eliminated by Invaliding or by Death.—It has been constructed from the facts supplied by the Army Reports and by the Paper of Dr. Balfour, on Invaliding. The principle of construction is the same as that employed at the General Register Office, in constructing Life Tables. It is assumed that the Soldiers enter the Service at the age of 20 years.

Age.	British Soldiers.				Completed Years of Service.
	Living.	Dying and Invalided.	Dying.	Invalided.	
20	10,000	350	169	181	0
21	9,650	325	168	157	1
22	9,325	305	166	139	2
23	9,020	289	164	125	3
24	8,731	278	162	116	4
25	8,453	270	160	110	5
26	8,183	265	159	106	6
27	7,918	264	158	106	7
28	7,654	263	157	106	8
29	7,391	266	155	111	9
30	7,125	271	153	118	10
31	6,854	275	150	125	11
32	6,579	282	147	135	12
33	6,297	288	145	143	13
34	6,009	296	144	152	14
35	5,713	302	144	158	15
36	5,411	307	143	164	16
37	5,104	313	141	172	17
38	4,791	315	138	177	18
39	4,476	318	135	183	19
40	4,158				

TABLE F.—b.

STRENGTH and Invaliding in the Army serving at Home, during the Years 1839—1853. (See No. LVIII. of Appendix).

Years Service.	Strength.				
	Household Cavalry.	Cavalry Line.	Foot Guards.	Infantry Line.	All Arms.
All periods of Service	18,114	87,129	73,720	308,409	487,372
Years.					
0—7	8,332	48,541	36,761	195,628	289,262

21 and upwards } - - - 648·46

24 " } - - - 648·46

TABLE F.—c.

PROPORTION OF TROOPS, serving at Home, who DIED or were INVALIDED out of 1,000 serving in the Household Cavalry, Cavalry, and Infantry in three septennial Periods of Service.

Ages.	Years of Service.	Deaths at Home.	Invalided at Home.	Invalided and Deaths.
		to 1,000 serving.		
20—27	0—7	17·41	15·19	32·60
27—34	7—14	18·31	20·34	38·65
34—41	14—21 or 24	19·15	43·98	63·13

The Table may be read thus:—To 1,000 Troops who have served under 7 Years, of the Ages 20 and under 27, 17·41 DIE, 15·19 are INVALIDED, and 32·60 DIE OR ARE INVALIDED annually.

NOTE.—Table F.—a. was constructed from the facts in Tables F.—b. and F.—c.

F.—d.

TABLE showing the Number of Effectives (distinguishing Young Soldiers from Veterans) remaining (1) in the Army as it is; (2) in the Army in an Improved State—if the Number of Annual Recruits were 10,000, and the Army served only at Home in a time of Peace.

—	Years of Service.	Ages.	To 10,000 Annual Recruits.		Excess of Strength in the Army in an Im- proved State.
			Army in its present Sanitary State.	Army in an Improved State.	
			Upon the above hypothesis.		
Effectives - -	0—20	20—40	141,764	166,910	25,146
Young Soldiers -	0—10	20—30	84,888	92,305	7,417
Veterans - -	10—20	30—40	56,876	74,605	17,729

The Table is intended to show more particularly the large number of Veterans lost to the Army as it is at present constituted:—Thus in the Army as it is, the number of Young Soldiers at the Ages 20—30 is 84,888, and of Veterans of the Ages 30—40 56,876, while in an improved state the numbers would be respectively 92,305 and 74,605, showing an addition to the strength of the Army of 7,417 Young Soldiers and 17,729 Veterans.

The number of Veterans actually in the Army, owing to Service in unhealthy stations abroad, is much less than in either of the above estimates; in 1851, of 120,733 men, 88,629 were of the Age 20—30, and only 32,104 were 30—40.

TABLE G.

DEATHS and ANNUAL RATE of MORTALITY per 1000 Living, from, all Causes, Zymotic Diseases, Chest and Tubercular Diseases, and all other Diseases, amongst the English Male Population Aged 15—45 (1848—54), and amongst the Infantry of the Line serving at Home (1837—46.)

Causes of Death.	Deaths.		Annual Rate of Mortality per 1,000 living.	
	Of Males aged 15 to 45, in England and Wales, during the 7 Years 1848—54.	Infantry of the Line serving at Home during the 10 Years 1837—46.	Of Males aged 15 to 45, in England and Wales, during the 7 Years 1848—54.	Of Infantry of the Line serving at Home during the 10 Years 1837—46.
All Causes -	283,167	2,865	9·8	17·9
Zymotic Diseases -	56,347	659	2·0	4·1
Chest and Tubercular Diseases -	130,753	1,612	4·5	10·1
All other Diseases (including Violent Deaths) -	96,067	594	3·3	5·7

Males aged 15—45 living in England and Wales in the middle of 1851 } 4,130,331
Aggregate Strength of Infantry of the Line (serving at Home) in 10 Years, 1837—46 } 160,103

NOTE.—The deaths in England and Wales (1848—54) are taken from the 18th Annual Report of the Registrar-General, p. 150,

and the population (1851) from the Census Report, "Occupations," vol. I., p. clix. The deaths and aggregate strength of the infantry of the line (1837-46) are taken from Sir A. Tulloch's report on the health of the army for 1853, pp. 9, 62. At p. 9, in addition to the 2,683 deaths from disease (p. 62), are returned the particulars of 127 deaths by violence: leaving, however, 55 deaths unaccounted for. 2,683 + 127 + 55, make the above 2,865 deaths.

Bronchitis and influenza have no place in the army nomenclature. The chronic catarrh of the army returns is believed to be really phthisis, in the great majority of cases; acute catarrh comprehends probably both epidemic catarrh, or influenza and bronchitis. The 55 deaths from acute catarrh have been treated as influenza and referred to zymotic diseases. The deaths from tubercular and chest diseases comprise scrofula, 24 (including apostema lumbare, 10; hydrarthrus, 1); phthisis, 1,241; hæmoptysis, 36; chronic catarrh, 135; hydrocephalus, 2; asthma, 2; dyspnea, 7; pleurisy, 10; pneumonia, 155. The zymotic diseases are, as far as the nomenclature allows, the same as those enumerated in the Registrar-General's 16th Annual Report, pp 83-5 of the Appendix.

TABLE H.—a.

MORTALITY in the ARMY of the EAST in Hospital during 2½ Years, from April 1st, 1854, to June 30th, 1856.

Period.	Years of Life or aggregate Strength.	Average Strength of the Army.	Deaths.	Annual Mortality per Cent.
April 1st, 1854, to June 30th, 1856, (2½ years)	79,273	34,526	18,057	22·78

Note.—The years of life and the average strength of the Army have been derived from the Weekly Return of the strength from April 1855 to May 1856 (inclusive), and for the previous period, April 1854, to March 1855 (inclusive), from the Return (A.) of the deaths during each month, and from a Return of the Rate of Mortality during the same periods.

Class of Diseases.	Number of Deaths from specified Causes.	Of the Total Deaths, the proportion per cent. from each Class.	Of the Total Deaths, (exclusive of violent Deaths), the proportion per cent. from each Class.	Deaths Annually, to 100 Living.
1 Zymotic -	14,507	81·9	94·3	18·7
2 Constitutional -	204	1·1	1·3	·3
3 Local -	668	3·8	4·3	·9
4 Developmental -	19	·1	·1	—
5 Violent -	2,314	13·1	—	3·0

TABLE H.—b.

ANNUAL RATE of MORTALITY per Cent., from different Classes of Disease, in Hospital in the Army of the East, and in the English Male Population of the Ages 15-45.

Class of Diseases.	Deaths annually, to 100 living.	
	In the Army of the East.	English Male Population, 15-45 (1848-54).
1 Zymotic Diseases -	18·7	·20
2 Constitutional Diseases -	·3	·42
3 Local Diseases -	·9	·26
4 Developmental Diseases -	—	—
5 Violent Deaths -	3·0	·10
All Causes -	22·9	·98

TABLE K.—Figure 1.

TABLE SHOWING the ESTIMATED AVERAGE MONTHLY STRENGTH of the ARMY; and the Deaths and Annual Rate of Mortality per 1,000, in each Month, from April 1854 to March 1856, (inclusive), in the Hospitals of the Army in the East.

Months.	Estimated Average Monthly Strength of the Army.	Deaths.			Annual Rate of Mortality per 1,000.		
		Zymotic Diseases.	Wounds and Injuries.	All other Causes.	Zymotic Diseases.	Wounds and Injuries.	All other Causes.
1854							
April -	8,571	1	—	5	1·4	—	7·0
May -	23,333	12	—	9	6·2	—	4·6
June -	28,333	11	—	6	4·7	—	2·5
July -	28,722	359	—	23	150·0	—	9·6

Handwritten text in a large rectangular box at the bottom of the page, mostly illegible due to fading.

DIAGRAM representing the relative Mortality of Males of the Soldiers Ages living in Healthy Districts and of the Non Commissioned Officers and Men serving in the Army abroad and at home exclusive of Artillery Royal Engineers West India and Colonial Corps 1839 - 1853

MAGR.A.M. - representing the relative Mortality of Males of the Soldiers Ages living in England and Wales, and of the Non-Commissioned Officers and Men serving in the Army exclusive of Artillery, Royal Engineers, West India and Colonial Corps 1839-1853.

DIAGRAM

Showing the Numbers Living and Dead at the Several Ages from 20-40.

1. ENGLISH SOLDIERS.

2. ENGLISHMEN.

3. ENGLISHMEN IN HEALTHY DISTRICTS.

Thus:- the Diagram (1) shows that out of 10,000 Soldiers alive at the Age of 20, about 7000 are living and 3000 are dead at the Age 40.

24 JUN 1929

I. DIAGRAM — representing the ARMY at Home in its present State.

I. This Diagram has been constructed to illustrate Table F.a.

II. DIAGRAM — representing the ARMY at Home in an improved State.

II. This Diagram is constructed so as to show what the State of the Army at Home would be if the Mortality were the same as it is in the Civil Population at corresponding Ages, and if the Invaliding bore the same proportion to the Deaths as it does in Diagram I. The Invaliding may be more, but it would probably be less than it is represented to be in Diagram II.

TWO DIAGRAMS showing the loss of strength in the ARMY by INVALIDING and by DEATH.

The force 141,764 (represented by the RED Area,) is assumed to be maintained by 10,000 Annual Recruits, which if there were no loss by Death, or by Invaliding would sustain a force of 200,000 Men, represented by the Square figures. — The loss of strength shown in Diagram I is equal to 58,237 = 29 per Cent. The DARK Yellow Area represents the loss of strength by DEATH.

The YELLOW Area represents the loss of strength by INVALIDING, and it will be borne in mind that many of the Invalided die soon after leaving the Army.

NOTE. 10,000 Annual Recruits under System No I, would sustain a force of 141,764; under System No 2, 10,000 Annual Recruits would sustain a force of 166,910. (See Table F.d.)

Owing to Service abroad in unhealthy Stations, the numbers are actually reduced much more rapidly than they are at home, as shown in Diagram I.

24 JUN 1929

representing the relative burden imposed upon ALL CAUSES, ZYMOTIC DISEASES, CHEST and TUBERCULAR DISEASES and OTHER DISEASES in the ENGLISH MALE POPULATION aged 15 to 45 and in the INFANTRY of the LINE serving at home

ENGLISH MALE POPULATION AGED 15 45 (1848 51)

Zymotic Diseases 2 0 to 1000 living	Chest and Tubercular Diseases 4 3 to 1000 living	All other Diseases 3 3 to 4000 living
Deaths Annually to 1000 living from All Causes 6 8		

(This table parallelogram represents the additional area which would be occupied by the mortality among the ENGLISH MALE POPULATION if they were as unhealthy as the INFANTRY OF THE LINE at home.)

INFANTRY OF THE LINE (SERVING AT HOME) (1857 46)

Zymotic Diseases 4 1 to 1000 living	Chest and Tubercular Diseases 10 1 to 1000 living	All other Diseases 3 7 to 1000 living
Deaths Annually to 1000 living from All Causes 17 9		

LINES

Representing the Relative Mortality, from different Causes, of the **Army in the East in Hospital** and of the **English Male Population** aged 15—45.

All the Lines on this Diagram would require to be lengthened TENFOLD to be on the same Scale as the Lines on Diagrams A and B.

(K) DIAGRAMS

representing the relative Mortality from ZYMOTIC DISEASES (blue), from WOUNDS &c (red), and from ALL OTHER CAUSES (black).

IN THE HOSPITALS OF THE ARMY IN THE EAST,
FOR EACH MONTH FROM APRIL 1854 TO MARCH 1856

APRIL 1855 TO MARCH 1856

APRIL 1854 TO MARCH 1855

DIAGRAM

showing the Average Rate of Mortality Per Cent. on the
SICK POPULATION AT SCUTARI,
FROM OCTOBER 1st 1854 TO JUNE 30th 1855

Fig 2.

Had Fig 1 been projected on the same Scale as the other Figures in this Sheet the longest Radius showing the Mortality in February would have projected 4 inches from the Centre of the Circle

ARMY IN THE EAST.

APRIL 1855 TO MARCH 1856

APRIL 1854 TO MARCH 1855

**EXPLANATION.**

The Diagrams represent the ANNUAL RATE of Mortality per 1000 in the Hospitals of the Army in the East for each Month from April 1854 to March 1855.

The inner circle shows the Mortality which the Army would have experienced if it had been subject to the same rate which prevailed in one of the unhealthiest Cities of England (Manchester). The distances between the Centre and the second, the second and the third circles &c. each represent 100 deaths to 1000 living. The Annual rate of Mortality in any particular Month is shown by the length of the radial line extending from the centre in the direction of the Month indicated on the outer circle.

Thus in January 1855 the Annual rate of Mortality per 1000 was 171, a higher rate than that which prevailed during the Month (September) when the Mortality was highest in the year of the Great Plague, 1665.

"	"	15 Dec./51	- 20 Dec./51	- 6	Venereal -	P. 56 days from 22 Sept./52.
"	"	17 Jan./52	- 20 Jan./52	- 4	Diarrhoea -	P. 112 days from 1 July/53.
"	"	17 Dec./53	- 19 Dec./53	- 3	Diarrhoea -	P. 30 days from 9 Feb./54.
3	7	15 Aug/57	- 17 Aug/57	- 3	Ulcus penis, n.s.	

No. 5268.—WILLIAM JOHNSON, enlisted 18th October 1847, at London, in the County of Middlesex, aged 18 $\frac{2}{3}$ Years ; Trade, Labourer.

No. of		Dates of		Days in Hos- pital.	Disease.	Promotions, Reductions, Remarks, &c.
Batt.	Co.	Admission.	Discharge.			
2	1	30 May/50	- 31 May/50	- 2	Fever, C. C. -	From Drill.
"	"	26 Feb./53	- 28 Feb./53	- 3	Swelled face -	P. 111 days from 7 Nov./49.
"	"	19 Aug./53	- 26 Aug./53	- 8	Colic -	P. 40 days from 16 Apl./50.
"	"	20 Sept./53	- 22 Sept./53	- 3	Diarrhoea -	Prisoner.

Deserted 11th March 1851.
Rejoined 24th Feb. 1853.
P. 168 days from 3 Mar./53.
P. 168 days from 15 Oct./53.

31 March 1854, discharged for bad conduct.

APPENDIX LXXV.

FORM of SANITARY REPORT sent annually to the War Office from all Foreign Stations where Troops are serving.

No. I.—SANITARY REPORT.

To the
Officer Commanding
the

of

SIR,—I have the honour to forward, for the information of the Right Honourable the Secretary-at-War, the following Sanitary Report of the Troops under my superintendence at the Station of
for the year from 1st April 18 , to the 31st of March 18 .

[In case the Medical Officer is removed from the Station before the termination of the period when his Report should be completed, he will make it up to the day of his departure, and leave it with his successor, who will be held responsible on taking over charge that this has been attended to.]

By a Return hereto annexed, A, with which you have furnished me, the average strength of these Troops, and the Deaths from all causes among them during the above periods have been as under :—

	WHITE TROOPS.					Com- missioned Officers, including Staff.	BLACK TROOPS.				
	Serjts.	Corpls.	Drmrs.	Privts.	Total.		Serjts.	Corpls.	Drmrs.	Privts.	Total.
Average strength											
Total Deaths, both in and out of Hospital - }											

In these Deaths are included the following, which took place out of Hospital :—

						WHITE TROOPS.		BLK. TROOPS.
						Non-Commis- sioned Officers and Privates.	Commissioned Officers. only.	Non-Commis- sioned Officers and Privates.
Here state any other cause of Sudden Death.*	Killed in Action	-	-	-	-			
	Drowned	-	-	-	-			
	Murdered	-	-	-	-			
	Suicide	-	-	-	-			
	Rupture of Blood Vessel	-	-	-	-			
	Found Dead, cause unknown	-	-	-	-			
	Sudden Deaths from Apoplexy	-	-	-	-			
	” ” Coup de Soleil	-	-	-	-			
Total Deaths out of Hospital						-	-	
Remain to be accounted for, who Died under Hospital Treatment						-	-	

[The Commissioned Officers of Black Corps, being Europeans, will always be included under the head of White Troops.]

* [The Deaths of Men on Furlough, and Officers on leave, if occurring within the limits of the Command, will also be here stated, and the cause of death specified, if known.]

The Diseases by which these Deaths, as well as the whole admissions into Hospital in the course of the year, have been occasioned, are specifically detailed in Returns hereto annexed, B and C, whereof the following is an Abstract :—

	WHITE TROOPS.				BLACK TROOPS.	
	Non-Commissioned Officers and Privates.		Commissioned Officers.		Non-commissioned Officers and Privates.	
	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.
Fevers - - - - -						
Eruptive Fevers - - - - -						
Diseases of the Lungs - - - - -						
" Liver - - - - -						
" Stomach and Bowels - - - - -						
Epidemic Cholera - - - - -						
Diseases of the Brain - - - - -						
Dropsies - - - - -						
Rheumatic Affections - - - - -						
Venereal Affections - - - - -						
Abscesses and Ulcers - - - - -						
Wounds and Injuries - - - - -						
Corporal Punishment - - - - -						
Diseases of the Eyes - - - - -						
" Skin - - - - -						
Other Diseases - - - - -						
Total - - - - -						

[In this portion of the Return the Medical Officer will be particularly careful that the diseases of White and Black Troops are kept distinct ; also that no diseases of Women or Children are included, or of Sailors landed from any of Her Majesty's Ships in a state of Sickness, or of Invalids who may touch at the Station not belonging to any of the Regiments serving in the Command.]

[Deaths which take place among Men left in Hospital by Corps on quitting the Island or Command may, however, be included.]

The Number daily Sick in Hospital at this Station during the past Year has been carefully registered by me, and the average amounts to _____ of the White Troops, and _____ of the Black Troops, as per States annexed, D and E.

Having thus detailed the extent of Mortality and Sickness, I shall next proceed to state how far these may probably have been influenced by the following agencies :—

1.—DUTY AND EMPLOYMENT.

[Referring to the detail of duties furnished to him by the Officer Commanding, in Return A, hereto annexed, the Medical Officer will state whether the extent or nature of these is likely to have proved injurious to the Troops ; whether he conceives the night duties too severe for the strength of the Garrison ; whether the parades and drills of the White Troops take place at the hours least likely to expose them to solar influence ; whether they are often employed on fatigue or working parties ; and any other particulars under this head by which he conceives their health may probably have been deteriorated.]

2.—BARRACK AND HOSPITAL ACCOMMODATION.

[The Medical Officer will here describe the Barrack and Hospital occupied by the Troops under his superintendence, specifying the number of Rooms or Wards, the dimensions of each, and the average number of Men quartered therein ; also, whether, taking into consideration the nature of the Climate, he deems this accommodation sufficiently ample. He will state whether the buildings are properly ventilated ; and if any remarks are necessary as to the Barrack and Hospital Bedding, he will also enter into these details. He will state what provision is made to ensure the personal cleanliness of the Troops, particularly if they are provided with washing troughs, and a proper supply of water for that purpose. He will mention whether the Guard Houses are sufficiently capacious, and if repairs have become necessary in any of the buildings to protect the health of the Troops, he will state whether this has been immediately represented to the proper authorities, and if the repairs have not forthwith been executed, he will annex a copy of his representation with the reasons assigned for the delay.

[If there are any Outposts of which the sick come under his superintendence, he will furnish similar particulars in regard to the Barrack accommodation there.]

3.—DIET.

[Under this head he will state how the Soldiers' meals are regulated, and of what they generally consist ; whether they are plentiful and nourishing, and afford the best variety which the productions of the country, and the rate of pay will admit. He will particularly advert to any alterations which may have recently been introduced in rationing or dieting the Troops, and state his opinion as to the influence they have had on their health. He will state if the Water supplied to the Soldiers for drinking is of a good quality, and whether it requires filtration or any other process before being fit for their use.]

4.—CRIME AND PUNISHMENT.

[Referring to the detail of Courts-martial, Crimes and Punishments among the Troops at this Station, furnished him by the Officer Commanding, in Return A, hereto annexed, he will state his opinion how far the admissions into Hospital have been increased by the frequency and nature of the punishments which have thus become necessary ; whether any of the Men have been long incapacitated from their duty by Corporal Punishment, or if it has in any instances induced diseases of a serious nature. If any have died of those admitted into Hospital in consequence of Corporal Punishment, he will annex to his Report a full and explicit detail of the case. He will state whether the cells for the Prisoners are in good repair, and if any of the modes of punishment resorted to at the Station appear to operate prejudicially to the health of the Troops.]

5.—INTEMPERANCE.

[The prevalence of this vice among the Troops being a generally alleged cause of disease, and always a fertile source of crime and punishment, will here be specially referred to. He will state whether many of the cases admitted into Hospital have been obviously the result of intemperance ; also what facilities the Station affords for this indulgence, and how these may be best obviated. Adverting particularly to the amount of surplus Pay at the disposal of the Soldier, as shown in Return A, hereto annexed, and the quantity of liquor which that will purchase at the Station, he will state whether a reduction of that surplus Pay by increasing the expenditure for Messing, would be an advisable means for improving the health and conduct of the Troops.]

GENERAL REMARKS.

[He will here state any circumstances not included under the preceding heads which he conceives likely to have affected the health of the Troops during the past year, and offer any suggestions as to the best means of obviating them, and reducing the Sickness and Mortality in future.]

NOTE.—In filling up this Return the Medical Officer will be careful not to enter into any particulars regarding the symptoms treatment, or medical history of any of the cases, which it is his duty to detail in his Report to the Director General of the Army Medical Department ; the object of this Report being merely to ascertain the extent of the Mortality and Sickness, the diseases most inimical to the constitution of the Troops, and such causes of those diseases as it may be practicable for the Secretary-at-War to remove.

(Signed)
Surgeon, or Assistant Surgeon.

A.

RETURN of the Strength and Deaths among the Troops serving at the Station of
with a detail of the duty performed, application of the Soldier's
Pay, and extent of Crimes and Punishments during the Year, from 1st April 18 to 31st
March 18 .

1. The Strength of the Troops under my Command at this Station, including Outposts and Detachments to which no separate Medical Officer is attached, has been, during the past year, a
under:—

	WHITE TROOPS.						BLACK TROOPS.				
	Serjts.	Corpls.	Drmr.	Privts.	Total.	Officers.	Serjts.	Corpls.	Drmr.	Privts.	Total.
1st April -											
1st May -											
1st June -											
1st July -											
1st August -											
1st September -											
1st October -											
1st November -											
1st December -											
1st January -											
1st February -											
1st March -											
Totals -											
Average -											

[To The Officer Commanding at the Station of
SIR,—You are requested to state, for the information of the Secretary-at-War, the particulars specified in the annexed Return, and to forward the same to the Medical Officer in charge of the Troops under your command, for the purpose of enabling him to make up his Annual Sanitary Report.

I have the honour to be,
Your most obedient humble Servant,
(Signed) B. HAWES.]

[The Strength of such Detachments from this Station as have a Medical Officer in charge of them do not require to be included here, as they will be stated in a separate Sanitary Report by that Officer, accompanied by a Return from the Officer in Command of the Detachment.]

2. Of the above strength, the Casualties which have occurred by death at this Station during the above period have been—

					Serjts.	Corpls.	Drmrs.	Privts.	Total.	Officers, including Staff.
Of White Troops	-	-	-	-						
Of Black Troops	-	-	-	-						

3. The daily detail of duty generally performed by the Troops at this Station has been as under :—

	WHITE TROOPS.							BLACK TROOPS.					
	Serjts.	Corpls.	Drmrs.	Privts.	Sentries.		Officers.	Serjts.	Corpls.	Drmrs.	Privts.	Sentries.	
					By Day.	By Night.						By Day.	By Night.

Do. at - -													
Do. at - -													
Picket at - -													
Do. at - -													
Working } -													
Party at } -													
Total on } Duty }													

4. The Weekly Surplus of Pay available to each rank for personal expenditure at this Station may be taken at the following average, exclusive of additional allowances for Good Conduct or Length of Service :—

	WHITE TROOPS.								BLACK TROOPS.							
	Serjts.		Corpls.		Drmrs.		Privts.		Serjts.		Corpls.		Drmrs.		Privts.	
Stoppage for Messing -	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.	s.	d.
Do. for Washing -																
Do. for Necessaries*																
Other Stoppages - -																
Total Deductions from Pay																
Pay of each Rank—																
Less Stoppage for Ration }																
Remains for Personal Ex- }																
penditure - - - }																

* [The Stoppages or Necessaries will of course vary materially in individual instances, but the average can easily be found by the Officers in charge of Companies dividing the total stoppages for Necessaries annually by the number of Men in each Company.
[If the Troops are not paid in British Currency, the Commanding Officer will state at what rate the Soldier's Pay is converted into the coin of the Country, and whether that corresponds in intrinsic value to the British Currency it is intended to represent.

5. The number of Soldiers convicted by Courts-martial at this Station during the past year, with the nature of their Crimes and Sentences, have been as follows :—

WHITE TROOPS.—Sentences.											BLACK TROOPS.—Sentences.										
Crimes.	Death.	Transportation.	To be reduced to the Ranks.	Corporal Punishment.	Loss of Pension.	To be discharged with Ignominy.	Forfeiture of Pay or Beer Money.	Solitary Confinement.	Imprisonment with or without Hard Labour.	Total.	Death.	Transportation.	To be reduced to the Ranks.	Corporal Punishment.	Loss of Pension.	To be discharged with Ignominy.	Forfeiture of Pay or Beer Money.	Solitary Confinement.	Imprisonment with or without Hard Labour.	Total.	
Mutiny - - - -																					
Desertion - - -																					
Violence to a Superior, and Insubordination - -																					
Disobedience - - -

STATE of the Daily Sick in Hospital of the Black Troops serving at the Station of from 1st April 18 to 31st March 18 .
(This State is precisely similar in form to that for the White Troops.)

No. II.—GENERAL SANITARY REPORT.

To the General Officer
 Commanding the Troops
 in the

of

SIR,—I have the honour to forward, for the information of the Right Honourable the Secretary-at-War, the accompanying Sanitary Reports of the Troops of the different Military Stations in this during the Year, from the 1st April 18 to the 31st March 18 , of which the following is an Abstract.

[In transmitting these Reports, the Principal Medical Officer will be careful that they are in every respect complete, accurately filled up, and that any documents therein referred to accompany them.]

From these Reports, as well as from a Return hereto annexed, A, furnished to me by the average strength of these Troops, and the Deaths from all causes among them during the above period have been as under :—

—	WHITE TROOPS.					Officers, including Staff.	BLACK TROOPS.				
	Serjts.	Corpls.	Drmrs.	Privts.	Total.		Serjts.	Corpls.	Drmrs.	Privts.	Total.
Average Strength											
Total Deaths, both in and out of Hospital }											

[Black Pioneers to be included under the head of Black Troops.]

In these Deaths are included the following, which took place out of Hospital:—

—							WHITE TROOPS.		BK. TROOPS.
							Non-Commis- sioned Officers and Privates.	Commissioned Officers only.	Non-Commis- sioned Officers and Privates.
Here state any other cause of Sudden Death.*	Killed in Action	-	-	-	-	-			
	Drowned	-	-	-	-	-			
	Murdered	-	-	-	-	-			
	Suicide	-	-	-	-	-			
	Accident	-	-	-	-	-			
	Ruptured Blood Vessel	-	-	-	-	-			
	Found Dead, cause unknown	-	-	-	-	-			
	Sudden Deaths from Apoplexy	-	-	-	-	-			
	” ” Coup de Soleil	-	-	-	-	-			
Total Deaths out of Hospital							-	-	-
Remain to be accounted for, who Died under Hospital Treatment							-	-	-

[The Commissioned Officers of Black Corps, being Europeans, will always be included under the head of White Troops.]

* [This portion of the Report, as well as that on the following page which specifies the classes of Diseases, consists merely of the Totals reported by each of the subordinate Medical Officers under the same heads.]

The Diseases by which these Deaths, as well as the whole admissions into Hospital have been occasioned throughout this in the course of the past year, are specifically detailed in the Returns hereto annexed, B and C, from which the following state has been compiled to exhibit the results in a more comprehensive form :—

	WHITE TROOPS.				BLACK TROOPS.	
	Non-Commissioned Officers and Privates.		Commissioned Officers.		Non-Commissioned Officers and Privates.	
	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.
Fevers - - - - -						
Eruptive Fevers - - - - -						
Diseases of the Lungs - - - - -						
„ Liver - - - - -						
„ Stomach and Bowels - - - - -						
Epidemic Cholera - - - - -						
Diseases of the Brain - - - - -						
Dropsies - - - - -						
Rheumatic Affections - - - - -						
Venereal Affections - - - - -						
Abscesses and Ulcers - - - - -						
Wounds and Injuries - - - - -						
Corporal Punishment - - - - -						
Diseases of the Eyes - - - - -						
„ Skin - - - - -						
Other Diseases - - - - -						
Total - - - - -						

Of these Admissions and Deaths, the number which took place at each of the subordinate Military Stations, as well as the mean daily sick there, are stated in the Reports of the several Medical Officers to have been as follows :—

STATION.	WHITE TROOPS.					BLACK TROOPS.		
	Non-Commissioned Officers and Privates.			Commissioned Officers.		Non-Commissioned Officers and Privates.		
	Admitted.	Died.	Daily Sick.	Admitted.	Died.	Admitted.	Died.	Daily Sick
Total - - - - -								

[Nothing more is necessary here than to insert the total Admissions, Deaths, and average Daily Sick in each of the Reports, prefixing the name of the Station.]

The following State will show the composition of the whole force of White Troops classed according to the periods they have been stationed in as well as the relative number of admissions and deaths in each Class, for the purpose of determining whether their liability to sickness or mortality is lessened by length of residence :—

Period of Residence.	Strength of each Class.	Admissions of each Class.	Deaths of each Class.
Under One Year - -			
1 to 2 Years - - -			
2 to 3 Years - - -			
3 to 4 Years - - -			
4 to 5 Years - - -			
5 to 6 Years - - -			
6 to 7 Years - - -			
Above 7 Years - -			

[The Regimental Surgeon at the Head Quarters of each Corps will, by keeping a Register of the number of each Class in the Regiment, and also how many of that Class are treated or die in the course of the Year, both at Head Quarters and on Detachments, be able to furnish the Principal Medical Officer with materials, by combining which, the requisite information will be obtained for the whole force, and the Principal Medical Officer will give instructions accordingly.]

The influence of the seasons in producing sickness and mortality among the whole force of White Troops in this is shown as follows:—

	Fevers.		Diseases of the Lungs.		Diseases of the Liver.		Diseases of the Stomach and Bowels.		Diseases of the Brain.		All other Diseases.		Total.	
	Adm.	Died.	Adm.	Died.	Adm.	Died.	Adm.	Died.	Adm.	Died.	Adm.	Died.	Adm.	Died.

February - - -								
March - - -								

[If these Instruments are not available at the Station, he will state that as his reason for leaving this part of the Report blank.]

The number of Troops invalided, or Officers who have obtained Sick Leave from this during the past year have been—

	Serjeants.	Corporals.	Drummers.	Privates.	Officers.
Of White Troops -					
Of Black Troops -					

I have annexed Returns D and E, specifying the Disease of each Invalid, the period he has resided in the , how long he has been under treatment, and such other particulars as may serve to illustrate his case.

Having thus stated the extent of the mortality, sickness, and invaliding during the past year among the Troops in this , I shall now proceed to notice the causes referred to in the accompanying Medical Reports from the different Stations as likely to have influenced the health of the Troops there.

ALLEGED CAUSES OF SICKNESS AND MORTALITY.

[Here the Principal Medical Officer will refer to any causes which may be stated in the Reports of his subordinate Officers to have affected the health of the Troops, and will be particular in specifying whether they are in accordance with his own observations and experience. If no such remarks occur it will be unnecessary for him to enter into further details, except to offer any suggestions which may occur to him as calculated to improve the health of the Troops in future.]

(Signed)

Principal Medical Officer.

A.

RETURN showing the average Strength of the Troops serving in _____, with the
Number who died or were invalided of that Force, from 1st April 18__ to 31st March 18__ .
The Strength of the Troops employed, as shown by the Monthly Musters, has been during the
period as follows :—

—	WHITE TROOPS.						BLACK TROOPS.				
	Serjts.	Corpls.	Drmrs.	Privts.	Total.	Comd. Officers.	Serjts.	Corpls.	Drmrs.	Privts.	Total.

Principal Medical Officer.

[This Return comprises merely the Totals reported by the subordinate Medical Officers under each of these Diseases.]

C.

RETURN showing the Specific Diseases by which the Admissions into Hospital and Deaths have been occasioned among the Black Troops serving at from 1st April 18 to 31st March 18 , arranged according to the following Classes :—
 (This Return is precisely similar in form to that of the White Troops, and it is, therefore, not printed here in full.)

D.

RETURN of Non-Commissioned Officers and Privates invalided, and Officers who have obtained Sick Leave, of the White Troops, serving in the of from 1st April 18 to 31st March 18 .

Corps.	Rank.	Name.	Period of Residence in the Command.	Disease for which Invalided or obtained Sick Leave.	Period under Treatment.	Whether probable Result of this Climate, or of a previous Course of Service elsewhere.	If an Officer, to what Place and for what Period has he gone on Sick Leave.

(Signed)

Principal Medical Officer.

[Officers belonging to the Black Regiments will also be included here.]

E.

RETURN of Non-Commissioned Officers and Privates who have been Invalided or Discharged, of the Black Troops, serving in the of from 1st April 18 to 31st March 18 .

Corps.	Rank.	Name.	Total Length of Service in the Army.	Disease for which he was Discharged or Invalided.	Period under Treatment.	If Discharged, state whether with or without Pension, and the Amount.

(Signed)

Principal Medical Officer.

APPENDIX LXXVI.

ABSTRACT OF INSTRUCTIONS to ADMINISTRATIVE OFFICERS in the FRENCH MILITARY HOSPITALS.

GENERAL DUTIES and QUALITIES.

Of the Hospitaliers.

Duties. Their general duties may be summed up,—in the exertion of their moral and physical faculties in promoting the welfare of the invalids by means of kindness, and attention to their wants, order and regularity in the administration, civility and firmness towards the *infirmiers*, whom they must guide and superintend in the fulfilment of their duties, and in respectful attention to the directions of the medical officers. They must therefore be endowed with honesty, courage, abnegation, sufficient education, ingenuity, and energy of body and mind, in order to take proper measures for the good of the service in case of emergency.

Qualifications.

Officier d'Administration on Duty.

The service of an *officier d'administration* on duty begins at five in the morning in summer, and at day-break when the days are shorter.

It ends at the same hour the next morning.

During that time he cannot leave the hospital or retire to rest.

Rounds of inspection. He has to accompany officers or other persons charged with the duty of inspecting hospitals, and to take note of their questions or remarks. He must make frequent rounds of inspection during day and night at irregular intervals; in short, exercise the utmost vigilance that the service is carried on in every part of the establishment with the greatest order and regularity. He must be informed of everything that has been done, is being done, or is to be done, in order that he may be prepared to give an account of everything in case of an inspection by the authorities.

When not engaged on his rounds of inspection he must sit in his office, where the report book must be always ready to be consulted at any moment.

Must be informed of all that is going on. On delivering over charge to his successor on duty he shall inform him both in his written and verbal report of that which has been done, or is in progress of completion, that the latter may duly proceed with the same.

Must sit in his office when not on his rounds. The *infirmiers majors* and *infirmiers* must bring to the *officier d'administration* on duty all their reports and requisitions, and they shall receive from or through him all orders for the service, so that he will be thus constantly informed of what is going on.

Report to relieving officer d'administration. In him is vested the power of inflicting the punishments that the *infirmiers* may deserve during the time he is on duty, being free to consult on the subject with the director or the 1st class adjutant, in cases of doubt or hesitation.

All reports to be made to the officer d'administration. He shall go on his round of inspection at the time of the visits, the dressing of the wounds, and the distributions of food and medicine, to see that everything is properly prepared and proceeds in perfect order, and that no abuse or neglect occurs anyhow or anywhere.

Invested with powers to punish infirmiers. And among the principal objects for his vigilance are, that all the linen having served for dressings be collected; that this and all other dirty linen be returned to their respective stores and dépôts; that the delivery of the clean linen be made with due care; that the ptisans, rations, and medicines be properly prepared and delivered, regard being had also to their quality, quantity, time and mode of administration; that the *infirmiers majors* and *infirmiers* evince the utmost exactitude in the discharge of all their duties, at the visits, dressings, distributions, works of cleanliness, &c., &c.; that they carefully tend the patients in their beds, baths, &c., &c.; at their night watch, helping and relieving each other at the proper time; that they are regular in re-entering the hospital at the appointed times, the whole as detailed in the instructions for the *infirmiers majors* and *infirmiers* with

which each *officier d'administration* must be thoroughly conversant.

He must also constantly watch and ascertain that all the materials, such as the linen, utensils, furniture, provisions, lights, fuel, stoves, &c., are kept in proper condition and preservation, and used in the proper manner, and with the wisest economy, revising frequently all the lists, and controlling all the supplies.

He must enforce the strictest order in every part of the establishment, and exact from the patients, *infirmiers majors* and *infirmiers*, visitors, &c., &c., the strictest conformity to the rules laid down for each class respectively.

Each day before sunset he will cause the *infirmier major* on duty, or all the others separately, to give him an account of all the most serious cases in each ward, with an exact specification of their respective numbers, &c., and particularly of the prescriptions, in order that he may ascertain whether they have been precisely followed in each case.

Every morning the *officier d'administration* before delivering over charge to his successor relieving him, will make his report, containing a brief and clear abstract of the reports made during the time of his service,—

By the visiting officer.

„ the *infirmier major* on duty.

„ the porter.

„ the non-commissioned officer on guard.

INSTRUCTIONS for the ADMISSION OFFICE. (BUREAU DES ENTRÉES.)

Chapter 1st.

Necessity of the greatest Exactness in the Entries of the admitted Patients.

It is extremely important that no error or omission take place in entering the names, and all the particulars of the patients admitted, for the least inexactitude, however apparently of little consequence, may produce very serious results. In fact, if the time of admission, or the number of the company, troop, battalion, regiment, or arm, are not clearly indicated at the time of his discharge, a soldier may be sent to a wrong, and sometimes very distant place, and so, besides creating confusion, the soldier is exposed to the danger of being arrested and punished as a deserter; and the government to needless travelling expenses. Also, if his passage from place to place, or from one hospital to another, be not exactly described, the man may suffer great loss both in money and character.

Not less important is it that the dates, and the christian and surname be written out in full, as well as the place of birth, parish, district, province, &c., &c., in the event of its proving necessary to make any communication on matters of property, marriage, or succession, either to the parish authorities or the family of the soldier.

The importance of being exact in making out a list of all the effects belonging to any patient admitted, and the right denomination of the complaint for which he is admitted, is too obvious to require further notice.

Chapter 2d.

Requisite Formalities on the Admission of Patients.

From what was said in the preceding chapter, the *officier d'administration* must be very cautious, in receiving a ticket of admission, to see that it is regular and authentic.

Tickets of admission must be always delivered by the head surgeon, signed by the captain, registered by the treasurer or paymaster, and viséd by the sous-

Good and service materials.

Admission to the service order.

Commissary's report.

Exactness in the mission.

Importance of having all particulars minutely stated.

Formalities for admission.

intendant militaire. Sometimes all these formalities cannot be fulfilled, and then the signature of the chief officer in service, and that of the *sous-intendant militaire* will suffice.

Soldiers travelling alone must be furnished with an admission ticket, signed by the commandant of the place, or a staff officer, and viséd by the *sous-intendant militaire*. The *officier d'administration* at the head of the admission office, must verify the signatures of the tickets, particularly when the applicants do not belong to the garrison, to guard against forgery; and in case of doubt he must refer to the director.

If a wounded or sick military man presents himself without his ticket, in a state declared by the medical officer on guard not to allow of his removal either to his corps or to the office of the *sous-intendant militaire*, a ticket of urgency may be granted to him, in order that he may receive immediate assistance, provided it be ascertained that he is a soldier, and to what corps or branch of the service he belongs.

If he is on the strength of the garrison, a ticket must be claimed from the corps to which he belongs; otherwise, from the *sous-intendant militaire*, to whom also are sent, all the papers and the provisional ticket, that he may complete its validity by his signature, after he has verified the signature of the medical officer testifying to the urgency of the immediate admission of the patient.

Whenever a soldier is brought in wounded, or dangerously ill, it is of the greatest importance to ascertain the most minute particulars respecting the individual, as well as the circumstances relating to the wound, and also the names of the parties accompanying him, to be furnished for the guidance of justice, in case of a legal investigation taking place.

If the wounded or sick man is found to be a civilian, the medical officer on duty will be requested to afford him the most urgent relief, and then to remove him to the nearest civil hospital.

The admission-ticket must show, besides the christian and surname of the invalid, his rank or employment, the number of the register-book, and of the annual control book; the numbers of the company, battalion, or squadron, and of the regiment to which he belongs (his nation, if a prisoner of war), the date and place of his birth, parish, district, and province; the names and residence of his parents, his personal description, particular marks, &c., &c.; and his place of destination after his recovery. The ticket must declare also, whether he is on leave, disbanded, or on pension; in the latter case, the amount of pension he receives, and where he receives it.

Officers on half-pay can be admitted into military hospitals only in case they have to undergo some great surgical operation, or when labouring under serious infirmities resulting from the fatigues of war. For these, the signature of the *sous-intendant militaire* is necessary, previous to their admission.

The same rule applies to all pensioners.

The dates upon the tickets of admission must be written out in full, and in case of any mistake, they must be rectified and initialed, either by the *officier d'administration* or by the *sous-intendant militaire*, as the case may require. All the dates must be entered in a book.

Tickets of admission on transfer must convey all the necessary particulars, and if many men are transferred at the same time from one hospital to another, a general list, with all the relative particulars, may be drawn up, from which the new admission tickets are made out.

Should particulars be wanted the director of the hospital shall procure them from the director of the other hospital or from the corps.

Chapter 3d.

Precautions to be taken on the Reception of the Patients and their Distribution into the Wards.

On an invalid presenting himself for admission into the hospital, the surgeon on duty shall question him

at once, in order to ascertain the nature of his disease, and the ward to which he ought to be assigned. and pre-cautions.

When his admission is approved by the medical officer the *officier d'administration* having directed him to a comfortable seat, must carefully examine the ticket he bears, cross examining him upon all the particulars requisite to make him certain of the identity of the individual.

Should the invalid be unable to answer, or if any doubt should arise from his answers or other circumstances, he will cause him to produce his pocket book or other papers of a nature to remove such doubts, and if any remain still, he shall report the same to the director.

From the particulars contained in the ticket or list brought from the corps, or from another hospital, a new ticket of admission is drawn up with all the most minute particulars as directed in the preceding chapter. A duplicate or copy is then made out which is called the ticket of issue, because it is delivered to the patient on his going out of the hospital, either cured or transferred to another hospital.

On both these tickets an exact inventory must be inscribed of the effects and arms, as well as of any objects of value that he may have on him, and which he will be requested to deposit. Every object and kind of coin must be specified and described on the tickets, and a receipt for them at the bottom must be signed by the *officier d'administration* in order that on his going out there may not be any dispute on the subject. If the patient insists upon denying having anything to deposit, it must be added at the foot of the description of the effects, that he declares that he has nothing to deposit. He marks then on the *tableau* ⁽¹⁾ of the ward specially appointed for the treatment of the disease in question, the number where the patient is to be placed, inscribes it also at the top of the tickets of admission and of ward after the No. of the Ward, and inserts a label ⁽¹⁾ bearing the name of the man in the place corresponding to that he is to occupy.

Having fulfilled these formalities, a number is given to the invalid, which shows the place occupied by his effects, and which is added to his duplicate or issue ticket, and also to his ward ticket, then he is conducted to the dressing-room, where in exchange for his clothes he receives a shirt, a cap (woollen in winter), a pair of socks, a pair of slippers, trowsers, and a gown.

His own clothes are tied up in a bundle in his presence, and the number he bears attached thereto.

Before making up the bundle all dirty clothes must be separated to be washed.

In some hospitals when the medical officer's office is distant from that of the *officier d'administration*, the patient is examined by him after the other formalities have been fulfilled, but the other course is preferable.

As soon as he is installed in his bed the *infirmier* under whose care he is placed, makes a detailed report of all the particulars, and delivers to the dress stores a suit of hospital effects similar to that worn by the newly-admitted patient, out of the suits that he has always in reserve.

If there are several patients admitted at the same time the same formalities are gone through for each separately, giving precedence to those more seriously ill. Patients in a very grave state must be taken immediately to their beds, and the necessary formalities fulfilled afterwards.

The utmost despatch is to be recommended to the *officiers d'administration* in all these formalities in order to abridge the sufferings of the patients requiring rest and relief.

Chapter 4th.

Book-keeping.

The *officier d'administration* charged with the registers, must be careful that every entry is kept in the most regular and complete order, without arrears of a single day or omissions of any kind.

⁽¹⁾ The tableau and labels will be described hereafter.

Duplicate of admission ticket or issue ticket.

Inventory of objects deposited to be inscribed on tickets.

Declaration of having no objects of value.

Tableau.

Number for objects deposited.

Clothes deposited.

Dirty clothes washed.

Patients severely ill to have first cares.

Quickness recommended in the admissions.

No omission or arrear allowed.

His books must be clearly, plainly, and neatly written, to render researches and references easy and certain in their results.

There ought to be no erasure, but if one at any time be necessary it must be initialed.

As soon as a patient presents his admission ticket it must be registered, and a copy made out with the addition of an inventory of all his effects, as well as of the number in the ward and the ward assigned to him. These two tickets are placed in two separate envelopes. The first when compared with the register and with their respective duplicates and signed by the medical officers, are sent (in an envelope with the number of tickets contained marked upon it) to the *sous-intendant militaire* for his signature; on their coming back signed, they are filed after they are counted over and their number verified. The tickets of issue on duplicates are the next morning compared with the number of the admissions of the day before, and when found to correspond, are placed in alphabetical order in a box for that purpose to serve for reference when required.

The *infirmiers majors* must every morning after the visit give to the *officier d'administration* an exact account of any transfer that may have been ordered by the medical officers. Every morning at 6 o'clock in summer, and at 7 in winter, the daily movements of transfer, admission, or issue, must be ascertained, registered, and compared with the reports of the *infirmiers majors*, and should any discrepancy be found it must be traced at once to its source and rectified.

Immediately after, the tickets of the men designated to be discharged next day after the visit, are taken out, carefully filled up, put into an envelope, and sent to the *sous-intendant*.

Every morning after the discharge of the men, each must be carefully struck off from the register and the daily statement.

The exactitude and regularity of these registers are of the highest importance, as they form the base upon which all the other accounts are founded.

The nominal account of all the invalids is controlled every day by the numeral, and the daily movements being reported every day on a monthly report, the final addition will show a number of days equal to the total of the days presented by the addition of the daily movements in the course of the month.

So the three monthly movements of each quarter must show a number of days equal to the total of the nominal rolls or current account, by corps, in which are registered all the men admitted, and all those gone out are deducted, showing all the days that every invalid remained during that quarter. It must be borne in mind that the day of the admission of any invalid, whatever was the hour of his admission, is reckoned as a day, while the days of the demise or issue are not reckoned. For instance, 20 days are reckoned for a man admitted on the first, and discharged on the 21st; 13 days for a man who had been admitted on the 4th, and gone out or demised on the 17th of the same month. After registering every day the admission or issues on the register and current account, the *officier d'administration* will count over the men admitted to see that they correspond perfectly with the tickets of admission. It is also a good practice to write an R (for registered) on the corner of each ticket of admission at the time of entering them on the registry, and draw the pen across the R on entering it on the current account, and in the same way a D (for deducted) should be written on the tickets of discharge.

Chapter 5th.

Demise.

As soon as the *officier d'administration* is informed by the *infirmier major* of a man's demise, he will cause to be brought to him the ward or admission ticket, signed by the medical officer who has verified

the death. He will then call for all the papers that the deceased had in his bed, his pocket-book, and if needs be the visit book, and take all the measures necessary to verify his identity.

Before drawing the declaration of demise, he will collect all the documents and submit them to the director. Each director must be furnished with a dictionary of all the parishes to verify the orthography and the identity of the parish of the deceased, and in case of doubt or mistake he must communicate with the corps to avoid errors in the registration of the demise and in the notice to be given to the family of the deceased. After the director's verification, the *officier d'administration* draws up the declaration which is sent to the civil authority, registers it in the demise book, and makes out the death certificate. Then they make out together an inventory of all the objects left by the deceased, and prepare the letter of advice for the mayor of the district where he was born or resided. In this letter must be included the details of all the objects left by the deceased for the information of the family. It must point out the formalities to be fulfilled to establish the claims to the property, mentioning the term allowed for sending in the claim, and the time when the sale and the deposit of its proceeds will take place, in case of no claim being made in due time.

Chapter 6th.

Every morning before the meat is put into the pot for the evening distribution, the *officier d'administration* charged with the admissions must establish the *weight estimate (la pesée)* of the meat necessary for the next distribution. This (*la pesée*) is the designation given to the return showing the patients that remain, with the addition of those newly admitted, and the deduction of those just gone out, demised, and on low diet.

On the evening before closing the office the weight of the meat is established for the next morning.

The weight is calculated for all the invalids and *infirmiers* according to the following form:—

Military Hospital of		185
Weight of meat		
Evening.		
Invalids	- - - -	}
Medical and administrative officers	- - - -	
<i>Infirmiers</i>	- - - -	
Patients admitted	- - - -	
Deducted.		
Dead	- - - -	}
On low diet	- - - -	
Remain		- - -
Meat to be put into the pot		- - -

Chapter 7th.

Rules for the Discharge of Men going out.

After the evening distribution, for the men of the garrison (if that is the usage) and every day very early for the others, the *officier d'administration* charged with the admissions calls to muster all those going out. If these are very numerous he collects them in an empty ward, or in a court-yard in summer; if not very numerous in his office. They must be accompanied by the *infirmier major*, who must ascertain that they have given up all that belongs to the hospital.

The *officier d'administration* will then proceed to see that they are properly dressed and that they do not go out until seen by the porter.

If there are many going out belonging to the same regiment all the tickets of issue are entrusted to the N. C. officer in charge of the men, or in default to the senior N. C. officer, corporal, or soldier in the lot, in which case the name of the party must be kept to refer to in case of need. Previous to their departure the *officier d'administration* shall see that they

receive each the portions they are entitled to. All these formalities must be gone through with the least possible delay.

Chapter 8th.

Personal Recommendations for the Officier d'Administration, on the Manner of receiving the Invalids, Necessity of preserving Order and Cleanliness in his Office.

The *officiers d'administration* must be well instructed in all the particular details of this branch of the service, be always ready to practise them, and to answer with precision any inquiry that might be made. They must be respectful to their superiors, polite to their equals, and kind to the patients, who are to be inspired with confidence and consoled for the loss of the assistance of their relatives in the melancholy circumstance of their malady.

The officers charged respectively with the admission of the invalids and the reception of their effects into the stores will do well to agree with and help each other in the respective discharge of their duties and never absent themselves from their offices, without leaving a substitute.

Chapter 9th.

Admissions on Transfer from other Hospitals.

Among the patients transferred from other hospitals there are always some very fatigued from the journey in need of immediate relief, and the *officiers d'administration* must first see that they are readily received and attended to. These hospital transfers being generally advised in advance, the *officier d'administration* must consult with the director to have a warm room ready (according to the season and the weather) to which the invalids must be directed. Having selected with the medical officer all the men requiring immediate succour, he will mark them on the transfer paper, and will cause them to be taken into the wards with order to the *infirmier major* to bring back the exact indication of the bed where each has been placed. Having fulfilled this first duty, he shall make out the ward tickets for all the others, marking them out each respectively on the (evacuation) transfer paper, and will direct them successively to the dressing room, where they shall deposit all their effects previous to their being sent to their beds. The ward tickets for those admitted on urgency shall next be made out, and a general receipt for all will be signed by the *officier d'administration* after having compared the tickets with the transfer paper, and called out each name, to mark the absent or missing, if any, and exclude them from the receipt. He shall then proceed to make out the duplicates, but before registering them he must first verify in the wards that they are all there installed in the beds indicated for each. The tickets being so verified and completed are compared with one another; then one is left at the bed of each patient, and the other serves to fill up the pasteboard label that is put on the *tableau*, and after being carefully registered they are put into the box in alphabetical order.

All these operations must be made with the utmost possible rapidity, and the *officier d'administration* will do well to engage all his colleagues and subalterns to give him a helping hand in the despatch of this business.

The admissions will be vouched in the accounts by the transfer return, which will show all those that were admitted on the same day. If some of the men should arrive the next day or after, having no separate return or report, on the verification of the cause of their delay, and in case of urgency, a ticket of admission can be made out for them referring to the general transfer return. If the individual cannot justify his delay, and is in a fit state to go to the office of the *sous-intendant*, he must be remanded to that officer with an extract of the transfer return duly certified and signed by the medical-officer on guard;

the *sous-intendant* will then decide if he is to be admitted. The *officier d'administration* must be careful in noting with exactitude all the former transfers from other hospitals that each patient may have undergone, as this serves to account for and justify his absence from the corps.

Discharge by Transfer.

For the departure of a transfer the *officier d'administration* must collect all the ward tickets of the men designated by the medical officer. He makes out from them the transfer report, while his fellow officer at the dressing stores prepares the effects deposited by the patients, to have them ready for delivery before the hour fixed for their departure. The next day before the time of the visit they must be all collected in a warm room, dressed for the journey, then ranged and mustered in the order as on the report, and after receiving their day rations, put into the carriages that are to convey them, taking care that the men more seriously ill be the first accommodated.

Any transfer of importance should be accompanied by an *officier d'administration*, in whose presence the men are mustered, and to whom the report is delivered in duplicate, to serve, one as issue return for the hospital they leave, and the other as admission return or ticket for the hospital they enter.

The *officier d'administration* in charge of the transfer must see that everything is in proper order, that the conveyance is sufficient and comfortable with straw and tilts; that the *infirmiers* and the drivers do their duty well, and that everything proceeds with the best possible order.

Chapter 10th.

Further explanations on the Tablets (Tableaux) and the Boxes used for the registering of Admissions.

The tablets (*tableaux*) are formed with pieces of tin about two inches and a half wide, fixed upon boards, one inch above the one another, thus forming a rack of as many plates as there are beds in each ward. The plates might be substituted by brass or other wire divided against each number in perpendicular order.

In the interstices between these plates or wires there should be placed a proportionate piece of pasteboard or thick paper, bearing the name, surname, and name of corps of the patient occupying the bed corresponding to the number on the tablet (*tableau*). These tablets are of the greatest utility as references in all circumstances, therefore they must be kept always in perfect regularity.

The box destined for the duplicate (issue) tickets must be large enough to contain easily a number of tickets equal to the number of the invalids that the hospital can contain; its width must be proportionate to that of the ticket, and its height two-thirds of it, to leave exposed the name and number, &c., so that the tickets being placed therein in alphabetical order can be referred to with great convenience.

INSTRUCTIONS for the LINEN and FURNITURE STORES.

Chapter 1.

The duty of keeping and distributing the linen is one of the most important in an hospital, and the person entrusted with it, being aware of his great responsibility and the confidence placed in him, must endeavour to justify it by his exactitude, watchfulness, and order.

It is necessary to form a good system of distribution and return of the linen from and to the stores so that all should come in turn frequently under the eye of the storekeeper, who by his constant attention will find means to ascertain that the linen is carefully used and preserved. The exact quantity will be easily

Linen-keeper's duties.

Necessity of a good system of distribution.

Book's regularity.

maintained if every piece delivered be duly entered in the register book ; and all those in the stores are well disposed and so arranged that he can at any moment ascertain their state. An account of Dr. and Cr. must be regularly kept with each ward, branch of the service, and washhouse, for the linen that is received or brought back, care being taken that none is ever left in arrear. Besides that for the linen, the storage of all the other utensils of copper, tin, zinc, wood, and woollen cloths require special attention as to the places being well fitted in all respects for the preservation of the materials, and sufficiently spacious to admit of their being properly stored. The accounts of all these objects must be kept with the same regularity as mentioned for the linen. The same for all the other furniture.

Utensils, storage, and accounts.

Furniture, mattresses, &c., &c.

Cares for their preservation. Negligence to be punished.

One of the special cares of the officers charged with the keeping of the furniture, is that of seeing that the furniture, and specially the mattresses of the deceased invalids are returned in good order and dry. If they are damp they must be put on trestles to dry, but if they are drenched with ejections or stained with blood, they must be undone and washed, both the case and stuffing, if necessary. The causes of such occurrence must be inquired into, and if it is the effect of negligence, which is generally the case, the person whose fault it is proved to be must be severely punished, as having failed in the fulfilment of one of his principal duties, that of attending to the best preservation of the furniture, and the cleanliness and comfort of the patients.

Inspections and reports.

The storekeeper must make frequent inspections in the wards to ascertain that the objects entered in the account really exist, and in what state. Any object that he may find in a deteriorated state must be at once changed, and any special case of negligence, or attention in the *infirmiers majors* or *infirmiers* must be reported to the director for his repression or encouragement for the good of the service.

Chapter 2nd.

Linen.

Administration of linen.

The administration of the linen is perhaps the most important, that being the material the most necessary, the most valuable, and the most abundant in a well-directed establishment.

The different objects must be disposed and classified separately in uniform piles, symmetrically arranged, and of easy access, in a dry and well-locked place.

Chapter 3rd.

Change of the Linen.

Changing linen.

At the time fixed for the change of the linen, the officer rings six bell-strokes to call the *infirmiers*, who hand over to him the lists of the dirty linen that they have to change against the clean.

They are then placed on a rank in the lobby of the storeroom, and each hands over the dirty linen with the usual precautions to ascertain the number and state of the linen delivered from each respectively, causing each to count and spread them all at the same time. When the linen is counted, examined, and placed on trestles, the assistant that has received it stamps the list with the word *right*, or marks on it the observations occurring. The *infirmier* takes it to the storekeeper, who hands him an exactly equal quantity of clean linen.

This operation must be done with the greatest accuracy and quickness, which can be obtained only by the great order and good arrangement of the things, which must be handy and regularly disposed.

Practice of making bundles, to be avoided.

The *infirmiers* must avoid the practice of tying the linen in a bundle into a sheet or other piece of good linen, but must strap them up together with leather or canvas.

Cares for dirty linen.

When the distribution of the clean linen is done, after having put in good order the clean linen store, the storekeeper must inspect the dirty linen store to see that it is made ready for the washing, and that the

wet linen is spread at once to prevent its deterioration in case it should remain some time in the stores.

The dirty linen stores should be at some distance from the wards.

Chapter 4th.

Washing of the Linen.

When there is sufficient linen dirty the storekeeper calls the washhouse keeper and delivers it to him, entering in duplicate in the account book all that is delivered.

The storekeeper should follow the linen and see that it is properly washed with the right quantity and quality of alkaline matters, and that it is regularly percolated and cleared. He should take care that the women do their work well, that they do not lose their time, do not beat the linen too much, or better that they do not beat it at all, and dismiss all those who do their work badly or indifferently. He should superintend the use of the soap and fuel, fix the quantities, and enter them in the book kept of the articles of consumption. He should inspect the linen on the drying lines, and cause all that he finds imperfectly washed to be washed over again.

When the linen is brought back clean into the stores it must be ascertained that it is well dried, and then is counted up as it is put into the empty cases already prepared to receive it.

Chapter 5th.

Classification of the Linen.

The storekeeper should classify all the linen under four separate categories, viz. :—

- 1st. Good or middling.
- 2d. Requiring little repair.
- 3d. Requiring much repair.
- 4th. Past service.

They must be distinguished at the washhouses by a different manner of folding for each class, and when returned to the stores they will be forthwith either stored or sent to the workroom, or to the loft.

Chapter 6th.

Linen Repairs.

The repair of the linen must form the object of a current account with the needle mistress.

The linen is delivered to her by number and weight, and she returns it in the same manner and quantity.

The storekeeper will direct her to keep the work of each needle-woman separately, that he may see the kind and quantity of work that each does, and judge which deserves to be retained in the service, and which to be discharged. He will furnish them all, through the mistress, with the quantity of thread, needles, &c., &c., necessary for each week, keeping an account for all.

For large repairs a special number of hands must be employed to prevent any interruption taking place in the minor repairs, which must go on uninterruptedly and constantly as the linen comes in from the washhouse, with which they must keep pace, without mixing the different batches. The parties engaged in the large repairs shall receive from the storekeeper the necessary quantity of pieces for the repairs. Both the linen to be repaired and the pieces must be weighed separately on delivery, and the linen mended with the remnants afterwards will give the same weight, with some little difference for possible waste.

The repairs must be well sewn, well sorted, and made with intelligence, economy, and nicety.

Also the linen to be cut for the dressing is given and returned by weight. The weighing of the linen is of the utmost necessity to prevent the abuses that frequently take place without such precautions.

The workwomen must be all inscribed in a register and none shall be admitted unless with the permission of the director or storekeeper. The first needle mistress or workwoman shall keep a book in which

she is to note all day's or fraction of day's work made by each workwoman, who must have her separate page.

Chapter 7th.

Linen repairing Work-room.

The workroom for the repairs of the linen, and for cutting the dressing linen, is under the direction of a work mistress.

She keeps an account with the storekeeper, and is responsible to him for the quantity of linen she receives, as well as for the work done by the workwomen under her. She shall furnish them with the necessary materials, and inspect all the work they do, to see that it is made properly, and where this is not the case, cause them to undo it and do it over again, deducting from their wages the time so lost. An assistant mistress will help her in the discharge of her duties, and be always there when she is obliged to go out, as it should never happen that both absent themselves at the same time.

They will watch jointly over the conduct and decent dress and behaviour of the workwomen, and accompany them whenever any of them are going to the stores.

They will mark for deduction from the wages any absence of the needle or work-women, besides the time allowed for their meals.

The hours of attendance for the workwomen are as follows:—

From 7 a.m. to 5 p.m. from 1st November to 1st March.

From 6½ a.m. to 5½ p.m. in the months of March and October.

From 6 a.m. till sunset from 1st April to 30th September.

At mid-day they will be allowed an hour for their meal, and from the 1st of April to the 30th September an extra half-hour will be allowed them for rest and refreshment in the afternoon.

At that time they can go out, but must punctually return at the fixed time.

The wages may be rated either by the work or by the hour, and proportionately to the skill of the workwoman. The strictest order must prevail both in the personal and in the material in the work-room.

The different linen either for much or little repair, or for dressing, must be kept in separate presses or chests, and no work-woman must be allowed to leave the place, unless she has first folded and put by her work into the place assigned to each respectively by the mistress or her assistant.

Chapter 8th.

Accounts.

The storekeeper must keep a ledger in which he must open an account for each article of furniture, taking care to leave more space for those that are likely to require more frequent changes. Changes must be noted the same day on which they take place.

Besides the ledger he shall keep a day-book in which all articles are entered in a Dr. and Cr. account under the day's date with the relative prices from the invoices showing all expenses and receipts.

Also he must keep a Dr. and Cr. account with the washhouse-keeper who will keep a duplicate for all the linen delivered or received. Another book must be kept in duplicate with the washhouse-keeper, to register the day's work of the washing people. A similar book shall be kept in duplicate with the linen-mending mistress for the day's work of the workpeople under her. A separate book in duplicate must be kept also for the articles of consumption for each department, such as soap, potash, &c. &c., for the wash-house; thread, needles, worsted, &c. &c. &c., for the linen-mending workshop; and as many books as required on the same system to be kept in duplicate with each *infirmier major* or other chief of service, of baths, kitchen, purveying dispensary, wherever there is furniture, or deliveries and returns of supply take

place. From all these books the storekeeper must extract monthly statements for the director.

On the 1st January and the 1st July of each year, and oftener, if required, he must make up a statement with an estimate for all the articles of linen, wool, wood, or metal requiring repair, each category separately, with an indication of the old materials which can be employed for the reparations. An *expert's* certificate and signature must accompany this statement and estimate; also a separate statement and estimate, bearing the certificate and signature of the medical officer, must be made for tinning the copper vessels.

Another statement and estimate with indication of the materials, both new and old to be used, must be made out by the storekeeper and certified by the surveyors' *experts* for the repairs and beating of mattresses, bolsters, &c., &c.

After the mattresses, &c., &c., are beaten, washed, and repaired, the weights and quantities used, and the deficit, if any, for tear and waste, must be all accounted for, and certified with the surveyors' *expert's* signature, for each item particularly.

The *expert's* fee and every other expense must be included in the estimates. All changes consequent on these works must be immediately registered.

At the Spring season, the storekeeper, with the consent of the chief medical officer, shall substitute the linen trowsers and cotton socks for the woollen ones, which he will cause to be cleaned and repaired, previous to returning them into the stores. At the same epoch he will remove also the second blankets from the beds, leaving in the wards the cleanest, and proceeding to the cleaning and repairing of the others, which must be done immediately, without losing time. After having caused a distinction to be made between those more or less dirty, requiring to be washed with clay, or fuller's earth, or with soap, or even ox-gall, he will inspect them after they are washed, to see that they are properly cleaned, otherwise he must cause them to be washed again before returning them into the stores.

The storekeeper shall make frequent visits in the wards, to ascertain that the *infirmiers majors* and *infirmiers* carry out their instructions for the good preservation of the furniture.

INSTRUCTIONS for the STOREKEEPER of INVALIDS' EFFECTS.

The storekeeper of the invalids' effects must use, with the help of his fellow officer charged with the admissions, the greatest care and regularity in the registering of all the effects belonging to the patients. The state of the effects can also be distinguished with some initials, such as *N*, for new, *G*, for good, *B*, for bad, and *W*, for worn out, &c.

The admission office must be always furnished with the moveable numbers corresponding to the vacant numbers in the effects' stores, and one is stuck upon each bundle.

All the effects must be made into a bundle, with great care, so that none of them get loose and be lost.

The shirts alone are to be left out to be washed, before they are enclosed in the bundle.

To prevent mistakes, a cloth number, corresponding to that of the bundle, is stitched upon each shirt before sending it to the wash-house, and when it is returned clean, it is tied up together with the other effects. A special book must be kept to enter the shirts given to be washed, against the name of each patient, and the number on his bundle and the shirt. A duplicate of this book shall be kept by the washhouse-keeper. Each day, without delay, these entries must be regulated with exactitude, and each evening all the bundles must be removed from the undressing room into the effects' stores. The same number must be endorsed on the admission and issue tickets bearing the description of the effects deposited.

Monthly extracts of books for the Director. Half-yearly states and estimates for furniture and certified by experts.

Beating mattresses.

Expert's fee.

Spring changes of woollen or linen and furniture.

Blankets washing.

Inspection of wards.

Care to be given to invalids' effects.

Numbers assigned.

Made into a bundle carefully.

Shirts washed.

Cloth number stitched on bundle.

Special book for shirts. Duplicate shirt book.

Number of bundle added to the admission and issue tickets.

Delivery of effects on issue.

Store-keeper takes care of the effects of demised patients. Special list for demised. Arms to be taken care of.

Number on bundle to be preserved.

Soiled effects to be washed and cleaned.

Effects of men under infectious distempers to be subjected to depurative fumes.

Cleanliness and ventilation of store-rooms.

Beating and brushing effects.

Chlorine used to disinfect rooms.

For the issues, as soon as the issuing tickets for the next day are signed, the store-keeper of the effects takes out their respective bundles, sees that they are in perfect order, and delivers them to each, half an hour before his departure, making him recognize and acknowledge the receipt of all his effects in the same state as he deposited them, to avoid every possibility of complaint for the future.

In case of demise, the store-keeper will cause all the effects that are found in the ward belonging to that individual, to be delivered to himself; he will add them to his register, putting them with the others in the same bundle in the stores. He will keep a special list for the deceased men, or make a special mark for them on the general list.

The arms that may happen to be deposited by the invalids should be preserved with particular care, to keep them free from the rust and damp. They must be rubbed before being packed, with a piece of greased cloth, and this should be repeated every month, wiping them clean with a dry rag before returning them at the time of the departure of the owner.

The greatest attention must be paid that the moveable number stuck upon the bundles is never removed, or detached until the time of returning them to their owners.

Besides the regular washing of the shirts, all the other articles must be subjected to a cleaning process whenever soiled with dirt or blood, taking care to attach upon each piece a number corresponding to that of the place assigned to the effects of that individual.

All the effects of those having the itch or other infectious distempers, must be first sent to the depurative room, and subjected to the action of the fumes of sulphur or chlorine.

The greatest cleanliness and ventilation are most important in the stores of the effects, to prevent their being injured and infested by insects, or contracting infectious qualities, or noxious and disagreeable smells.

Beating and brushing is much to be recommended, and should in spite of all precautions some bad smell prevail in the room, or in some part of it, an application should be made to the director that he may order the chief dispensary to furnish the necessary chloride to be used in that department.

Before using this substance, all arms must be removed, to prevent their being oxidated.

Cow and bulls meat, very young calves, old rams and ewes, heads, tongues, plucks, feet, scrag-ends, too pale, too deep, or uneven coloured meat, and the internal fat or tallow, all must be rejected. The meat received must be nicely cut to avoid waste, the bones sawed to avoid splinters.

The bread when not authorized to be white, must be of a shade not displeasing to the eye; must be made with wheat flour of the first quality, sifted so as to extract 22 per cent. (of bran). Each loaf when cold should not weigh more than 3 lbs, ought to be well raised, having about five inches in the centre, and not more than one or two kissing-crust sides, and on being cut must emit an agreeable smell, and show many sponge-like holes, and have a pleasing flavor. It must be delivered clean and brushed from all strange substance on its exterior, and always rejected if burnt or not sufficiently baked or containing any mixture or having any bad smell or taste.

Wine must be received with the greatest caution. On making a contract the quality must be submitted to the approbation of the chief medical officers with a sample, and on signing the contract, a number of samples equal to the number of the probable deliveries must be submitted and sealed, to serve as a test at each delivery. Any wine defective in brightness or tasting sour or thick, or detected to be mixed must be rejected.

Rice must be of the quality known in commerce as common good, the grain whole, transparent, clean, free from the husk, well winnowed. Any rice having a bad smell or being dusty or broken, must be rejected.

Salt must be quite dry, and pure from any earthy or sandy mixture, and when dissolved in hot water should not affect its transparency.

The butter, either fresh or salted, must be of the best flavour and quality.

The eggs must be examined against the light, to see that they are quite fresh.

The oil for burning, must be vegetable and pure.

The candles must be rejected unless they have a thin wick, and are quite dry and hard.

The potatoes must be mealy, and middle-sized. These, as well as the vermicelli, rice-meal, gruel, and all other starchy substances, must be submitted to the experiment of being boiled, which facilitates the detection of any defect that they may have.

The *officier de dépense*, shall always consult on these subjects with the chief medical officers, as well as with the director, who must be informed of every transaction taking place in the steward's department.

Chapter 3d.

Next in importance to the choice of the quality of the provisions, is their good preservation and preparation.

Cleanliness is one of the means best conducive to their preservation.

The slaughter-house must be kept eminently clean, perfectly dry, and ventilated. It is necessary that in summer, the windows, or any other opening, be furnished with frames, upon which thin canvas or network is stretched, to prevent insects from coming in. The blocks, tables, scales, and weights, must be kept in a perfect state of cleanliness. The meat hanging from hooks should never touch the walls, and when necessary to hang it close to the wall, a wicker-work mat should be placed between, to prevent the contact of the wall. These mats must be frequently washed with soda.

The cleanliness of the pantry is not less necessary; it should be kept dry, but not so much ventilated as to dry the bread. The boards upon which the bread is placed must have a wooden rail against the wall, to prevent the bread touching it. The table upon which it is cut, as well as all the other utensils, should be kept with the most scrupulous cleanliness. Everything should be kept under glass lids or covers.

INSTRUCTIONS for the OFFICIER DE DÉPENSE.

Chapter 1st.

General Duties and Qualities.

Officier de dépense, duties and qualifications.

The post of *officier de dépense* is one of the most important and of the greatest responsibility in the establishment. Having to survey all the provisions brought in for consumption as to their quality, quantity, good preparation, and preservation, he must be a man of tried integrity, of kind but firm disposition, quick understanding, right judgment, and solid memory. He must be a good accountant, and a good judge of the qualities and prices of all the articles of consumption.

Chapter 2d.

Meat, its qualities.

The meat is one of the most essential articles to which the *officier de dépense* has to give his attention.

Good meat must have a fine rosy colour, neither too deep red, nor too pale.

Average oxen weight.

Good oxen should weigh alive not less than 500 lbs., calves not less than 60 lbs. In receiving the meat it must be observed, that the fore and hind quarters are in equal proportion, the hind quarters being the most fleshy.

The meat must be brought in 24 hours after being slaughtered.

After insuring the good quality and preservation of the provisions, it is necessary to insure also their good preparation, therefore, the *officier de dépense* will use every means to make the chief cook feel its importance, and exert himself to perform his duties in the most perfect manner.

Nothing should come out of the kitchen without the *officier de dépense* having tasted it first, and approved. Should he find anything badly prepared or cooked, he shall prevent its distribution, informing the director of the circumstance, that he may apply a remedy.

The *officier de dépense* shall daily inspect all the vessels used for cooking or distributing the provisions, that they are all in a perfect state of cleanliness and preservation, whatever may be the material of which they are formed.

The same care must be had for the vessels containing lamp oil.

Chapter 4th.

Distributions.

Having ascertained the good quality and good preparation of the provisions, the *officier de dépense* will make himself sure that they are properly distributed.

After having received from the *infirmier major* the list of all the *infirmiers* that are to receive their food, he will give their number to the cook, and after he has received from the admission office the weight of the meat for the evening distribution, he shall see it weighed, and follow it to see it put into the pot and locked in, giving the key to the sergeant on guard.

He hands over to the cook also the rice, plums, potatoes, salt, &c., &c., and all that must serve for the morning distribution.

He keeps a book in duplicate with the cook, where all that is delivered is put down.

He will deliver to the cook the quantities in abundance, taking as his basis the distribution of the preceding day, and after the distribution when he receives the returns of the new admissions, he compares the numbers of the distributions and the total of the patients, and sees that all the portions in excess are returned to the pantry to be preserved for the ensuing distribution. The same should be done with regard to the low diet, such as rice, plums, vermicelli, vegetables, wine, bread, &c., &c.

The distributions will be performed, as described in the instructions for the *infirmiers majors*, under the direction and survey of the *officier de dépense*, who after the return of the surplus portions into the pantry will put it in good order with the help of his assistant. He will then proceed to make and deliver a report for the director of the distribution executed, and then he will proceed to begin the preparations for the next distribution, that he may do all with leisure and without confusion. Besides his regulating and surveying the use of the provisions he will also control the use of the fuel and of all the articles used by the cook, with whose instructions he must be familiar, to be able to control him in the fulfilment of his duties.

Chapter 5.

Various Details.

The *officier de dépense* has to direct the regularity and supply of the lighting. He has to attend personally the delivery of the oil, which he must see poured into the very lamps or vessels that should be brought to him in trays expressly made. These vessels must be emptied into a special filter every morning, wiped and cleaned before they are filled up again with fresh oil.

The *officier de dépense* shall deliver for each lamp a quantity of oil proportionate to the size of the lamp, the wick, and the length of time it has to burn.

The oil, when impure, is purified by mixing with it a hundredth part of sulphuric acid, stirring it well, and adding to it afterwards an equal quantity of water, stirring it well again. When the oil floats, it is decanted and filtered.

He must have therefore a scale of measures proportioned to the length of the nights for each size of lamp used.

He will cause the wicks to be prepared as described in the instructions for the *infirmiers majors*, always keeping a sufficient stock ready made.

He shall give a special care to the safe, and the preservation of the provisions contained in it. He shall take care that the provisions preserved there are always distributed the first at the ensuing distributions. Every day he must hand over to the director a report of the distributions and receipts with the relative vouchers.

He shall furnish the cook with a duplicate book having a column for each article, for which he may have to make a requisition in which every requisition shall be noted. He must allow nothing to remain in arrear in his books.

He must use his foresight in keeping always a sufficient stock continually in hand, renewing it before it is exhausted so as to be able to refuse any article that is not of perfect quality.

Safe, preservation of provisions.

Report to the director, with vouchers.

Duplicate books, in columns.

No arrear in books

He must keep stock always in hand.

INSTRUCTIONS for an OFFICIER D'ADMINISTRATION superintending a DISCHARGE or TRANSFER.

Chapter 1st.

General Duties.

Preparations for the Departure.

The *officier d'administration* superintending a discharge or transfer is responsible for all the ambulances under his direction, from the moment of their departure till their arrival at the hospital to which they are directed. He must, therefore, make all the necessary arrangements, that the invalids may suffer as little as possible during their journey, and that everything may be prepared for their relief in case of need. He must, therefore, have a sufficient number of *Infirmiers* under his orders, proportionate to the number of the invalids and the gravity of the cases, and in ordinary circumstances at least two for each carriage.

Departure on transfers.

He must firstly inspect all the carriages, to make himself sure as to their solidity; that the horses are well shod, well put to, and all in good state to fulfil the journey.

Inspection of carriages.

He shall receive a duplicate transfer report from which both he and the medical officer in charge will see what provisions they must make, to have the necessary number of carriages, quantity of straw mattresses, blankets, dressing apparatus and materials, food and drink, and one or more stretchers; all these objects he will obtain on requisitions in duplicate from the director, one of which may serve as invoice for the director of the hospital where they are transferred, if the objects are to remain there; if they are returned back the invoice will serve for the *infirmier* in whose charge they may be returned.

Duplicate report.

The *officier d'administration* must use his intelligence in making the preparations for the comfort of the invalids on the carriages with regard to the season, and provide shelter against the rain and cold air in winter, and against rain, dust, and sun in summer, making the best of the means at hand.

Measures to be taken for the comfort of the invalids.

When all is ready to start he shall cause the worst invalids to be placed comfortably on the carriages, and will then proceed to call out all the names from the nominal roll, causing each to take in succession the place respectively assigned to him, without confusion, as he is called out. Every one must keep his place throughout the journey, and no change of place may be allowed without the *officier d'administration's* special authorization, who will of course grant it on reasonable grounds, and will not oppose friends to be together without a special reason.

The number of the patients must be equally divided among all the carriages, and so also the luggage, taking care that all the arms are unloaded, and that none of the effects of the invalids are left behind.

Patients equally divided in the carriages.

Carriages numbered.

The carriages must be numbered in succession, and each keep the same order during the journey.

The number of each carriage is put down on the transfer report. When all this is done the *officier d'administration* gives the signal to start.

Chapter 2nd.

On the Road.

Carriages to follow each other closely.

The carriages must closely follow one another, and never go abreast. They shall all go a good walking step, without ever trotting or galloping.

Drivers must not stop without leave.

The drivers shall never stop without asking the *officier d'administration's* leave, and he will regulate the halts so as to meet the wants of the patients, and the rest that the horses may require. He will keep in the middle of the convoy, going frequently to the other carriages to see the state of the invalids carriages and horses.

Infirmiers to be in sufficient number and ready to assist the invalids.

The *infirmiers* in proportion to their number must be so disposed as to be always in readiness to give help to those that require it; and each shall be attached to a carriage or carriages, from which he will not be permitted to absent himself for any time.

Officier d'administration to know all particulars of the road, and measures he is to take.

It is necessary that the *officier d'administration* be well informed of all the particulars of the road, about villages, mountains, rivers, woods, inns, &c. to avail himself in procuring the advantages and avoid the inconveniences that they may offer. This knowledge will be of the greatest importance to regulate the halts, which must be as few as possible, with due consideration to the want of rest both of patients and horses. Halts should be made in quiet solitary places in preference to populated villages, where some of the patients or the drivers might be tempted to go about, and indulge in drinking or other irregularity. During the halts he will inspect with the medical officer all the patients and carriages, to provide for their wants and arrange whatever might have got out of order, and to make sure that all are present. With the consent of the medical officer some of the invalids may be permitted to walk part of the way, but they must be given in charge of some non-commissioned officer or the senior in service, and caused to precede the convoy. In going through a village they must get into the carriages or form in regular lines and platoons, that none may straggle.

Halts.

Provisions to be taken for invalids incapable to continue the journey.

If during the journey any of the invalids should be so unwell as not to be able to continue it, the *officier d'administration* will make the proper arrangements with the medical officer, and shall apply to the mayor of the first town they pass to take the patient under his charge, till he may be conveniently removed to the hospital upon which he was directed.

If the mayor has not convenience to lodge the patient, he must be placed at some inn with one of the best *infirmiers* to take care of him. In both cases the *officier d'administration* shall get a certificate from the mayor or his adjunct, testifying the determination taken and the instructions given with regard to the invalid left.

To avoid all delay for the convoy, either the *officier d'administration* or the medical officer will remain to make the necessary arrangements for the patient in danger, while the other will proceed with the convoy, of which he must take all the direction till the officer remaining behind overtakes them again.

Distributions.

Should it be necessary to make a distribution during the journey, or to pass a night in some place between the two hospitals, the places for stopping must be indicated by the *sous-intendant militaire*.

If the weather is fine the distribution can be made in the open air, otherwise it must be made under shelter. In case of distribution on the road all that is necessary for it must have been prepared before starting, and all relating to it must have been the subject of special instructions from the director.

The portable soup-cakes, or cakes of *consommé* should be used in such circumstances to save time, and because they are easily conveyed. The vessels that may be borrowed in such circumstances must be used and returned very clean, and any damage done to them should be made good punctually together with the price agreed for the hire.

The best means for making these distributions in the shortest time and with the least inconvenience for the patients, must depend on the contrivance and ingenuity of the *officier d'administration*, who will do the best under the circumstances.

If the convoy stops on the road, care must be taken that sufficient room is left for other carriages to pass; if they must stop round a corner, care must be taken that carriages that have to turn the corner may not come suddenly in contact with any of the carriages and thereby produce damage.

The carriages, when stopped, must never be left without a guard to watch them.

If it is foreseen that they must pass the night in some place before reaching the hospital to which they are directed, everything should be prepared beforehand. If it is by some unforeseen circumstance that they must stop on the road, it will lie with the *officier d'administration* to make the best possible arrangements for the comfort of the invalids. Also if by some extraordinary circumstance the necessity should arise for going beyond the intended resting-place, the provisions prepared at such resting-place for distribution, must be taken with them to be distributed when they halt.

On approaching the resting-place, or the place of final destination, it will be useful to send an *infirmier* in advance to announce their arrival, that all may be found ready for receiving them.

The distance between the carriages must be neither more nor less than that of a horse.

If in consequence of some accident or fatigue, some carriage must be left behind, the officer must leave it in charge of one of the most intelligent of the *infirmiers*, taking note of the carriage, and of each of the men with it.

The officer that has the direction of a transfer or discharge convoy, must exert himself that all proceed in the best order, keeping all the men and the horses well provided for and in good spirits by his foresight, benevolence, and good treatment.

Chapter 3rd.

Duties on Arrival.

The *infirmier* that has preceded the convoy, or if he be too tired some other person, must be sent back to meet it, and lead it to the resting-place or hospital, and give the necessary information, that the officer may the better give his orders to the drivers.

The carriages must be led into the court, or in default of a court, they may be left outside with a guard. The patients must be immediately got out with the same order as they have got in, and when all out, they must be called to muster to ascertain their number with the director of the hospital.

The carriages must afterwards be visited to see that all the effects have been taken down and given to the patients, who shall be asked if they have all their effects. The articles belonging to the hospital shall be given in charge of a trustworthy *infirmier* to take them back unless they are intended to remain where they are.

If it is a temporary lodging, the officer must see that the patients are all comfortably lodged, with sufficient air, as also the horses and drivers, and that all have their proper nourishment and rest, to be ready to resume their journey the next morning. One half of the *infirmiers* shall sit up alternately to attend on the patients during the night. If it is the hospital to which they are transferred, after having lodged the patients, the officer will obtain a receipt for the men and effects, on the report of transfer, from the director.

Chapter 4th.

March through an Enemy's Country.

When a transfer (*evacuation*), is performed in a foreign country and amongst an unfriendly population, the *officier d'administration* must deeply reflect and consult with the medical officer upon the emergency arising of leaving behind any of the patients, which must be done only when the circumstances of the

case render it absolutely indispensable, and when it is utterly impossible to have them carried by the *infirmiers*, or even by hired men of the country. If a patient can be carried by the men of the country, either hired or forced to do so, the greatest vigilance must be practised over them to save the patients from the effects of their awkwardness or unwillingness. In this event of crossing an unfriendly country, the convoy should be always accompanied by a sufficient escort, or a sufficient number of *infirmiers* to act instead.

The *officier d'administration* ought to speak the language of the country, otherwise he must be furnished with interpreters and guides who know well the country they have to cross, and who will give him reliable information.

He must avoid passing through populated hostile towns as much as possible, or being obliged to do so, he must send forward men to predispose the people in his and the patients' favour, by impressing upon their minds the idea that he would be ready to resist an attack. A certain number of guides and videttes should always proceed in advance on the flanks and rear, to explore and forewarn of any danger or surprise with precise information, that he may take in time measures to avoid or diminish the danger that may be threatening. If attacked by a superior force, without any hope of relief in time from any part, the best thing that can be done is to surrender; but if by offering some resistance there may be a chance of attracting some friendly help, he should dispose his available men for the defence to give time for the succour to arrive. The greatest care, however, must be taken not to endanger the lives of the patients by a useless defence. If, on surrendering, the *officier d'administration* be offered his liberty, he must decline accepting it, and remain with his countrymen who want his assistance, as well as the *infirmiers*, whom he must endeavour to have considered as *non-combattant*, and continued in the service of the invalids.

The directors of both hospitals must on their side make all the necessary provisions to facilitate the performance of the *officiers d'administration's* duties, which cannot fail to be very heavy and fatiguing in a journey of some distance, giving his whole energies to the welfare of the invalids entrusted to him.

INSTRUCTIONS ON THE WAR SERVICE.

Remarks on the Service of the Army Hospitals.

Flying Ambulance.

The flying ambulance is composed of a light cart placed at the vanguard with two surgeons, one *officier d'administration*, and two *infirmiers* to bring succour wherever it is wanted.

If the nature of the ground prevents approaching it with the light cart, two of the baskets, numbered 2, 3, 4, must be taken out of the carts 2 to 5, as hereafter described, and loaded upon one of the horses of the team, by means of a *bât* contained in the store cart (*caisson magasin*).

To render this service available, it would be necessary that all the *personnel* be mounted to afford timely succour to the light troops whose march is the most rapid.

Ordinary Ambulance.

The ordinary ambulance consists of five carriages, numbered 1 to 5 as follows. Carriage No. 1, on springs, contains in its body 40 surgical apparatuses, each of which may suffice for 25 ordinary dressings. Between the body of the carriage and the roof are various bandages and apparatus prepared with linen for great and little dressing, lint, splints, and other objects considered necessary for 400 dressings. Under the same bower are placed a dispenser's canteen, an amputation-box, another with reserve knives and two stretchers.

This carriage, whose load is only 850 lbs., having materials for 1,400 dressings, can be used as a light or flying ambulance wherever a carriage has access. The three carriages, Nos. 2, 3, 4, are perfectly identical in their composition. On each of them are stowed:—

1st. One large case, at the back of the carriage, whose lid falls down upon the forage-box, thus presenting a table in front of a press, with compartments containing different bandages and apparatus prepared for use, a box of medicaments for first succour, a box for amputation, a box of reserve knives, splints, pallets, feet and leg bandages, and all the articles necessary for every kind of dressing.

2nd. A box of equal size, No. 8, placed in front of the carriage, contains blankets, aprons, napkins, towels, rope, string, and lint; a box of wax candles, tallow candles, and soap; a bag of tools, and on the top of the lid a spade, an axe, and a pickaxe. The space intervening between these two cases is filled up by 12 cases or baskets, whose size is equal to one quarter of that of the two mentioned ones.

3rd. The cases Nos. 9, 10, 11, 12, 13, and 14, ranged on two lines on the bottom of each carriage, form the inferior plane of that space, and contain, rolled up bandages, compresses, and lint.

4th. Case No. 7, placed on that No. 14, contains copper, tin, and iron vessels for the preparation and distribution of food and draughts.

5th. Basket or case No. 6, placed on case No. 13, contains rolled up bandages, compresses, and lint.

6th. Baskets or cases No. 2, 3, 4, 5, placed on cases 9, 10, 11, 12, are for two-thirds filled up with the same materials, with the addition of two square bottles containing, one a quart of vinegar, and the other a quart of brandy.

The upper third part of these baskets contains an apparatus similar to each of the forty contained in the first or light ambulance carriage.

7th. Lastly upon all these cases and baskets are placed two stretchers and splints. Each of these carriages contains materials sufficient for 2,000 dressings, and its load weighs about 1,340 lbs.
